

2018 Book of Accepted Abstracts

ACSP Annual Conference
October 25-28
Buffalo, New York

*This book includes only the abstracts accepted for presentation at the 2018 Annual Conference in Buffalo. This book was completed and posted to www.acsp.org on June 19, 2018.
Updated July 6, 2018*

Conference Theme:

The Continuing City: People, Planning and the Long Haul to Urban Resurgence

Buffalo has been the subject of a recent spate of “urban comeback” stories in the national press. Typically, these stories leave an impression that Buffalo’s recovery from long-term economic, physical, and social decline has somehow been a sudden thing. Like most planners, many of our citizens understand that improvements in the quality of urban life are the result of persistent and recursive planning and action across decades. Local conversations, like contemporary academic discourses, also acknowledge that these improvements are ongoing, partial, incomplete, and unevenly distributed.

Buffalo is currently enjoying an apparent explosion of new housing in and around our downtown. It seems sudden but center city housing has been a continuing focus of discussion, planning, and action for the past 40 years. And that’s only one example of how we can better understand the dynamics of planning and action when we look at them over “the long haul.”

The theme of The Continuing City will provide us with an opportunity to tell our stories while it invites others to share theirs, all within the longer temporal frame the theme suggests. This can be as appropriate to growing cities like Houston, Washington, or San Francisco as it is to our kindred “rust-belt” cities like Detroit, Pittsburgh, and Cleveland or disaster-battered cities like New Orleans. All have been made and remade in an ongoing way. In any of these cases planning plays a crucial role as governments, citizens, developers, and others strive to shape the future of their cities, year after year and decade after decade.

The temporal frame of “the long haul” also encourages participants to look at the development and propagation over time of ideas about the city, the role of embedded professionals and activists (Jane Jacobs’ “people who stay put”), the growth of specific (and local) knowledges in city-making, the long term development of advocacy organizations, the construction of procedures and protocols of participation and planning, the development of the institutional bases for planning, and the evolution of the physical and social city itself.

At the same time, The Continuing City theme urges participants to look forward, not just by years, but by decades, even centuries. If we got to where we are today through sustained action, long struggle, and continuous development we can imagine more distant futures by projecting the same kinds of step-wise processes forward.

Notes about this Book

This book includes only the abstracts accepted for presentation at the 2018 Annual Conference in Buffalo. This book was completed and posted to www.acsp.org on June 19, 2018 and updated July 6, 2018.

Abstract ID

When submitted to the abstract management system, each abstract was assigned an abstract submission ID number for administrative search/find purposes. This is the number that authors should reference to staff with any questions regarding their abstract, their presentation, or their final paper submission. This number stays with the abstract throughout the process and becomes the ID of the presentation of the research at the conference.

Proposal

Organizers of pre-organized sessions used the abstract submission system to provide an overview or intent of the session, the name of a proposed discussant, and the authors and paper titles of those confirmed to be part of the session. The system assigned a proposal number to the grouping of these abstracts. This number stays with the session throughout the conference. When scrolling through this book and through each track, you'll find the pre-organized session proposals listed first followed by numerically ordered accepted abstracts within that track. The abstract will indicate if it is related to a pre-organized session.

Indexes Available

Separate indexes for Author Name and Keywords reference the Abstract ID #. These indexes can be found at the end of this book.

Order of Abstracts within Each Track

Abstracts are first ordered by the type of abstract.

- 1) Roundtable Abstracts
- 2) Pre-organized Session Summaries – the overview describes the intent of the session; followed by...
- 3) ...Abstracts for the papers within the pre-organized session
- 4) Individual Paper and Lightning Presentation Abstracts
- 5) Poster Abstracts

Order of Authors

The abstract management system used by ACSP allows for author role declaration.

- **For paper and poster abstracts** - Authors of abstracts in this book and in the final program will be indicated as presenting, primary, or co-authors of the paper. The presenting author is always listed first. No more than eight authors for one paper are included.
- **Roundtables** will have a moderator. The remaining names listed are confirmed participants of the discussion. Anyone in the audience can also participate in the discussion as well. There is a maximum of eight names listed for each roundtable.
- **Pre-organized sessions** will also have an organizer and some at the publishing of this book will have a proposed discussant. This proposed discussant has yet to be confirmed and their participation will be verified prior to the schedule of presentations being created.

Multiple Program Placement Policy

Multiple abstract submissions on behalf of one author will be reviewed and may possibly be accepted and included in this book. However, more than one presentation of a paper and more than one appearance as a roundtable participant during the conference will not be allowed on the final schedule of presentations. It is, however, possible to present both a poster and a paper, if both proposals are accepted.

Participants on the final program will be limited to:

- one presentation of a paper whether in a formed paper session, in a lightning session, or involved in a pre-organized paper session;
- one placement on a roundtable;
- one placement as a discussant of a paper session; and
- one placement in the poster session.

These roles are not interchangeable. If you have more than one submitted paper abstract accepted and are invited to participate on more than one accepted roundtable, in fairness to everyone, we will ask you to limit your participation.

Requests for Edits

All abstracts in this book are unedited and published as submitted by the author(s) for peer review. It is the policy of the ACSP that the abstracts will not be edited. If information is missing about an author, it may not have been provided when submitting the abstract. We do understand the importance of names; that paper titles change as time goes on; and authors are added or dropped. In these instances, any necessary changes for the final program should be sent to abstracts@acsp.org. Updates to this book are not made immediately.

Searching this PDF

This document is 1091 pages long including the Author Index and Key Word Index. In order to find something quickly, copy and paste the titles below in the search box, or use the indexes to search for abstract ID numbers or authors by last name.

To access the search box, use your keyboard Ctrl F.

- Search by Abstract ID: Type the words “Abstract ID: with one space followed by the number. If you try to search for just the number, you’ll likely find it in many of the bibliographical references provided by authors. Sample: Abstract ID: 12
- To scan an entire track, use the word Track followed by a track number 1-15. Sample: Track 14
- To get to the Author Index, search for Author Index
- To search by key word, search for Key Word and then scroll alphabetically.

Quick Reference

TRACK 1 - ANALYTICAL METHODS AND COMPUTER APPLICATIONS

ROUNDTABLE: WHO BENEFITS FROM “SMART CITY” TECHNOLOGIES? HOW CAN THEY BE A PIECE OF THE PUZZLE TOWARD SOCIAL AND ENVIRONMENTAL JUSTICE?

Abstract ID: 293

Roundtable

HERIS, Mehdi [University of Colorado Denver] mehdi.heris@gmail.com, moderator

ANDREWS, Clinton [Rutgers, The State University of New Jersey] clintonjandrews@gmail.com

SCHWEITZER, Lisa [University of Southern California] lschweit@usc.edu

SANCHEZ, Tom [Virginia Tech] tom.sanchez@vt.edu

MCDOWELL, Ceasar [Massachusetts Institute of Technology] ceasar@mit.edu

BOEING, Geoff [University California, Berkeley] gboeing@berkeley.edu

The “Smart City” concept is increasingly receiving attention and investment from the planning practice. Many cities have established partnerships with companies that are implementing such technologies, ranging from collecting climate-related data to providing real time transit data (IBM, 2017). Technologies such as the internet of things, cloud computation, sensors, microcontrollers, and real-time monitoring are the core of smart city approaches (Cocchia, 2014). In this roundtable we explore whether the smart city approach can advance discourses of social and environmental justice. The reason we focus on justice here is the fact that such initiatives are being introduced by the ICT (Information Communications Technology) industry where justice is not the main objective (Bronstein, 2009). We will discuss whether the beneficiaries of such investments can be low income and vulnerable groups or are exclusively the capitalist entities.

Planners need to study these trends to be aware of how they change concepts of data, analysis, and more fundamentally space. Given the lack of critical and theoretical approaches for scrutinizing the functions of smart city technologies in urban contexts, there is a need to theorize their ontological and epistemological bases (Goldsmith & Crawford, 2014). Such theories, then, can guide us in understanding how industries and markets use such technologies in urban contexts. This needs a critical approach that scrutinizes the functions and consequences of the use of smart city technologies.

Cities may benefit from all the data and insight provided by this transformation only if there is a reasonable balance in costs and benefits. The data produced and collected by such technologies transforms our understandings of environment, climate, ecosystems, and human activities. Nevertheless, we need to re-assess the directions that seem to be suggested by smart city approaches. One of the main concerns of planning theory is social and environmental justice. With a critical approach, planning theory needs to lead the conversation incorporating justice into the smart city framework. Furthermore, planning theory can identify and prioritize justice issues that might benefit from high spatial and temporal resolution data and analysis.

In this panel we are going to address the following questions:

1. What are the ethical challenges for planners and planning institutions in adopting such technologies and tools?
2. Could “smart city” technologies be a significant tool for pursuing social justice? How?
3. Smart city technologies can help us to measure climate-related variables such as temperature, air quality, etc. How can planners adopt these tools systematically?
4. As the capitalist system is promoting such technologies for generating capital that transforms space, how can planners manage the inherent conflict with equity that this creates?
5. How can smart technologies be regulated to prevent them from undermining central planning goals such as sustainability and justice?

6. How should we change the planning pedagogy and research to manage unjust consequences of such initiatives?

ROUNDTABLE: EXPERIMENTAL METHODS IN URBAN PLANNING - LESSONS FROM THE FIELD AND THE LABORATORY

Abstract ID: 539

Roundtable

RALPH, Kelcie [Rutgers, The State University of New Jersey] kelcie.ralph@ejb.rutgers.edu, moderator
MONKKONEN, Paavo [University of California Los Angeles]
BOARNET, Marlon [University of Southern California] boarnet@price.usc.edu
HONEY-ROSES, Jordi [University of British Columbia] jhoney@mail.ubc.ca
ADKINS, Arlie [The University of Arizona] arlieadkins@email.arizona.edu

As urban planning scholars, we often find ourselves asking causal questions. If we build a new transit line, will people use it? If we change zoning regulations, will housing become less expensive? Frustratingly, our quest for answers to causal questions are often thwarted by a reliance on cross-sectional data or self-selection. Experiments offer a tantalizingly straightforward approach for establishing causality and, over the past 15 years or so, experimenters have left the confines of the laboratory and entered the field (Gerber and Green 2012). Examples of field experiments in urban planning include ambitious, federally-sponsored projects like the Moving to Opportunity program and smaller-scale projects such as an examination of implicit racial bias towards pedestrians at crosswalks (Goddard, Kahn et al. 2015).

This roundtable brings together five scholars with experience conducting experiments in the field or the laboratory. Rather than focus on their findings, the panelists will reflect on the process of conducting experiments. With the benefit of hindsight, what do the experimenters wish that they had known at the outset? What unexpected challenges did the researchers encounter and how did they address them? When it comes to collaborating with outside agencies or gaining the approval of campus ethics committees, what do the seasoned experimenters recommend? In short, what should the novice experimenter know before embarking on a project?

Our aim is to foster a lively, participatory session. To that end, we hope that members of the audience will contribute to the group discussion with their own reflections on the experimental process.

The aims of this roundtable are three-fold: 1) to familiarize participants with the opportunities and challenges of conducting field experiments in Urban Planning; 2) to demystify the research experience through reflection; and finally 3) to inspire participants to develop field experiments of their own.

ROUNDTABLE: TECHNOLOGY REVOLUTION AND THE NETWORK OF SPACES

Abstract ID: 718

Roundtable

PARK, JiYoung [University at Buffalo, The State University of New York] jp292@buffalo.edu, moderator
 KIM, Dohyung [California State Polytechnic University, Pomona] dohyungkim@cpp.edu
 KIM, Yuseung [University of Southern Maine] superplanner@gmail.com

This forum intends to address how new technologies associated with, so called, the fourth industrial revolution affect individual locational choice, and hence, how spatial network would change in the future. Historically, technological innovations have promoted urban sprawl while they began the birth of urban area. The new, hyper-connected network would fundamentally alter our lifeway including our jobs and living spaces (Klaus Schwab, 2016). While it is highly difficult to expect the degree, scope and scale that the technical revolution would transform, we are already experiencing, at least, new technologies in numerous fields. Without proper responses to the revolution, people would fail to be involved or adapt to the new civil society that connects our spaces by artificial intelligence, robotics, Internet of Things (IoT), autonomous vehicles (AVs), 3D-printing, nano- and bio-technologies, quantum computing technologies and so on. So far, most discussions on this new technological revolution have been focused on the nature of technological innovations, missing to explain to what degree and how the revolution would affect our lives in terms of land use including housing and job locations. If we experience the new change and our location choice is affected, we should consider sequential changes in commuting, public transportation, and many urban environments, and eventually, the form of both urban and non-urban areas. For example, the Korean regional development strategy that has centered massive resources on a particular region has led it grow and become a big city, inducing large migration of the rural population to urban cities. Experiencing hollow villages due to the out-migration of the rural population, at the same time, the aging of the rural areas and the lack of basic infrastructure facilities have been threatening the existence of rural areas. The technological revolution may alternatively reverse this experience, revitalizing rural areas and resolving spatial and regional inequality between urban and rural areas (Castells, 2009). In the perspective of space network, alleviating the disparity of regional utility between urban and rural areas using the new technologies and virtual connections may change spatial inequality (Morgan, 2004). This is possible because IoT, 3D-printing and AV technologies will expand the flow of goods and services, which was mostly constrained and dominated by physical space, to the non-physical space, creating new flow of goods and services; these technologies will generate new utility levels for urban and rural areas. Therefore, this forum provides various discussion topics about the effects of technological revolution on the individual spatial choice, and hence, the current network of space. Especially, the different pattern occupying space due to the hyper-connections can generate a new perspective on spatial justice because it has been mostly constrained in the physical accessibility (Harvey, 1973). This forum can provide an opportunity to prepare the new era of digital transformation for local and central governments as well as other private firms and stakeholders and establish collaborating partnership needed for future regional development strategies.

Autonomous vehicles (AVs), e-commerce and the sharing economy are rapidly changing the land use and transportation patterns within cities. The introduction of autonomous vehicles (AVs) may be on par with the initial introduction of private vehicles a century ago as to their impact on basic urban form and all the related economic, social, and environmental impacts. (Rosenzweig & Bartl 2015) While there has been substantial research regarding the technological aspects of AVs and e-commerce, there has been limited research on the secondary impacts on cities. AVs are projected to lead to significant reductions in parking needs which will then impact land use, street design, and development densities. (Litman 2016, Zhang et al. 2015) E-commerce is changing land use patterns by shifting from brick-and-mortar stores to warehousing and distribution centers. Airbnb is constraining the supply of long-term rentals in some cities. (DiNatale, 2017) These changes in turn will alter land value, residential and commercial location preference, and ultimately overall development form. Ultimately, technological shifts will impact equity, environment, economy and governance within cities.

This panel will feature researchers who are studying the secondary impacts of autonomous vehicles, the sharing economy, and e-commerce. Panelists participated in the inaugural Urbanism Next conference in Portland, OR where the academic, public and private sectors came together to discuss these issues. Panelists will discuss their research in this area, offer examples of working with the private and public sector on these issues, and posit about how planning education will shift in an era of transformative technology. Panelists are engaged in research projects related to autonomous vehicles and city budgets, the equity impacts of the sharing economy, how e-commerce is affecting land use, and how transportation network companies impact transit usage.

INFRASTRUCTURE ALTERNATIVES ANALYSIS WITH AN INTEGRATED LAND USE AND TRANSPORTATION FORECASTING MODEL

Abstract ID: 45

Individual Paper Submission

CLAY, Michael [Brigham Young University] clay@byu.edu, presenting author

Integrated land use and transportation forecasting models offer a great deal of value in the analysis of transportation infrastructure alternatives, transportation policy, land use policy, and expenditures on mass transit. These models can help cities achieve successful, sustainable urban futures that increase the quality of life of residents while assisting local governments in making wise use of government money on infrastructure and transit investment that yield the greatest return on investment. This paper presents the development of the Real Estate Market Model (REMM)—a custom implementation of UrbanSim2—in the Salt Lake City, Utah (USA) metropolitan region. This model development project was a joint effort between the Wasatch Front Regional Council, the Mountainlands Association of Governments, the Utah Department of Transportation, and the Utah Transit Authority. Cube Voyager was used as the travel demand model platform that was integrated with REMM. This paper summarizes the model development process, submodel specification, and two major transportation infrastructure evaluation and selection exercises. These exercises will be presented together with modeled results produced by the integrated model system. These results demonstrate the success of the model development process and the model itself. Research of this kind is valuable to researchers and transportation planning agencies interested in developing and improving integrated land use and transportation modeling as a field of study and as a tool for improved transportation infrastructure selection at the metropolitan planning organization level.

CREEPING OUTSIDE CITY BOUNDARY: SPATIAL ANALYSIS OF REGIONAL VARIATIONS OF NEIGHBORHOOD HARDSHIP AND ITS RELATIONSHIP TO SCHOOL PERFORMANCE IN SUBURBAN NEIGHBORHOODS OF THE BUFFALO METROPOLITAN AREA IN 2015 USING GEOGRAPHICALLY WEIGHTED REGRESSION ANALYSIS

Abstract ID: 77

Individual Paper Submission

SALEH, Ilhamdaniah [University at Buffalo, The State University of New York] ilhamdan@buffalo.edu, presenting author

This paper aims to depict regional variation of suburban neighborhood hardship and relate it to the regional variation of elementary school (ES) performance in suburban neighborhoods of the Buffalo Metropolitan Area (BMA). The context of this paper is suburban neighborhood stratification between inner- and outer-suburban

neighborhoods of the BMA. In the U.S., inner suburban neighborhoods have undergone decline, experienced racial composition shifts, and faced economic adversity in the past years (Hanlon, 2008). The disproportionate racial composition and poverty issues that once were a problem of the inner city have slowly crept outside to its neighboring inner-suburban neighborhoods over the years and potentially become the next urban crisis (Lucy & Phillips, 2000). This increasingly disproportionate percentage of racial minorities and neighborhood hardships have impacted neighborhood school demographics (Tarasawa, 2012) and manifested in the variability of school performance across school districts in urban, suburban, and rural areas (Silverman, 2014). This study is an examination of those phenomena in the context of shrinking and segregated metropolitan area of the BMA.

The two research questions are: 1) is there any significant difference in the mean of the Neighborhood Hardship Index (NHI) between inner- and outer-suburban neighborhoods in the BMA in 2015? 2) is there any regional variation in school performance in relation to the neighborhood and school demographics in suburban neighborhoods of the BMA in 2015?

Neighborhood factors that constituted the neighborhood hardship index included: demographic factors (the percentage of the Black and Hispanic population), economic factors (the percentage of the population in poverty), and housing factors (the percentage of housing ownership, and median housing value). School demographic factors were: the percentage students who are Black and Hispanic; in the Free Lunch Program; and with Limited English Proficiency (LEP). The neighborhood and school factors are predictors of school performance. School performance is measured by the average of grade 3 ELA and Math tests of elementary schools in the academic year of 2015-2016. All data were aggregated at the block-group level.

This research hypothesizes that: 1) there is a significant difference of NHI between inner- and outer-suburban neighborhoods, 2) there is a regional variation of school performance within suburban neighborhoods of the BMA. Data for this study were derived from American Community Survey (ACS) 2015 5-year estimate from the U.S. Census Bureau, School Report Cards (SRCs) for the academic year 2015-2016 from the New York State Education Department (NYSED), and School Attendance Boundary (SAB) map from the National Center for Education Statistics (NCES). Cross-sectional data analysis in 2015 was conducted using descriptive statistics, Ordinary Least Square Regression (OLS), and Geographically Weighted Regression (Fotheringham, Charlton, & Brunson, 2001) using Geographic Information System (GIS) ArcMap 10.3 software.

The findings show a significant difference of NHI between inner- and outer-suburban neighborhoods and regional variation of ES school performance across suburban neighborhoods of the BMA. The value of NHI was spatially distributed with a pattern of regional variation across this study area, clustering in the inner-suburban neighborhoods that border the inner city of Buffalo. The relationship between school performance and its predictors was non-stationary across the BMA, with the coefficient of significant predictors varied across the study area.

This study warrants that there was a discrepancy in the allocation of block groups to a particular SAB as SAB delineation does not always coincide with block-group boundaries. In this study, block-groups with centroids fall within a SAB of a particular school were associated with that school. For further recommendation, as data becomes more available in future years, it will be interesting to study the dynamic process of suburban neighborhood change and linked it with suburban school performance change using longitudinal analyses.

USING CITIZEN-GENERATED CROWDSOURCED DATA TO EVALUATE THE EFFECTIVENESS OF CONSERVATION PLANNING

Abstract ID: 116

Individual Paper Submission

FIGUEROA ALFARO, Richard Wagner [University of Nebraska Lincoln] richardwagner1086@gmail.com, co-author

TANG, Zhenghong [University of Nebraska Lincoln] ztang2@unl.edu, presenting author

Crowdsourcing data can provide valuable information to help conservation planners to understand the nature-human interaction and thus improve our conservation planning decision-making. But Traditional approaches for evaluating the value of ecosystem services rely on surveys or interviews. Social media provides a new type of crowdsourcing data to examine the relationships between aesthetic value of ecosystem services and citizens' activities. The main goal of this paper was to evaluate aesthetic value of ecosystem services by using citizen-reported geo-tagged photographs posted on two social media sites - Panoramio and Flickr. The study used the Application Programming Interface (API) from Panoramio and Flickr to obtain the latitude and longitude of the geo-tagged photographs, and then used ArcGIS spatial statistical tools to examine spatial patterns with areas of aesthetic value in Nebraska. The outcomes identified the clusters of pictures with the locations of ecosystem service provisioning areas of aesthetic value, identified new areas with aesthetic value, and drew comparisons with local and regional population distribution. This study provided an innovative approach to using crowdsourcing data to verify the value of ecosystem services and confirm the effectiveness of conservation planning.

ASPIRATIONS AND REALITIES OF POLYCENTRIC DEVELOPMENT: INSIGHTS FROM MULTI-SOURCE DATA INTO THE EMERGING URBAN FORM OF GREATER SHANGHAI

Abstract ID: 245

Individual Paper Submission

YANG, Tianren [University of Cambridge] tianren.yang@hotmail.com, presenting author

JIN, Ying [University of Cambridge] yj242@cam.ac.uk, co-author

Urban morphology has been extending its cultural, historical and geographical investigations and incorporating economic forces (Moudon, 1997). The physicality of the built environment in turn shapes transactions and flows (Alexander, 1964; Jiang and Ren, 2018). In particular, the polycentric urban form has long been considered a recipe for relieving overcrowding in historic cores and spreading prosperity to peri-urban areas. This polycentric idea has recently been reinvigorated in many rapidly urbanising countries, especially China. Over 130 new municipal level centres (which are known as municipal 'sub-centres') have been promoted in those Chinese cities

with a population over 5 million. However, there has been little official data, let alone assessment on the extent to which the polycentric policies are shaping the cities.

There has been a long tradition in developed countries in examining this question (Alonso, 1970; Arribas-Bel and Schmidt, 2013; UN-Habitat, 2012). Anas et al. (1998) and Fujita and Thisse (2013), among others, have made the case that the fundamental economic drivers of market growth under polycentric development remain a supply-demand relationship in production, residence and land development. Numerous attempts have also been made to trace and predict human choices and property markets using empirical data, statistical models, and computer simulation (Ahlfeldt and Wendland, 2013; Batty, 2013; Kretschmer et al., 2015). Nevertheless, the paucity of data in developing countries has so far made it next to impossible to make progress there.

This paper presents a new method for developing countries with good online publication of land sales transactions and traffic flow speeds to measure the evolution of urban form, particularly polycentricity. The land sales and traffic speeds represent two fundamental market outcomes in a dynamic spatial equilibrium process (Jin et al., 2013). Such data are increasingly made public among large cities as part of the open government initiative (e.g. the land sales) or to improve urban living (e.g. traffic speeds). While it fills important gaps in knowledge and measurement in developing countries, the data sources on their own cannot be directly used for investigating urban form. Our recent work in Chinese cities (Wan et al., 2018; Wan and Jin, 2017) shows that through combining the online sources with other data including transport networks (including online map services), business surveys and company registrations, population and employment censuses and social media presence, it is possible to cross-validate and carry out data infills, and thus make effective use of all the sources in studying land use, built form and travel.

In this paper we use a dynamic spatial equilibrium model we have developed for Greater Shanghai to carry out this data fusion and cross-validation exercise in order to measure the evolution of polycentricity over the last decade. The model can also support regular monitoring of progress going forward. The Greater Shanghai Region includes Shanghai Municipality and its hinterland in Jiangsu and Zhejiang provinces, which has become an amorphous city region thanks to vigorous expansion of infrastructure networks and trade. Shanghai Municipality and adjoining cities have been making persistent investments in creating more than a dozen new subcentres across the city region of more than 30 million people. However, there is currently little evidence available regarding the progress in polycentricity. This paper will present the first measurements for the Greater Shanghai Region, and a method that is cogent to a large number of developing country cities in Asia, Latin America and Africa where there is reasonable access to online data sources.

A LAND-USE AND CAPITAL-INVESTMENT ALLOCATION OPTIMIZATION APPROACH TO FOSTERING COMMUNITY OPPORTUNITY: CASE STUDY OF COLUMBUS, OHIO

Abstract ID: 276

Individual Paper Submission

WANG, Chih-Hao [California State University, Fresno] cwang@csufresno.edu, presenting author

Land-use planning and capital investments have been increasingly recognized as important measures to mitigate or offset social inequality (Wang and Chen, 2017). The socioeconomic outcomes of a residential community, which is defined as community opportunity in this study, are influenced by socially-interactional and institutional mechanisms embedded in a city (Sampson et al, 2002). Particularly, institutional resources and routine activities, often overlooked in the past research, account for the spatial variation in community opportunity of a city (Sampson et al, 2002). Institutional resources refer to the quality, quantity and diversity of capital investments (e.g., schools, libraries, and hospitals), while routine activities measure the types of land uses (e.g., residential, commercial, and industrial units) at the community level (Smith et al, 2000; Sampson et al, 2002). Therefore, community opportunity can be formulated as a function of land uses, capital investments, and socio-demographical characteristics.

Community opportunity index (COI), comprised of a set of physical and socioeconomic factors, has been created to visualize the distribution of community opportunity and vulnerability in American cities (Reece and Gambhir, 2008; Wang and Chen, 2017). The idea is based on the concept of “neighborhood effect”, which originates from a longstanding argument in sociology that where an individual lives could support or hinder the individual’s socioeconomic outcomes (Acevedo-Garcia et al, 2004). Geographical mapping of the computed COI can help address how the neighborhood context influences individuals’ future opportunities in terms of employment, education, health and safety, housing affordability, mobility, and accessibility. Nevertheless, to develop a fair community framework, it is necessary to understand and model the local relationships between community opportunity and the built-environment features of a city, which is shaped by the allocation of land uses, transportation infrastructure, and public facilities.

With this goal in mind, mathematically-explicit local relationships can be estimated by a geographical weighted regression (GWR) model, relating the computed COI to land uses, capital investments, and socio-demographical characteristics. A COI was computed for Columbus, Ohio, using the aggregated scores of a set of socioeconomic factors. A GWR was also estimated, accounting for the local built-environmental effects on community opportunity. The purpose of this study is to embed the statistically-estimated local relationships between inputs and outputs in a land-use and capital-investment mode that would maximize the total community opportunity by an optimal allocation of future land uses and capital investments, or minimize the total difference in community opportunity between a community and one another, subject to future growth targets and land availability constraints. Solving this optimization model for various policy scenarios would provide planning insights into the allocation problems of future land uses and capital investments for developing a fair community framework.

THE FUTURE OF CANADIAN SMART CITIES: EARLY SIGNALS FROM SIDEWALK LABS AND SMART CITY CHALLENGE

Abstract ID: 326

Individual Paper Submission

In the 2017 Federal budget the Government of Canada declared its intent to spark urban innovation with an eleven year, \$300 million investment in the new Smart Cities Challenge (SCC—Government of Canada, 2017). Submissions are due in April 2018 and at least fifty Canadian communities have projects under development. This competition and the Alphabet (Google) Sidewalk Labs investment of \$50 million (USD) in the planning of the Quayside project on Toronto's waterfront are significant and early investments in smart city efforts in Canadian cities. What kind of smart city do the federal government, Canadian municipalities and Alphabet imagine?

By the end of summer 2018, Sidewalk Labs will be half-way through its year-long planning process and the Government of Canada will have selected its short list of cities to proceed toward adjudication of the full funding round. This timeframe presents an opportunity for a critical early check-in on the progress of smart city planning in Canada. In innovation challenges like the federal government's Smart City Challenge, most of the attention will be paid to the winners. However, there is value in examining the wider range of submissions to gain theoretical and practical insight into the full range of smart city activities (Robinson and Gore, 2015).

This paper will respond to the following questions. First, what forms are smart cities taking in Canada? Through an analysis of the first round of submissions to the Smart City Challenge, this paper will map and evaluate the types of smart city projects imagined, the issues Canadian municipal governments hope smart cities will address and the kinds of technologies proposed to be used. Next, what shape is the Alphabet/Google Sidewalk Labs project taking on the Toronto Waterfront? Through an analysis of the substantive elements of the first six months of public consultation process, this paper will begin to frame how the Quayside project is beginning to unfold. And, how does Quayside compare to other Canadian smart city projects? The early discussions about this project position it as groundbreaking and precedent setting. The country-wide Smart City Challenge will provide a series of comparative projects from which to draw comparisons. Project elements for comparison include: vision, goals, types of technology proposed, the extent to which the data will be open or closed for further use, and the role of public and private sector partners

As smart city momentum begins to move from plan to implementation, this early evaluation of proposed Canadian projects is important. Research on smart city implementation is "in its infancy, fragmented along disciplinary lines and often based on single city case studies." (Luque-Ayala & Marvin 2015, 1). Worldwide we are seeing smart cities take myriad forms and Toronto, Canada is home to Sidewalk Lab's first large-scale planning foray. The analysis of these projects will show common threads and proposed innovations across Canadian projects and will allow for exploring points of connection with the broader smart city movement emerging worldwide. This paper will conclude with reflections for planners about what challenges and opportunities these projects present for our practice in North American cities.

UNDERSTANDING SUPER COMMUTERS BEHAVIORS IN THE TEXAS TRIANGLE

Abstract ID: 337

Individual Paper Submission

Unfortunately for many of us, John Maynard Keynes' 1930 prediction that his grandchildren's generation would only work 15 hours a week as a result of continued advances in technology did not come true (Elliot, 2008). Not only has the average American work week stayed at around 35-40 hours a week, but the percentage of workers commuting long distances to get to work has continued to grow. While the national mean travel time to work in 2016 was only 26.1 minutes, an estimated 8.7% of all commuters traveled 60 minutes or more to work and 2.7% of all commuters in the U.S. traveled more than 90 minutes (U.S. Census Bureau, 2016). This is up from 8% and 2.5% of 2010 commuters, respectively. While the overall percentage of long distance commuters among all U.S. commuters is still relatively small, it appears to be on the rise.

In response to this growing trend, travel behavior and transportation researchers are beginning to study the growing trend of "super-commuters", also known as "mega-commuters" (Moss and Qing, 2012; Zhang and Chen, 2011; Rapino and Fields, 2013). This project analyzes the commuting patterns of "super-commuters" in the Texas Triangle mega-region, which is one of the fastest growing areas in the country. We define "Super-commuters" as commuters who typically work within the boundaries of one metropolitan area but live outside of its boundaries, and are defined as traveling either 90 minutes or more and 50 miles or more one-way. Understanding where super-commuters commute to and from can provide insight into housing, job, and transportation issues.

This project uses Census Transportation Planning Products (CTPP) commuter flow data to map the 2010 American Community Survey 5-year estimates for commuter residence and workplace locations. Building upon methods previously established in the relevant literature (Rae, 2015), flow lines are created in ArcMap using the population centroid for each residence (origin) and workplace (destination) census tracts to visualize the number of commuters. In addition, two separate hot spot analyses were conducted, one on all origin points at the county level and the other by all destination points at the county level. For the origin hot spot analysis, eight hot spot counties and five cold spot counties were identified at the 90% confidence level. For the destination hot spot analysis, six hot spot counties and no cold spot counties were identified. All of the hot spot origin and destination counties were either in or bordering the Dallas-Fort Worth-Arlington Metropolitan Statistical Area (MSA).

Knowing where super-commuters are traveling helps in guiding where transit funding should be prioritized and helps define our understanding of the mega-region and MSA boundaries. This research shows that DFW and Houston area have the highest percentage of super commuter travel within the Texas Triangle. The majority of the super-commuters that traveled to these areas lived outside of the MSA boundaries, which may reflect a future expansion of the MSA area. Further, many of them live far from Interstate highways and must rely on state and local roads instead, which may put a significant strain on the transportation infrastructure in the region. We believe that continued study of super-commuting and megaregional travel patterns could help guide processes to integrate transportation planning, funding, and services to better function at the megaregional scale.

NEW GLOBAL HUMAN SETTLEMENT DATA AND ITS APPLICABILITY TO PLANNING RESEARCH

Abstract ID: 357

Individual Paper Submission

DEUSKAR, Chandan [University of Pennsylvania] cdeuskar@upenn.edu, presenting author

The Global Human Settlements (GHS) data set, publicly released in 2016 by the European Commission's Joint Research Center, maps and tabulates the growth of all urban centers across the world between 1975 and 2015, using a standardized definition of 'urban'. The data set includes data on population and built-up area for over 13,000 urban centers, at four different points in time. What are the strengths and weaknesses of this data set, and in what ways can it be useful to urban planners?

So far, global comparison of urban growth has relied mostly on United Nations data derived from national census reports, which vary widely in the definitions they use to define what is 'urban'. In addition, data are typically associated with administrative boundaries, which rarely match urban extents. For these reasons, urban data derived from census records are inconsistent both between and within countries. Other studies have measured urbanization using comparable definitions across countries, but their data have been limited to certain geographic regions, samples of cities, or single time points. Until the release of GHS, no data set allowed a globally comprehensive measurement of changes in consistently-defined urban areas across time.

This paper explains the construction of the GHS data set from a combination of gridded population data and a global built-up area layer derived from remote sensing. It discusses the data set's definition of 'urban centers' (contiguous 1 sq. km. cells with a population density of at least 1,500 inhabitants per sq. km., or a density of built-up land greater than 50% of the cell, such that the total population of the cluster as a whole has a minimum of 50,000 inhabitants). The subsequent section provides a summary of basic global metrics for all urban centers between 1990 and 2015, using a cleaned version of the data set. These metrics include changes in population size and density, analyzed by region, income group, and city size, along with a brief discussion of rank-size distribution for the world as a whole and for four large countries (Brazil, China, India, USA).

This is followed by a discussion of the utility of the GHS data set for urban planners and policymakers. The GHS dataset allows planners and policymakers to compare their urban area or country of interest to a similar group over a 25-year period. This can help identify aspects of the growth of that city that deviate from the norm for a group, and in doing so help the planner understand and respond to changes in the city better. Similarly, a policymaker at the national level can compare the size distribution of urban areas in that country with that of similar countries, which can help formulate national urban policies. The GHS data can also help researchers estimate the impacts of planning interventions, for example by analyzing growth trajectories in cities in which a particular intervention has been implemented, and comparing them statistically against those in which it has not, with appropriate controls. Adding variables from other national or global data sets, e.g. carbon emissions, poverty rates, housing prices, or others, can expand the applicability of the GHS data to research on the impacts of planning.

The paper discusses some limitations of the data set, including potential errors in the population data, and precautions related to assumptions in the definition of 'urban centers'. Despite these limitations and precautions, the paper concludes that, as the first data set to provide a consistently-defined, globally comprehensive, longitudinal database of the population and built-up area of all urban areas, the GHS data set offers many benefits to planners and planning researchers.

 ZENG, Jian [School of Architecture, Tianjin University] shunzi284@126.com, co-author

With the acceleration of the current global urban integration process, the world-wide urban revival has entered a new phase. The emergence of informal urban environments, in particular, has led to the evolution of urban forms more than at any time in history. At the same time, the urban renewal also shows a trend of diversification. There is a direct relationship between urban form and urban vitality. The vitality rejuvenation of informal urban space is an important type of optimization of urban stock space. Under the effect of improving people's livelihood and developing economic dual factors, it has also been increasingly concerned by the government and industry.

In order to create a sustainable block shape to improve the informal urban space, activate the vitality of the city and achieve urban renewal, this article starts from the perspective of factor analysis, integrates fractal theory and spatial syntax, and systematically analyzes the influence of informal urban space. Various factors of morphological evolution and the mechanism of action of various factors. Then, from the perspective of non-formal factors such as political, economic, social, cultural, environmental, locational traffic, administrative boundaries of neighborhoods, neighborhood planning, neighborhood residents, and the attractiveness of neighboring neighborhoods, we will build a space suitable for all informal urban spaces. Morphological evolution model. Taking into account the differences between neighborhoods, the article proposes regional, comprehensive and regular principles for the selection of model parameters. To avoid the subjectivity of the research results, this paper uses statistical quantification methods and elements on the basis of the evolutionary model parameter index system. Cellular automata expresses the analysis results in the form of neural networks, revealing the evolution of the spatial form of informal cities. Then use social network data to analyze urban vitality hotspots, superimpose and analyze the correlation between urban form and urban vitality.

Finally, take Tianjin as an example to clarify the influencing factors of Tianjin's informal urban spatial form, build Tianjin's informal urban spatial morphology evolution model, and use numerical methods to express and analyze results. Aiming at the development needs of typical blocks, a specific update strategy was proposed in order to provide a reference for the organic renewal of similar informal blocks in China. The latest developments in the application of multidimensional data information and related analysis methods can promote the deepening research of urban vitality revival.

USE OF ELECTROENCEPHALOGRAPHY (EEG) FOR THE ANALYSIS OF EMOTIONAL PERCEPTION AND FEAR TO NIGHTSCAPES

Abstract ID: 367

Individual Paper Submission

HAN, Syhan [Virginia Tech] syhan@vt.edu, presenting author

KIM, Mintai [Virginia Tech] mintkim@vt.edu, primary author

As the necessity for safety and aesthetic of nightscape have arisen, the importance of nightscapes (i.e., nighttime landscape) planning has garnered the attention of mainstream consciousness. Research on nightscape has been carried out in various disciplines. However, the preceding studies mostly have focused on a particular structure to conduct a field survey rather than on empirical data. Experimental data of nightscape is significant for human health as excessive lighting can cause fatigue and serious illness. Therefore, it is important to study psychological aspects of the effects of lighting on the human body, such as concentration, nervousness, and fear.

The purpose of this study to validate the relationship between nighttime environments and fear as one of the effective response to nightscape. Furthermore, we verify the EEG method as a tool for landscape evaluation. We use survey methods to capture participants' subjective emotions to help interpret EEG data based on existing research, using Mobile EEGs in a real-world setting. While EEG output provides a real-time psychophysiological measurement of response to changing environments, self-reporting of fear provides a context and understanding of these changes. We examine participants' report levels of fear directly corresponded to the interaction of lighting positions and the presence of specific physical elements in the landscape. The specific landscape elements in this study are buildings, low, free-standing walls, tall and short trees, and shrubs. Additionally, we investigate the effects of the presence of a human figure in a nightscape, because the presence of a stranger in a nighttime landscape is suspected to elicit fear. The landscape elements above could increase or decrease the level of fear.

Based on the purposes as stated above, the following three assumptions examined in this paper: (1) the research subject's EEG responses over nightscape images would differ depending on the types of environmental setting that is depicted; (2) if the other landscape elements are constant, it affects the EEG response and fear experienced by the research subject depending on the presence of an adult figure in the nightscape; and (3) the research subjects' EEG response parameters would correlate with their reported level of fear when viewing the nightscape images.

In order to verify these assumptions, twelve digital photographs were used to conduct surveys at the same time as the EEG experiments. Each set has two photos, one with a person and another one without a person. The six sets of photos go as the following: (1) the first set depicts an enclosed setting close to stairs; (2) the second set depicts an open setting; (3) the third set depicts an enclosed setting surrounded by buildings; (4) the fourth set depicts an enclosed setting surrounded by trees; (5) the fifth set depicts a crooked path setting; and (6) the sixth set depicts an enclosed setting surrounded by architectural features. As research subjects view each image, they were asked to rate the level of fear elicited by the nightscape on a 7-point Likert-type scale (where 1 = very fearful, and 7 = very safe).

While viewing the photos of nightscape, the research subjects experienced varying levels of "excitement," "engagement," and "frustration" (interpreted as proprietary in the EEG software). Our findings indicate the corresponding measures of fear vary according to the environmental settings. Based on our physiological EEG experiment, we provide a new analytic view of the nightscape. The approach we utilized enables a deeper understanding of emotional perception and fear among human subjects by identifying the physical environment which impacts how they experience nightscapes.

"CITIZEN'S AFFECT" ASSESSMENT FOR I-85 BRIDGE COLLAPSE EVENT USING SOCIAL MEDIA MINING

Abstract ID: 375

Individual Paper Submission

DUTT, Florina [Georgia Institute of Technology] florina.design@gmail.com, presenting author
GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@gmail.com, co-author

Increasingly, researchers are using social media posts to cognize emergency events and the impact of these events in the day-to-day activities of people[1][2]. This paper examines the emergency event of the interstate I-85 bridge collapse in Atlanta, Georgia due to a massive fire incident under the bridge, using Twitter data. The study outlines how the bridge collapse event altered the traffic incidents and commutes of people in Atlanta as well as its adjacent areas (within 200 miles radius). The research advances the urban-event analysis method using historical, non-geocoded Tweets. A semi-supervised statistical modeling[3] technique is applied for social media opinion mining, to inform key-decision makers in the city. The aim is to equip the key city agencies to handle emergency events in the future with prowess. The research focuses on historical Tweet classification and sentiment analysis method to mine citizen's opinion from large-scale social media data (1.2 million Tweets). Further, the study explains time-series analysis of tweets to explore 'citizen's affect'[4].

The findings of the paper show traffic in Atlanta, as well as traffic in areas outside the Atlanta metropolitan area, experienced disruption during I-85 bridge collapse. The disruption is measured by adverse traffic incidents such as accidents, car crashes, fire, and congestion-related Tweets. Results of Tweet analysis before, during, and after the incident on an hourly basis, show a significant increase in urban-congestion related stress in the study areas during the period of I-85 collapse. The findings emphasize the necessity of alternative infrastructure to efficiently reroute traffic in Atlanta and its adjacent areas when the major interstate is dysfunctional in an emergency event. The analysis also captures people's perception and preference for mode choices during the incident. Analysis showed that people appreciated the presence of MARTA's (Atlanta's public Transit) subway system and other alternate modes such as biking. Several Tweets indicate that people took Marta to commute who otherwise would have driven to their destinations. Although specificities in commute route of users cannot be gauged solely through Tweeter data analysis, the pattern of increased traffic incidents reported on interstates I-20 or I-65 during the time of the event is discovered. Identification of such patterns is the stepping-stone for further investigation of the causality.

The use case highlighted explains techniques of retrieving and analyzing social media data such that it is useful for key decision makers and stakeholders. The findings of the research aim to prepare the city agencies to combat future emergency events [5]. There can be other use cases of the same system. For example, in a natural calamity like, hurricane, the method of historical Tweet mining could be used by the local planning agencies to understand what worked and what did not, when remedy efforts are being implemented.

LEVERAGING MACHINE LEARNING AND TWITTER, TO IDENTIFY RESCUE NEEDS DURING HURRICANE HARVEY

Abstract ID: 429

Individual Paper Submission

MOBLEY, William [Texas A&M Galveston] wmobley@tamu.edu, presenting author
SEBASTIAN, Antonia [Rice University] ags3@rice.edu, co-author

The timely understanding of flood extent is critical information for emergency managers during disaster response. Search and rescue operations require a boundary to reduce fruitless efforts and to prioritize critical or limited resources. However, high-resolution aerial imagery is often unavailable or lacks the necessary geographic extent, making it difficult to obtain a real-time information on where flooding is occurring. Volunteered geographic information (VGI) is a subset of crowdsourcing and can be used to disseminate spatially relevant information or request help (Goodchild and Glennon, 2010). VGI allows for real-time updates during a hazard event and can provide a rapid understanding of the spatial implications of the event. In this paper, we present a novel approach to map the extent of urban flooding in Harris County, TX during Hurricane Harvey (August 25-31, 2017) and identify where people were most likely to need immediate emergency assistance based on a subset of SOS requests. Using the machine learning software Maximum Entropy (MaxEnt), we predict the spatial extent of flooding based on several physical and socio-economic characteristics coupled with crowdsourced data. We compare the results against two alternative flood datasets available after Hurricane Harvey (i.e., Copernicus satellite imagery and fluvial flood depths estimated by FEMA), and we validate the performance of the model using a 15% subset of the rescue requests, Houston 311 flood calls, and inundated roadways. We find that the model predicts a much larger area of flooding than was shown by either Copernicus or FEMA when compared against the locations of rescue requests, and that it performs well using both a subset of rescue requests (AUC 0.917) and 311 calls (AUC 0.929) but is less sensitive for inundated roads (AUC 0.721). This study is an initial proof of concept for using machine learning as a real-time regional scale flood warning system. This approach overcomes the limitations of conventional approaches to disaster management. Implementation of this application has the potential to identify areas in need of rescues with as few as five calls (Hernandez et al., 2006).

NEIGHBORHOOD CHARACTERISTICS AND ACTIVITY SPACE: A NEW APPLICATION OF SOCIAL MEDIA DATA

Abstract ID: 431

Individual Paper Submission

HU, Lingqian [University of Wisconsin-Milwaukee] hul@uwm.edu, presenting author
YE, Xinyue [Kent State University] xye5@kent.edu, co-author
LI, Zhenlong [University of South Carolina] ZHENLONG@mailbox.sc.edu, co-author

This research investigates how socioeconomic and spatial characteristics of neighborhoods affect residents' activities spaces, which are defined by using social media data. The research is at the intersection of two fast-evolving research fields: one is the application of big data and the other one is spatial equity. On the one hand, information from big data can be used to build smart and connected communities (Sun et al. 2016), but little research has investigated how big data can be used to understand and address inequality. On the other hand, the spatial inequality in activity spaces has gained increasing interests. Activity spaces are defined as where people conduct daily activities and interact with others outside home (Horton and Reynolds 1971). Existing activity space research tends to rely on travel diary data (Farber et al. 2015) and activity diary surveys (Jones and Pebley 2014, Wang and Li 2016), which generally have small sample sizes. Big data could better reflect the population than conventional survey data.

The research contributes to the literature in two ways: First, we explore the applicability of using social media data to describe activity spaces. Second, we examine the neighborhood-level determinants of activity space. The research can enrich the growing empirical literature on activity spaces and provide a proof of concept that big data can be used to investigate spatial inequality.

The study area is the Los Angeles metropolitan area, which is chosen because of its fragmented urban spaces and demographic diversity. The two characteristics combined allow heterogeneous activity spaces across space and across population groups. The Census tracts are the spatial unit of analysis.

We rely on 2015 Twitter data to describe activity spaces. After the data processing and cleaning, 87,063 unique users with valid geo-information are selected. To describe activity space, we first define the home census tract of a Twitter user as the tract where the user sent most tweets during the night time (9pm-5am) in the study period. We then estimate the activity spaces of all Twitter users residing in the same home census tract. We adopt two quantitative measures of activity spaces—1. the average distance between the home tract and the locations where the Twitter users tweeted out of the home tract; 2. the average spatial area formed by the location of the tweets from all Twitter users residing in the home tract.

To answer our research question how neighborhood characteristics affect activity spaces, we apply ordinary least squares (OLS) regressions. The two activity space measures are the dependent variables. The independent variables include socioeconomic characteristics (i.e. race/ethnicity, education, poverty level, employment status, and vehicle ownership) and spatial characteristics (i.e. the distance to the Central Business District, population density, and activity density). Data of neighborhood characteristics come from the 2011-2015 American Community Survey (ACS) and the 2015 Longitudinal Employer-Household Dynamics (LEHD).

Preliminary results suggest that in the study area, spatial disadvantages of minorities with respect to their activity spaces are apparent: the share of racial/ethnic minorities is negatively associated with the size of activity spaces. Spatial characteristics have expected effects: Higher density is associated with smaller activity spaces, and the census tracts that are farther away from the CBD have a longer average distance to activities.

In recent decades, the increase in extreme heat events has decreased human thermal comfort levels. In particular, densely built areas are disproportionately affected by heat waves because of the urban heat island (UHI) effect, the phenomenon by which urban areas are warmer than surrounding rural areas (Oke, 1981). Several strategies have been developed to mitigate the UHI, such as installing green roofs and planting trees (Raji, et al. 2015). However, there is still much debate surrounding the type of temperature, land surface temperature (LST) or air temperature (AT), to investigate the UHI (Schwarz, et al., 2012). A lack of understanding the basic interaction between LST and AT is a critical barrier to the decision-making process in urban heat management. Research has yet to investigate how urban characteristics influence the levels of both LST and AT in UHI formation. Therefore, we explore the contribution of urban characteristics to affecting both LST and AT and the spatial relationship between these temperature measures in the city of Houston.

Houston's rapid development challenges an already dwindling urban canopy, potentially resulting in more intense UHIs in the inner city. The imbalance between the built and natural environments exposes more of the populace to extreme temperatures and increases the number of heat-related illnesses, particularly in those populations who are considered most vulnerable to high temperatures. This study accounts for the two- and three- dimensional urban determinants of LST and AT, using diverse geospatial data obtained by passive and active optical remote sensing technology, such as Moderate Resolution Imaging Spectroradiometer (MODIS), Color Infrared aerial photos (CIR), and Light Detection and Ranging (LiDAR). Our approach consists of (a) observing land surface temperatures and air temperatures, (b) analyzing the spatial patterns of these temperature measures, (c) extracting physical urban characteristics, (d) investigating impacts of these characteristics on UHIs, and (e) recommending policies to properly reduce UHIs derived by LST and AT.

This study will provide an applicable foundation for addressing Houston's energy demand and heat-related health concerns. These findings can guide development of sustainable solutions that can be implemented as a formal part of urban design, thereby contributing to the health and welfare of the general public and its environs.

A HYBRID LAND-USE CHANGE MODEL WITH AUTOMATED LAND PARTITIONING AND CONSOLIDATION

Abstract ID: 527

Individual Paper Submission

TEPE, Emre [Gebze Technical University] emretepe@gtu.edu.tr, presenting author

Modeling land-use changes is a difficult task due to challenges in methodology and computation. Different approaches for modeling land-use changes at various geographical scales have been proposed over the last two decades by a diverse group of researchers. There are mainly two different approaches: (1) statistical methods used to discover transition rules, and (2) simulation-based methods predicting future land-use changes based on predefined transition rules. There is no doubt that finding the actual transition rules is the main goal. Therefore, statistical methods offer better performances in terms of obtaining robust land-use change models. However, such a robust land-use change model requires a high level of complexity that brings methodological and computational challenges.

Dynamic land-use change models incorporating spatial and temporal land dynamics are required to obtain robust transition rules. Ferdous and Bhat (2013) introduce a spatial panel ordered-response probit model that incorporates both spatial interactions and temporal dynamics. Wang et al. (2012) present a multinomial probit model that incorporates spatial and temporal dependencies to investigate parcel-level land-use changes in Austin over 8 years (2000-2007). Although these studies introduce new methodologies for dynamic land-use change modeling, they recognize the computational infeasibility of considering spatial dependencies across all parcels. Small geographical scales, such as the parcel, can provide a wealth of information due to spatial heterogeneity, but such data increases the number of observations in the dataset. Tepe and Guldman (2017) adapt the Spatio-Temporal Autologistic Regression Model (STARM) to estimate the probability of a parcel changing its status from vacant to developed, using a large dataset related to 70,000+ parcels.

Parcel-level dynamic models incorporating spatial and temporal dependencies are based on the assumption of parcels with fixed shapes and boundaries over time. However, land partitioning and consolidation also play an important role in land dynamics (Demetriou et al., 2013). Both land development and partitioning/consolidation can be viewed as closely-linked decisions. Simulation-based modeling approaches can be used to expand the dynamic land-use change models by incorporating land partitioning/consolidation. Alternative approaches can also be considered, such as cellular automata simulation models combined with automated land partitioning algorithms, as proposed by Yao et.al (2017).

In this study, a hybrid land-use model is formulated, integrating a vector-based cellular automata model with an automated multi-objective optimization land partitioning and consolidation algorithm, where STARM is used for transition rules. The proposed model framework is tested on land development in Washington D.C. The dataset contains detailed information over several years about each parcel and building in Washington D.C., such as size, land-use, and construction date, and historical records of land subdivisions are also available. Preliminary results point to a promising advance in land-use change modeling. Accurate land-use change models can be used for predicting future land-use changes and testing the effects of proposed plans and policies, particularly in the context of climate change and environmental protection.

USING MULTI-SENSORY IMMERSIVE VIRTUAL REALITY IN PARTICIPATORY PLANNING

Abstract ID: 604

Individual Paper Submission

MEENAR, Mahbubur [Rowan University] meenar@rowan.edu, presenting author

In recent decades, a range of planning practices has embraced digital technologies to enhance traditional public participation processes and to support different forms of e-governments (Mandarano, Meenar, & Steins, 2010). The use of "participatory" geographic information systems (GIS) in measuring multidimensional socioeconomic problems—tied to the built environment—may produce more comprehensive results compared to other commonly used methods (Meenar, 2007). Smarter instruments, such as the immersive virtual reality (IVR), can simulate social interactions and complex environments. Modern multisensory IVR technologies can better predict the impact of future scenarios on communities and their complex environment, and can enhance the participatory planning process. A few researchers are incorporating complex multisensory variables of the environment, such as acoustic and visual parameters, to enhance the IVR technology (Maffei et al., 2016; Ruotolo et al., 2012). Smell is one of the most primal and influential forms of environmental sensing, but it has remained an underdeveloped dimension of how we experience and design urban environments because of the complexity of our olfactory system and difficulty in quantifying and capturing scents (Henshaw, 2013). Recently, however, a growing demand to understand the social and spatial role of olfaction in urban environments has emerged out of a broader movement to design sustainable cities for the full human sensorium. The influential, yet understudied, dimension of olfaction in human decision-making can be relevant to the community planning process. It remains to be seen whether multisensory IVR experience could benefit from olfactory cues.

This paper is based on a research study with the following questions: Does IVR technology coupled with multisensorial parameters (i) increase the level of public participation and (ii) promote a better understanding of a simulated urban environment? Does this technology have an advantage over other commonly used methods and tools used in the participatory planning process? Can we measure these benefits?

The project team formed four focus groups—with 10 participants in each group—exploring future development scenarios of a proposed Arts and Entertainment District in Glassboro, New Jersey. Group 1 experimented with 3D GIS visualization outputs without any IVR technology, Group 2 experimented with IVR technology, Group 3 experimented with IVR technology—coupled with sensorial experiences such as sound and smell, and Group 4 was the control group, which experimented with all of the above. The qualitative analysis and discussions of this paper are based on pre- and post-event survey results and focus group conversations.

This paper concludes that innovative combinations of participatory planning tools, IVR, and geospatial technologies can play an effective role in a community decision-making exercise. It expands our understanding of the effective engagement of community residents and stakeholders in spatial planning process.

Objective—This paper presents a GPS-defined measure of activity space that captures changes in exposure as participants move through their environments.

Background—Global Position System (GPS) technology allows researchers to study environmental exposures at a level of scale and detail never before possible. The challenge has been to create measures that capture the richness of GPS data. Many studies use Hagerstrom's concept of the activity space as a starting point for this work. However, often the methods used to construct the activity space from GPS data do not lend themselves to the measurement of exposure.

Previous research has found a connection between residential property values and health. Moudon et al (2011) distinguished between personal wealth (the property value on participants' home parcels) and neighborhood wealth (the average property value of all residential parcels within 833 meters, about a ten-minute walk, of participants' home parcels) and found both were significantly associated with self-reported health. We build on of this research by introducing exposed wealth, a measure of the average residential property values of participants' GPS-defined daily activity spaces.

The relationship between socioeconomic status and obesity has been widely recorded and a steadily increasing body of literature is demonstrating that residents of high-SES neighborhoods have lower obesity rates than residents of low-SES neighborhoods. We use exposed wealth as a measure of the SES of the activity space experienced by individuals as they perform their daily activities. As such, exposed wealth may represent a social contagion effect on obesity—similar to that identified by Christakis and Fowler (2007)—in which exposed wealth serves as a proxy measure of contact between individuals of differing SES and obesity statuses.

Methods—Data for this study came from the Seattle Obesity Study II (SOS2). An NIH-funded research project comprising a sample 390 residents living within the urban growth boundary of King County, Washington. Recruited using an address-based sampling method, participants wore GPS receivers that recorded their locations at intervals of 30 seconds over 7 consecutive days and completed a computer-assisted questionnaire. Using GIS, parcel-level residential property values (land + improvements) from King County tax assessor data were smoothed into a continuous surface of 30-by-30-foot cells, each measuring the mean residential property value per unit within 833m of cell centroids. For each participant, the property value of the location of each GPS record was then obtained. Three measures of wealth exposure were then created. Exposed wealth was created by averaging the GPS-obtained property values over the course of a day and then averaging across days. Exposed difference was the participant exposed wealth minus home neighborhood wealth, the property value per residential unit within 833m of participants' homes. The percentage of time spent in areas with the population above-median exposed wealth values was also calculated.

Results—We found that being white, college-educated, living in a household with < 2 cars, and being non-obese were associated significantly higher mean exposed wealth values. Exposed wealth was associated with a decreased odds of being obese (OR=0.62, 95%CI 0.39–1, p=0.046) after controlling for neighborhood wealth, SES, and demographics. Neither percent of time nor exposed difference were significantly associated with the odds of being obese after controlling for SES and demographics.

Conclusions—This paper attempts to demonstrate the potential for future research in linking activity space to built environment exposures using the methods used to measure of exposed wealth. Though our results were mixed, we

believe this method may be very useful in capturing changes in exposure to other built environment characteristics such as density, green infrastructure, or proximity to specific land uses.

NEL, Darren [The Hong Kong Polytechnic University] darren.nel@connect.polyu.hk, co-author

BRUYNS, Gerhard [The Hong Kong Polytechnic University] gerhard.bruyns@polyu.edu.hk, co-author

Traditional urban economic models of the city postulate that the price and development intensity of land is a function of its accessibility (Alonso, 1964; Mills, 1972; Muth, 1969). In the field of economic and transportation geography, the concept of accessibility can be defined as the ease with which one can travel between origins and destinations of value (Páez, Scott, & Morency, 2012). With finite amounts of land, transportation infrastructure, and opportunities for interaction within a city, locations that are more accessible should command higher economic rent and greater development densities, all else being equal.

More often than not, such research has found a positive association between accessibility and land prices, for example around rapid transit stations (Higgins & Kanaroglou, 2016). However, in practice, this concept of accessibility and its link to urban form outcomes is often operationalized in two dimensions, with existing approaches derived from, and most suitable for analyzing low- to medium-density cities.

In contrast, higher-density “volumetric” cities require new methods and techniques for estimating accessibility and its link to urban form. Per Shelton et al. (2011), volumetric cities feature multiple modes of movement and stacked layers of activities above and below ground with particular emphasis on pedestrian networks. Moreover, topographical variation in these layers of activities and their relationship with the ground presents additional complexity when considering pedestrian connectivity and the ease of movement. Quite simply, existing approaches to measuring access are not appropriate for capturing the dynamics of high-density, volumetric, and topographically-varied cities.

In response, using a case study of Hong Kong Island, the present paper proposes a new approach to measuring pedestrian accessibility in volumetric cities, and estimates its link to land prices. The methods employed to estimate this relationship include creating a three-dimensional, slope-aware walking environment, and using it to estimate accessibility. Moreover, spatio-temporal hedonic regressions are utilized to estimate the link between accessibility and property prices. Preliminary results suggest that topography and layered connections have a significant impact on walkability and access. Furthermore, econometric models suggest a link between

connectivity and willingness to pay among households.

UNDERSTANDING PATTERNS OF TOPICS AND TRENDS IN URBAN PLANNING: A TEXT-MINING APPROACH TO ANALYZING INTERVIEWS OF U.S. PLANNING SCHOLARS BETWEEN 2001 AND 2017

Abstract ID: 631

Individual Paper Submission

KIM, Keuntae [University of Utah] kimprins@hotmail.com, presenting author

KIM, Ja Young [University of Utah] , co-author

As a basic communication tool, texts in urban planning reflect not only the way planners think about urban planning but also its challenges in the future. Since the 21st century, advanced information and data management technologies allow planners to produce a large number of texts about a variety of planning topics and accumulate them as a potential data source for examining dynamics of planning topics and trends. In the recent literature, a few studies collected texts from social media to understand public feedback related to planning issues (Evans-Cowley and Griffin 2010; Schweitzer 2014) or used keywords of journal articles to identify a change in planning trends (Gobster 2014). These studies suggest that use of texts as a data source and its quantitative approach can be applied to other forms of planning document texts.

As a pilot study on text mining in urban planning, this study focuses on analyzing texts in interviews of U.S. planning scholars and identifying how planning topics or trends have changed since the beginning of the 21st century. To achieve this goal, this study collects texts of U.S. planning scholar interviews conducted by Korea Research Institute for Human Settlement (KRIHS)—a governmental planning research institute in South Korea. Interviews have been conducted to randomly selected planning scholars throughout the world, and interview articles have been published in KRIHS's monthly magazine "Planning and Policy" every month since July 2001. Currently, 192 interviews have been published, and 102 interviews have been implemented to 102 U.S. planning scholars so far. All interview articles of U.S. planning scholars are written in English, and an unstructured interview is applied to get interviewees' responses to various planning topics like a comfortable conversation. Preprocessing of texts is done both automatically and manually to extract frequencies of planning terms. To identify a significant change in planning trends and topics under the U.S. planning contexts, the 102 interviews are divided according to two influential events occurred during the interview period—Great Recession in 2008 and 2010 and recognition of big data as a science in 2008. To understand changes in planning themes, interviews are classified according to interviewees' research interests and subjects of an interview.

Based on preprocessed texts, this study conducts three text mining techniques to identify dynamics of trends in urban planning—exploratory text analysis, topic modeling, and sentiment analysis. In the exploratory text data analysis, word clouds, word frequency graphs, and cluster analysis confirms shifts to data-driven quantitative research and analyses of multidimensional planning phenomena such as urban sprawl, planning equity, sustainable development, and so on. In probabilistic topic modeling, 17 different topics are identified from interview texts, and most of the topics except for two topics related to data-driven assessment systems and prediction modeling are traditional planning topics. Topics on data-driven and evidence-based approaches to multidimensional planning phenomena tend to become evident after Great Recession and emergence of big data. In the sentiment analysis, U.S. planning scholars tend to become more confident in measuring multidimensional

planning phenomena by using microdata and finding solutions through identifying causal paths in planning problems. However, at the same time, these micro-level data modeling and analysis also reveals needs to explore environmental impacts of the built environment on natural disasters and global climate change as well as urban sociological issues such as public safety, equity, the housing crisis, transportation equity, and so on. From these results, this study contributes to expanding the further discussion on changing trends in urban planning by analyzing a large number of texts at a time through an integrated text mining approach.

EXAMINING URBAN SPATIAL FORM THROUGH MICROBLOG HOTSPOTS DISTRIBUTION: A CASE STUDY OF SHANGHAI

Abstract ID: 635

Individual Paper Submission

HAN, Jing [Tongji University] hanjing815@tongji.edu.cn, presenting author

With the rapid development of information technology, the interaction between the virtual world and the real space has become a hot topic in urban planning and architecture field, especially big data mining and applications. Microblogging, a means of broadcasting information about one's activities, opinions, and status, has been embraced worldwide. Since the combination of microblogging and geolocation, geo-tagged microblog has become a valuable source for the study of human dynamics and geography entity. Its analysis is shedding new light not only on understanding human behavior but also on modeling the way people live and interact in their urban environments. From the perspective of microblogging, a very popular social networking media tool, this paper attempts to test the implement effect of the urban planning program and the consistency degree between urban spatial form and microblog hotspots distributions.

Although academic studies published on this topic are increasing, the research is still one cutting-edge topic and in a very early stage. Hughes and Palen (2009) estimate that nearly 70% of public tweets are or could be georeferenced. Some early works have graphed and animated heat map of Twitter, proving Twitter users can be considered citizen-sensor of real-world events (Sakaki, Okazaki and Matsuo 2010). Beyond events reacting, several studies investigated characteristic patterns in urban areas such as populated areas from the movement histories of mass mobile micro-bloggers (Nagarajan et al. 2009; Ruiz and Hristidis 2013). One initial qualitative study efforts by Martinez et al. (2012) develop technique to automatically determine land uses in a specific urban area based on tweeting patterns, and to identify urban points of interest as places with high activity of tweets. However, we still lack an in-depth understanding about the sociological meanings of microblog distribution and the helps to urban planning.

Specifically, this article tries to study and answer the following questions: Where people microblog? How microblog hotspots move as time goes on? What spatial features the hotspots have? Whether the hotspots distribution corresponds with the urban spatial form brought about by the city planning program? How to explain this phenomenon?

To this end, this paper takes SINA Weibo (China's most popular microblog tool) as research platform and takes Shanghai central city region as research area, carrying out the study by five steps: (1) collecting, cleaning and visualizing the original microblog data; (2) distinguishing microblog hotspots spatial distribution pattern; (3) drawing and analyzing microblog heat maps; (4) typing microblog hotspots by urban functions; (5) comparing and verifying the interrelation between microblog hotspots distributions and urban spatial form.

By analyzing mass geo-tagged and time-stamped microblogs, we can find when and where micro-bloggers like staying, what characteristics these places have, what real urban spatial form produced by people's daily activities looks like and what differences between it and the early planning programs.

The results show that: (1) the microblog distribution in macro space dimension coincides with urban structure (including commercial center distribution, population density distribution and rail transit networks); (2) most microblog hotspots cluster at circles with the radius of 4 km and 9 km away from the city center, where commercial complex, universities and techno park are located; (3) the spatial-temporal movement of microblog hotspots brings out the residential communities, offices, universities and industrial parks, complementally proving that microblog distribution in the macro space diminution is urban-function-related.

Through visual analyzing microblog spatio-temporal distribution in the urban space, this paper studies the living-working location features and social attributes of microbloggers, who represent the most active, expressive and innovative groups. The outcomes provides a useful reference basis for understanding urban spatial form, reviewing and rethinking urban planning program and implementation.

INCLUSIVE RESILIENCE PLANNING: THE CASE OF JAKARTA RIVER FLOODING

Abstract ID: 651

Individual Paper Submission

CHANDRA PUTRA, Handi [The University of Tarumanegara] handichan@gmail.com, presenting author

Urbanization and climate change are two global trends facing our cities. Cities grow through the collaboration that has been built through businesses and real estate. This process cannot be separated from globalization, the flows of finance and trade, and the patterns of production and consumption. The accelerating growth in economies is, however, at the expense of other important aspects of a community such as the equity and environmental aspects (Campbell, 1992a, 1996).

Cities become home to many small and large communities. Some are resilient to disturbances such as climate change, economic crises or social/political unrest, but others are not. City resilience relies on the plans, policies, and institutional arrangement that incorporate more adaptive components (Holling, 1973; Berkes and Folke, 1998; Berkes et.al, 2003). Resilience does not describe ecology and socio-economy of a city as two separate systems. It reflects the efforts of all stakeholders to produce immediate action as well as a long-term solution, in response to the disturbances. Rural migrants, especially those who squatting, are often overlooked in the process. They are not

immune to the disturbances, such as climate change impact of flooding, but most vulnerable amongst all. Moreover, the scarcity of urban space in cities is one of the many reasons for the migrants to locate their settlements informally. Consequently, they are often excluded from the city's formal real property markets and are overlooked by the city's improvement programs (Douglass and Jones, 2008).

This explains why urban squatters have more experience with flooding given the risk is known. The squatters, whom the city considers participating in the informal economies, organize among themselves to reduce flood-risks rather than instead of relying on support from the city government. How they adapt to flooding and how their adaptive behaviors differ from any other urban residents become the main interest of this study (Adger 2010; Leichenko, 2011).

By looking at the case study of Jakarta, this study examines the communities' adaptive behaviors towards climate change phenomena, river flooding, and interaction with other stakeholders, such as local leaders and the city government. Located adjacent to Java sea, Jakarta is particularly vulnerable to flood risk. To understand the dynamics of both informal and formal housings, this study also explores the historical trend of housing formation and flood adaptation. Thus, the study is embedded in the following two research hypotheses. The first is the smallholders often do not have a choice to locate their homes away from flood risk. The increasingly high rent in Jakarta has forced them to locate their homes in the most vulnerable regions of the city. They are often willing to pay the damage costs resulted from flooding. Secondly, community-wide risk reduction efforts are more prevalent among smallholders rather than those in formal housing. Smallholder communities rely on their communities in reducing flood risks while communities in formal housing enjoy the luxury of public infrastructure and services provided by developers and the city government.

My research analysis, by using grounded research and an agent-based modeling techniques, finds that the same income growth rate for both communities of formal and informal housing increase the rate of upward mobility of residents in looking for future housing. In terms of adaptation strategies, the findings suggest a more community effort and evacuation among the slum communities are more prevalent than the rest of urban residents during flooding. The squatters also tend to not return to their original location after the flood damaged or destroyed their homes.

USING BIG DATA AND MACHINE LEARNING TO UNDERSTAND NEIGHBORHOOD DYNAMICS

Abstract ID: 663

Individual Paper Submission

FREEMAN, Lance [Columbia University] lf182@columbia.edu, presenting author

KONTOKOSTA, Constantine [New York University] ckontokosta@nyu.edu, co-author

Planners need for accurate, timely and reliable data on neighborhood conditions. For many years, the decennial census was the only easily accessible data at the neighborhood level that met these standards. Being released only once every 10 years, however, limited the usefulness of census data in terms of timeliness. Also, at smaller

geographies, such as the census block, sampling methods create substantial margin of errors in the estimates, further constraining its usefulness at small areal units. Beginning in the early 2000s, increasing amounts data from nontraditional sources have become available at the neighborhood level. Moreover, the Census Bureau began releasing the American Community Survey, which is updated on an annual basis. Through open data initiatives, municipalities started making data related to city services (e.g. property sales, crime locations, etc.) accessible publicly and on a regular basis. In what might be considered a third wave of data accessibility, spawned by the rise of big data, the ubiquity of smart phones, and the popularity of social media, new types of data with the potential to help us understand neighborhood level conditions and trends are increasingly becoming available. Scholars have used social media to study sentiment towards public transit (Schweitzer 2014), online listings to analyze rental housing market dynamics (Boeing and Waddell 2017), Wifi connection data to measure real-time populations (Kontokosta and Johnson 2017), 311 data to estimate socioeconomic characteristics of place (Wang et al. 2017), and twitter to examine traffic incidents (Gu, Qian, and Chen 2016). These studies suggest the new types of data in the form of social media and/or big data have utility for planning purposes.

For the practitioner with need for data at the neighborhood level, however, it is not clear what types of data might provide the most useful information to understand neighborhood dynamics. The urban planning community has yet to systematically explore the potential for these new sources of data to help us understand neighborhood level conditions. This paper is an early attempt to document these novel data sources and describe how they might be used by local residents, community development practitioners and urban planners.

In this paper, we survey some of these novel sources of data – including social media, smart phone locational data, credit card transactions, city records, and Wifi data - that appear most promising for documenting neighborhood level conditions with a focus on the data's practical utility in terms of accessibility, accuracy and reliability. We also present results from a pilot study utilizing geotagged data from Twitter and sentiment analysis as a measure of neighborhood change, and comparing and validating our results with data from the American Community Survey .

The results of this paper will be of interest to planning academicians and practitioners who rely on neighborhood level data in their work.

Abstract: this article aims to establish the evaluation index system and evaluation model of coastal cities' resilience mitigation abilities based on adaptation—vulnerability. Based on taking Tianjin, Chinese coastal city, as example, unit as the spatial unit, and the adaptation of disaster inducing environment and vulnerability of hazard-affected body as criterion layer, 24 indexes are proposed and the score of Tianjin's resilience mitigation ability is obtained via principal component analysis. Besides, cluster analysis, space autocorrelation analysis, LISA agglomeration analysis and hotspot analysis etc. are applied to know the spatial distribution of resilience mitigation ability and its correlation with spatial unit, which are verified by Geoda. The analysis results indicate that there is no regularity in the spatial distribution of resilience mitigation ability in downtown Tianjin, and it is not closely related to the core area layout structure of Tianjin's overall plan. In specific, no high-adaptation and low-vulnerability area emerged in downtown Tianjin, and as a geometric center with high visitors flow rate and frequent economic activities, the appearance of unstable aggregation with high adaptability and vulnerability appeared Heping District, which means that there is a large room for improvement in Tianjin both in development and resilience mitigation. High-fragility areas are distributed in Heping District, so the implementation of resilience mitigation strategies can properly reduce sensitive populations in exposure to high-risk areas such as heat island, and improve the mitigation standard of older buildings or structures and enhance the resilience mitigation ability of high vulnerability regions by perfecting the green infrastructure within the district. Low-adaptation areas are more concentrated distributed along the outer ring, where the infrastructures are level and the per capita or land assets are relatively less with obvious vulnerabilities in resisting floods and other natural disasters. Besides, medical facilities and other public facilities are relatively insufficient with low density of commercial networks, so there is a clear gap with Heping District in material reserves. By improving the uniform spatial distribution of public facilities, the depth of infrastructure construction and the density of commercial networks with medium and short-term mitigation material reserves can effectively increase the level of resilience mitigation.

SPATIAL MEASUREMENT OF THE ELDERLY'S COMMUNITY LIFE CIRCLE—A CASE STUDY OF YANGPU DISTRICT IN SHANGHAI, CHINA

Abstract ID: 756

Individual Paper Submission

HUANG, Jianzhong [Tongji University] hjz03213@126.com, primary author

ZHANG, Ruiqi [Tongji University] 382713834@qq.com, co-author

HU, Gangyu [Shanghai Tongji Urban Planning and Design Institute] hugangyu1991@163.com, presenting author

Nowadays, the aging of population has become an international issue, and also the fundamental realities of China. Shanghai has entered the “super aging” society since 2016, so the construction of elderly-friendly community and the relevant community planning idea of “life circle” are developing continuously. Under this background, based on individual behavior research method, this paper attempts to conduct visual analysis of the elder's daily travel activities, the result of which lays foundation for the follow-up study of defining the geographical boundary of the elderly's “community life circle” and measuring its spatial characteristics, so as to provide a theoretical basis and

data support for the construction of elderly-friendly community. Both questionnaire survey and GPS data analysis are used in this study, combining subjective and objective research method together. GPS data with daily travel positioning record for 7 days comes from 70 elderly participants from 7 neighborhood committees in Yangpu District of Shanghai. In the first part of the paper, questionnaire and GPS data are linked to analyze the elderly's daily travel behavior. With comprehensive understanding of the temporal and spatial behavior characteristics of the old people, the paper then regards travel mode and spatiotemporal density or frequency as indicators to identify life circle boundaries. At last, we choose walking, biking and highly-frequent bus GPS data to define the elderly's community life circle. On basis of ArcGIS's spatial analysis function, the boundary contour of each committee's "community life circle" is extracted and then overlaid. Meanwhile, the paper tries to establish the spatial system of elderly's community life circle and further measure its spatial characteristics. The result of this study shows that daily travel of the old people is of high frequency and short duration with an average frequency of 4.61 per day and 20 minutes per time. The daily activity space is mainly concentrated in the range of 1000m around the residence. The elderly's community life circle presents a spatial feature of correlation, overlapping and nestification, which could be defined as a two-level spatial system of self-contained circle and sharing circle. Additionally, the scope of the "community life circle" exceeds the administrative divisions, which is actually the true portrayal of the elderly's daily activities in space, and is of greater benefit to the effective allocation of community public facilities and the organization of community activities. Through the bottom-up perspective, this empirical study hopes to extend the applicability of "life circle" theory in the aging background of China through in-depth analysis of individual space-time behavior, and to provide reference for planning, construction and building of the elderly-friendly communities.

EXPLORING DYNAMIC SPATIAL STRUCTURE OF HUMAN MOBILITY WITH CELL PHONE DATA: A CASE STUDY IN SHANGHAI

Abstract ID: 796

Individual Paper Submission

REN, XIYUAN [College of Architecture and Urban Planning, Tongji University, Shanghai ,China]
renxy1994@sina.com, presenting author

With the development of traffic information technology and acceleration of life and work rhythm, in modern metropolises like Shanghai, the high frequency mobility of massive population has caused huge influence on urban internal structure. How to measure human mobility and explain its dynamic structure in the city is of great significance to understand the law of intra-urban population flow. Previous research has mainly focused on human mobility patterns. In this paper, we aim to go one step further from exploring how the whole structure look like when individuals' mobility are aggregated into spatial analysis units using relatively high-precision and large-scale cell phone data. Shanghai as a typical metropolis of China is selected for research. To address such question, we divide Shanghai into 5432 census tracts and calculate basic population in every spatial unit by identifying every user's stable location during 4:00 p.m. to 6:00 p.m. when human mobility is the lowest. Then we compare basic population with daily visit frequency to calculate the amount and the ratio of human flow in each spatial unit. Finally, we combine the strength of human flow with the influential range, the composition, and the temporal law of human flow to extract a dynamic structure of urban space in Shanghai. The result shows that People's

Square enjoys the highest amount of human flow, approaching 2.95 million visitors passing by per square kilometer, which is more than 10 times of its residents, while in suburban areas the average level of human flow is just 4.80 thousand visitors per square kilometer. Additionally, the dynamic structure of human mobility extracted from four dimensions of index is composed of four kinds of features: dynamic surface, from city center to subarea, shows the strength level of daily human mobility; dynamic center, including five center and eleven sub center, becomes the most influential areas in the flowing network; dynamic cluster, can be divided into seven groups according to the composition and temporal law of human flow; dynamic corridor, strongly related to metro lines, highways, and Huangpu River, provides transportation supports for urban population. The findings of the paper help to illustrate a dynamic structure caused by human flow upon the static material spatial structure. The relationship between human mobility and urban structure can also be considered as a key issue which is continue focused on in housing, community development, and transportation field.

MODELLING COMMUTER FLOWS USING MOBILE PHONE SIGNALING DATA: A CASE STUDY OF SHANGHAI, CHINA

Abstract ID: 806

Individual Paper Submission

GU, Jiahuan [Tongji University] gujiahuan1@126.com, presenting author

WANG, De [Tongji University] dewang@tongji.edu.cn, co-author

Abstract: The estimation and prediction of human mobility such as commuter flows is a fundamental aspect of urban spatial structure. Various human mobility and trip distribution models have been proposed in order to describe the commuting flow patterns of people. Here we use a spatially weighted interaction model (SWIM), which combines spatial interaction model and geographically weighted method to reconstruct the “empirical” commuting OD matrix inferred from mobile phone signaling data of Shanghai. The database contains approximately 16 to 18 million anonymous users and 0.7 billion records per day in a two-weeks period. Using an algorithm mainly based on user’s location at night and daytime, we recognize 13.7 million users who have relatively stable residences and workplaces, then we aggregate the 13.7 million commuters to 5432 census areas. Finally, using the number of population and jobs of each census area and the time costs between census areas, we construct an origin-specific spatial weighted interaction model for each unit to estimate commuter flows from one unit to another. The results show that the fit goodness of each model largely lies in an interval between 0.6 and 0.8, and the parameters of each variables vary from ones to ones. The job attractiveness parameters decrease from central city to suburb, especially from major job centers to the peripheral area, which means the way through planning more jobs to reduce commute time in central city maybe more effective than other regions. The distance- or time- decay parameters of census areas in the north and west region is larger than the others, the highest distance-decay ones located in the end of metro lines, which means people in these regions are less sensitive to commute distance or time and are willing to endure long distance commuting. The public transportation parameters in the west and east region of the suburb are larger than other regions, which means the improvement of public transportation in these regions maybe more effective. This work explored a path to model commuter flows using big data, which can inform many applications related to it, ranging from the prediction and simulation

of traffic flows, through the performance evaluation of urban policies related to job centers layout and public transportation construction.

USING CROWDSOURCING, MACHINE LEARNING, AND REMOTE SENSING TO CLASSIFY URBAN FORM INTO LOCAL CLIMATE ZONES AND ASSOCIATIONS WITH URBAN AIR QUALITY

Abstract ID: 850

Individual Paper Submission

LU, Tianjun [Virginia Tech] tianjun@vt.edu, presenting author
ZHANG, Wenwen [Virginia Tech] wenwenz3@vt.edu, co-author
HANKEY, Steve [Virginia Tech] hankey@vt.edu, co-author

Urban air quality is a component of planning for sustainable and healthy cities (Campbell, 1996; Northridge et al., 2003). A small number of studies have explored how urban expansion or urban form is correlated with air quality (e.g., Stone, 2008). These studies typically rely on variables collected by the US Census (e.g., population density, mixing of jobs) but do not include urban morphological information (e.g., building height, form).

Stewart and Oke (2012) defined urban form typologies called Local Climate Zones (LCZs) that classify built and natural environments into 17 categories. LCZs have been widely applied in temperature and climate studies (Middel et al., 2014). However, LCZs are typically developed only for specific study areas, and methods for classification vary by study. In this study, we describe (1) an approach for mapping LCZs across the contiguous US using satellite imagery and machine learning models and (2) an example application of LCZ classifications to explain variation in urban NO₂ concentrations.

Our approach to mapping LCZs is based on a three-step process: (1) develop a training dataset by crowdsourcing classification of satellite imagery of various urban environments, (2) build machine learning models based on the training dataset, and (3) predict LCZs for all urban areas by applying the best trained model to national satellite imagery. The approach allows for consistent measurement and prediction of urban form (LCZs) for the contiguous U.S.

We first developed the training dataset using a crowdsourcing platform called Amazon Mechanical Turk (MTurk). Briefly, we enabled MTurk Workers to simultaneously view satellite imagery and corresponding Google Street View imagery to classify locations of interest. Since our primary interest is urban air quality, we obtained responses for all NO₂ monitoring locations administered by the US EPA (n = 426). We received 10 responses (from unique individuals) for each location; location LCZ type was determined if more than 5 responses voted for the same LCZ. The MTurk responses combined with the corresponding satellite imagery comprised the training dataset. Then, we developed machine learning models (e.g., random forest, gradient boosting) to test the feasibility of predicting LCZs at locations without an EPA monitor. Based on preliminary

machine learning model estimates for a single urban area (Chicago) we estimate the accuracy of LCZ prediction to be 70-90% depending on the LCZ-type.

To explore the correlation between LCZ-type and NO₂ concentrations, we tabulated EPA monitor-based annual-average concentrations and satellite NO₂ measurements (2010-2015). Then, we developed multiple linear regression models at ~330 locations where concentration data was available. Our NO₂ models had reasonable goodness-of-fit (R^2 : ~0.6). Among LCZ types, compact mid-rise areas were associated with higher concentrations; sparsely built areas were negatively correlated with NO₂ concentrations. Our preliminary models indicate that higher concentration areas are typically in more compact neighborhoods which primarily located in central cities (a consistent finding in the literature). However, once we have completed the LCZ machine learning models (to predict LCZ classes across the U.S.), we will also test whether metropolitan areas that have more compact development across the region are associated with improved air quality (mixed findings in the literature owing to difficulty in measuring urban expansion).

To our knowledge, our work is the first study to use crowdsourcing and machine learning methods to obtain LCZ classifications for the contiguous US. As such, our approach could be used to develop a consistent measure of urban form and urban expansion over time for planners. Our preliminary NO₂ models indicate that high concentrations are associated with compact urban form that is located near central cities; future analyses will explore whether metropolitan areas with more compact development are associated with improved regional air quality.

INVESTIGATING THE CAUSAL RELATIONSHIP BETWEEN REAL ESTATE ONLINE NEWS AND HOUSING SALES PRICES: AN APPROACH TO THE SENTIMENT ANALYSIS USING BIG DATA OF SEOUL, KOREA

Abstract ID: 857

Individual Paper Submission

PARK, Jae Soo [Kangwon National University] okparkjaesoo@naver.com, presenting author
LEE, Jae-Su [Kangwon National University] jslee25@kangwon.ac.kr, primary author
WON, Jaewoong [Kyung Hee University] , co-author

The housing price measures play an important role in comprehending both economic and social trends. Previous studies investigating how the housing prices are determined have employed conventional analytical methods, such as linear and nonlinear regression models and time-series models (Sun et al., 2016). However, they commonly fail to consider human behavioral factors which are found to be significant to explain the housing prices. In addition, little is known about the impact of human sentiments revealed from online news articles on housing sales prices. In the era of big data, the sentiments are becoming a more important outcome of both human behavior and social interaction (Li et al., 2016).

The recent advances in the Internet technologies and social media have produced unstructured big data involving textual data. These data can help understand the behavior of individuals and conduct advanced research activities by capturing factors measured as perception or feeling response (Houlihan & Creamer, 2017; Yang & Seng, 2017). In this study, we focus on the textual data from online news articles and attempt to analyze how the information of the textual news relates housing market trends in Seoul, Korea. This study introduces sentiment analysis as a helpful big data analysis method, in order to make sense the relevant information of online news articles. It also intends to identify the causal connections between the sentiment measures and housing prices and forecast housing price trends using them.

The data source is based on the online news release from six major daily newspapers, which is provided online from January 2010 through December 2017 in Korea. The study area is Seoul metropolitan area (SMA), the hottest housing market in Korea. We also pay attention to five sub-regions (core central business district (CBD) area, Northwestern area, Northeastern area, Southwestern area and Southeastern area) to look into the different causal relationships between the sentiment measures and housing prices across the sub-regions. To quantify the textual data, we used the sentiment analysis, which can allow us to extract the sentiment index reflecting positive or negative tone about the housing market. We conduct the Granger causality analysis to examine whether and how the sentiments of the news articles causally affect the housing market trends. In addition, the ARIMAX (multivariate autoregressive integrated moving average) model is employed to quantify how well the sentiment variables forecast housing prices in the regions.

In the preliminary results, the extracted sentiment series are shown to be significantly correlated with housing sales prices in the study areas. The results also shows that the sentiment variables are causally connected with housing prices in most sub-regions and SMA as a whole. It is also helpful to forecast housing prices in the areas. While we found that the sentiments relevant to more positive contents significantly affects housing price index, more in-depth analyses are needed in the future study.

Integrated urban models have a long history but their use in planning practice has a checkered past. Lee (1973) criticized early urban models for committing seven deadly sins, among them being too data hungry. In the intervening years much has changed, including our conceptions of big data and the planning challenges that models are tasked to address. Reduction of greenhouse gas emissions and vehicle miles travelled are critical objectives for metropolitan planning in California and elsewhere, but these objectives increasingly need to be balanced with housing affordability and environmental justice objectives, among others. The policy and planning landscape has also become more diverse and sophisticated, with complex variations of traditional zoning, form-based codes, inclusionary zoning, parking requirements, density bonuses, community benefits, impact fees and subsidies, and various others now influencing development patterns at multiple scales - with considerable emphasis on the site and walking scale.

In this paper and corresponding talk, we address these evolving needs by presenting a new zone-less microsimulation model system based on UrbanSim (Waddell et al, 2007; Waddell, 2011) that uses parcels and local street (Boeing, 2017) and transit networks, along with representations of individual persons, households, jobs, and business establishments to model the dynamic evolution and daily travel patterns of the San Francisco Bay Area. We associate households with individual residential units that have characteristics such as tenure, square footage, bedrooms, and bathrooms. The units are associated with buildings, which are located on parcels, and are linked to the local street network. We analyze accessibility on local street networks, transit networks, and driving networks, and simulate traffic patterns and congestion using a traffic microsimulation model that uses multi-core graphics cards to parallelize processing (Garcia-Dorado et al, 2014).

This system - to our knowledge the first of its kind - enables high-resolution modeling at a sufficient level of performance to support analysis of local and complex land use policies in conjunction with transportation modeling that enables full treatment of walking, biking, and transit on the same basis as driving. Prior models have traditionally privileged driving over other modes by relying on coarse-grained network representations and travel zones that cannot realistically represent walking, biking, and transit options.

The project is funded by the Department of Energy and is part of a larger Smart Mobility project intended to anticipate the impacts of Transportation Network Companies (TNCs) and the rapidly evolving technology for autonomous vehicles (AVs), the potential impacts of which remain poorly understood. Our modeling platform provides a flexible framework to extend as data emerge on the adoption of TNC and AV technologies, and to examine their impacts on urban development, travel patterns, energy consumption, and unintended social and environmental consequences.

In this paper and talk, we describe the architecture of the platform, the tools and data developed to implement it, and initial results from model implementation in the San Francisco Bay Area. We also address its limitations and outline the coming steps and research to bring it into broad practical use.

AGENT BASED MODELING OF INDIVIDUAL BEHAVIOR DYNAMICS ON FLOOD DISASTER RISK ASSESSMENT, A CASE STUDY IN MIAMI BEACH

HAN, Yu [University of Florida] hanyu.bit@gmail.com, presenting author
PENG, Zhong-Ren [University of Florida] , co-author

Coastal communities, including households, businesses, and government entities, are now fully exposed to flooding risk from hurricane and king tights due to climate change and sea level rises. Although individual behavior before, during and after the natural hazards could dramatically reduce the impacts of the disaster, the spatial and economic inequality of individuals on flooding risk results disparate attitudes and behaviors towards flooding risk. Since the behavior of the individual in response to flooding risk does not comply with traditional utility theory of economics, the factors and behaviors that influence individuals' decision on flood risk mitigation needs to be understood. Based on existing literature on behavior economics and flooding management, this paper proposed a general analytical agent-based framework that allows for revealing interactions between individual's rational behavior and coastal flooding management. The preferences and decisions of households on coastal natural hazards are updated through perception of the flooding risk, which are according to the vulnerability of each agent.

Several agents are considered in this study: homeowners for different races, insurer, and government. Each Homeowner can choose whether to adopt a flood protection measures on its house. Homeowners start with an initial attitude of flooding risk based on their house locations, their income, and the knowledge on expected damage of their house from flooding. The perception on flooding risk is updated in each year of simulation based on the economical behaviors of agents and the external impact of hurricane attack. A homeowner has the following protection measures to choose to reduce the risk of flooding: buy insurance on the house, invest in flood defenses, including elevate their house or install pumps, which are a set of discrete options with different economic costs and different level of protection. A single insurer agent was adopted to calculate the insurance costs and coverage for each individual household. Moreover, the government has the role of implementing the overall flood management plans and policies, such as building hazards mitigation infrastructures to reduce the risk of damage in the area.

Miami Beach area was selected as the study area due to its inherent vulnerabilities to tropical cyclone and flooding. Historic climate change data indicates that the sea level have risen about four inches in the last 50 years and will continue rise by 6 to 8 inches by 2030, which means Miami has a higher vulnerability in front of natural hazards. Our model results show that, generally, households' behavior is sensitive to historical flooding events. However, when no flooding happened in the previous year, the flooding protection measures of the community would decrease significantly due to the underestimate of the risk. Based on the simulation results, high risk areas and groups of individuals can be identified, and corresponding planning considerations can be taken into account. Moreover, compared to previous studies in vulnerability assessment of natural hazards, the proposed model provides a scenario analysis tool for studying individual behaviors and responses to flooding mitigation and planning in coastal cities in front of climate change.

DEAL, Brian [University of Illinois at Urbana-Champaign] deal@illinois.edu, presenting author
PAN, Haozhi [University of Illinois] hpan8@illinois.edu, co-author

Drawing on previous literature on urban spatial equilibrium (Lucas and Rossi-Hansberg, 2002) and complex urban systems (Batty, 2008), this research explores how the spatiotemporal evolution of land use structure in Chicago (down to the 30x30-meter resolution) is shaped by connectivity to population and job centers, amenities, and transportation infrastructure. Our three major hypotheses are: 1) in large and complex urban systems, urban structure unfolds around network-based systems; 2) commercial and residential land-uses are determined by factors including but not limited to surrounding firms and labor; and 3) new urban growth patterns are different from existing agglomeration patterns.

In this paper, we examine urban land-use data from the Chicago Metropolitan Statistical Area (MSA) to argue for a theoretical shift from a “distance to CBD” based prototype to one that considers the complexity inherent in urban systems structure. We use a Stochastic Greedy Algorithm to quantify connectivity and attractions to every cell in a landscape (30x30 meters) to existing population and employment centers, Points of Interests (POIs), and highway and major roads. We measure the frequency of commercial and resident land-uses relative to these found attraction levels and develop algorithms that help explain the relations.

Using these methods we find that connectivity to city centers need to be established through actual city networks rather than using Euclidean distances. This is consistent with theories of complex urban system science (Batty, 2008). We also find that proximity to amenities (also using actual network accessibility measures) is an important attractor for residential location choices. This offers a theoretical departure from Lucas and Rossi-Hansberg’s (2002) CBD model of urban structure. Proximity to labor and other establishments on the other hand, are important factors for commercial location choices. Finally, newer urban growth patterns differ pointedly from existing agglomeration patterns with network accessibility now the most important variable for new residential and commercial development patterns.

Our proposed perspective on urban spatial structure and land-use provides an alternative to urban economic policies with spatially explicit implications, such as congestion and geographical knowledge spillover. Our methodology also offers a new, policy driven, calibration methodology for the improvement of urban land-use change models and connected planning support systems.

AUTONOMOUS VEHICLES: A POTENTIAL THREAT TO ACTIVE TRAVEL?

Abstract ID: 1056
Individual Paper Submission

GARG, Vipul [University of British Columbia] 30.vipulgarg@gmail.com, presenting author
HONG, Andy [University of British Columbia] andyhong@gmail.com, primary author
ZHANG, Wenwen [Virginia Tech] wunwunchang@gmail.com, co-author

Background:

Autonomous vehicles (AV) are getting much attention in media for their potential to improve quality of life. Many studies have examined how AVs will change vehicle ownership and people's travel behavior (Harper et al., 2016; Lavieri et al., 2017; Zhang et al., forthcoming). Consensus has been reached that both Privately owned AVs (PAVs) and Shared AVs (SAVs) will both result in an increase in vehicle miles traveled (VMT) and reduced vehicle ownership. However, little understanding has been gained regarding how AVs will influence active travel. Most literature has emphasized on ethical issues regarding how AVs should react when encountering pedestrians and bikers. AVs by providing convenient point-to-point mobility may result in significant reduction in walking and cycling (Rojas-Rueda et al., 2017). To fill this research gap, this study examines how PAVs and SAVs, especially the costs of trips, will influence active travel behaviors.

Methods:

We used household, individual, and short trips (<1 mile) data from the 2009 National Household Travel Survey (NHTS) to examine whether AVs can be a potential threat to active travel for short distance trips. We first used machine learning models, including ridge regression, support vector machine, random forest, gradient boosting, and tree-based models, to predict active travel mode, using individual, household, and trip characteristics, especially travel costs including time costs and vehicle operational costs (further divided into in-vehicle costs and out of vehicle costs). Based on previous literature, the travel costs in the era of PAVs and SAVs are then updated for various scenarios, including (1) mile-based costs, ranging from \$0.15 to \$0.40 for SAV and \$0.30 - \$0.50 for PAVs; (2) anticipated waiting time for SAVs from 2 to 10 minutes; and (3) discount for in-vehicle travel time cost ranging from 10% to 50%. Best trained machine learning model is then applied to determine mode split between active travel and vehicle travel.

Results:

The preliminary results from the updated model run show that PAVs will not significantly reduce active travel mode (only replacing less than 10% (weighted) of active travel trips), especially when PAVs are expensive and the discount for in-vehicle travel time cost is small. Compared with PAVs, SAVs are more disruptive because the travel option is more affordable and vehicle ownership is not a prerequisite. If SAVs can operate at \$0.15/mile, show up in around 2 minutes, and provide 50% discount in in-vehicle travel time costs, they are likely to replace 42.3% (weighted) of active travel to auto travel. The results also suggest that out of vehicle waiting time is critical for travelers to choose between SAVs and active travel. AVs can potentially replace a larger share of active travel if active travelers become more concerned about road safety issues with autonomous vehicles.

Significance:

Results will inform policy makers about potential implications of AVs on active travel mode share. This study offers insights to urban planners to proactively adjust land use regulation and zoning ordinance to mitigate the negative impact of AVs on active travel. The results from this study suggest that without policy interventions, the AVs will reduce the share of walking and cycling. To encourage active travel, centralized drop-off zones and pedestrian and biker friendly roadways may be planned (using some of the current parking lots and on-street parking spaces) to encourage active travel behavior. Moreover, curbside drop-off fees may also be considered to promote active travel and reduce congestion in the future.

BUILDING LOCATION HISTORY WITH GPS DATA FOR OLDER ADULTS

Abstract ID: 1064

Individual Paper Submission

CHOI, Ji Min [University at Buffalo, The State University of New York] jchoi32@buffalo.edu, presenting author
KANG, Bumjoon [University at Buffalo, The State University of New York] bumjoonk@buffalo.edu, primary author

Background

Location history data are necessary to measure the full range of spatial exposure (Chaix et al., 2013). Self-reported location diary has been widely used; however, they are inaccurate (Bowling, 2005) due to proxy reporting and potential recall bias, especially for older adults. Recent studies began to use location-aware technologies such as GPS data to objectively measure location history. When we have the raw GPS data, there are still needs to reduce the fine-grain location data into visited locations (e.g., clusters) to build individual-level location history data (Thierry, Chaix, & Kestens, 2013). Existing methods using GPS data such as rule-based models, a density-based algorithm, or fuzzy classification and scale-adaptive clustering method have limitations of validity or operational challenges involving complex data processing (Thierry et al., 2013; Wan, Kan, & Wilson, 2017).

Objective

The current study aimed to develop a simplified method to automatically build location history data (where individuals visited) using GPS data. We also compared our objective location history data to participants' subjective location data.

Methods

Data were collected from 31 older adults living independently in Buffalo-Niagara Falls Metropolitan area from March to September in 2016. They were asked to wear a GPS unit (QSTARZ BT-Q1000XT) and an activity monitor (ActiGraph wGT3X-BT) for 7 consecutive days and to record perception of visited locations and mobility using the Life Space Assessment (LSA) instrument (Peel et al., 2005).

From the collected data, we made ground truth data by manually classifying the GPS data using ArcMap (ArcGIS 10.3.1). In the manual classification, continuous GPS data were clustered sequentially into time intervals using a ground-rule (a change in a speed value from/to 10km/h to/from 2km/h or increase in VM counts to 1000). Next, we established a Random Forest (RF) model to predict whether a GPS location forms a cluster (stay) or not (moving) for all non-home GPS locations. Activity counts, speed, inclinometer, and location characteristics were entered in the model.

We compared our results with participants' subjective perceptions of their visited locations. The GPS-determined location history was translated into LSA measures and the values were compared to subjective LSA measures.

Results

A total of 80,462 GPS observations were included after removing invalid data. A RF model was constructed using a training sample of 10,000 observations. The mean square error of RF cluster prediction was 0.0682. The variable importance was ranked from average speed in 2.5 min, average speed in 4.5 min, speed, average vector magnitude counts in 4.5 min, average vector magnitude counts in 2.5 min, and etc., indicating a great importance of speed in determining the cluster. A total of 594 clusters were detected from the true dataset and 671 clusters were detected using a prediction dataset with staying time greater than 2 min. When the results were compared to subjective LSA measures, our objective data covered larger areas than subjective data, suggesting that subjective data may be biased with underreported locations.

Conclusion

The proposed automated location history method using GPS data showed accurate results when compared to the ground truth sample. Perceptions of visited locations (LSA measures) were inaccurate, compared to objective GPS data.

XIONG, Zhekun [MIT] xiongzk@mit.edu, co-author

Developing robust and effective methods of studying public spaces that result in more informed decision making has been a challenge for urban designers. Kevin Lynch (1984) and William Whyte (1980) both developed notable methods to quantify and interpret urban spaces using detailed data analytics. Sensor networks, such as cell phones and the Internet of Things (IoT) have created big data sets that have radically changed our ability to measure the urban environment both in time and space. However this new data can often be hard to obtain, and when analyzed it usually does not evaluate smaller public areas such as parks or tactical urbanism projects. To address this issue, our research team developed a downloadable toolkit which measures the quality of urban space using a set of sensors embedded into a bench. Recognizing that the public realm functions differently across countries, cultures, and even cities, the team developed data collection and analysis methods that anyone around the world can augment, iterate, and customize. The furniture, sensors, and software are all Do-it-Yourself (DIY), allowing anyone to replicate. Benchmark toolkit measures “Public Life,” a term often referenced in Jan Gehl’s work (2013) that refers to citizens’ daily interactions with others within the built environment. The Gehl methodology records the “human scale of people’s activities and interactions” using in-person observations. Benchmark tested whether these measurements could be automated to create an open source tool to measure the quality of public space. Software developed for Benchmark uses machine learning techniques to analyze the data which is then transformed into visualizations for decision making. Results of three field tests showed that 1) applying machine learning techniques on images acquired from the benches proved to have the best results for measuring public life over other sensors embedded in the bench. 2) Benchmark was easy for others to replicate but could use some design refinements to make it easier for users to build themselves. 3) Users could analyze the data themselves if provided with the proper tools. The machine learning algorithms and the design of the benches could be improved, but the first release of Benchmark proved that it is possible to create an open source data measurement tool to build data sets to quantify human interaction and social cohesion within our public spaces.

The research paper will start with a literature review detailing the ways Urban Designers have attempted to measure public space. Including Lynch (1984) and Whyte (1980), to more recent technology focused methods, including in Hillier’s space syntax (1983, 1998, 2008) and Ratti et al. (2011). The paper will also review Do-it-Yourself (DIY) sensors, most of which have been developed in the field of environmental sensing. Then we will also discuss at other attempts of embedding sensors into street furniture. The literature will help frame the need for measuring urban space and show Benchmark is a Do-it-Yourself innovation - which can be used for pop-up

spaces and tactical urbanism projects. The literature framing will be followed by a presentation of the results from three field test of Benchmark, including one performed in collaboration with Build a Better Block. Data analytics and visualization results will be presented evaluated along with a discussion of machine learning techniques for measuring urban space. Improvements can be made both to the bench design and algorithms, and future directions of the research will be discussed.

THE PURSUIT OF HAPPINESS: ASSESSING THE UTILITY OF GEO-SOCIAL MEDIA DATA AND GIS IN MEASURING NEIGHBORHOOD LIFE SATISFACTION IN TURIN, ITALY.

Abstract ID: 1118

Individual Paper Submission

RYBARCZYK, Greg [University of Michigan-Flint] grybar@gmail.com, presenting author

Central theme

Assessing life satisfaction at the neighborhood scale has long been a focus area for researchers (Jokela, Bleidorn, Lamb, Gosling, & Rentfrow, 2015). The major weaknesses of previous studies have been the use of untimely and aggregated data that is tangentially linked to mental health, which could be in part attributed to standard data collection methods, such as survey instruments (Mitchell, Frank, Harris, Dodds, & Danforth, 2013). The advent of geosocial-media (GSM) data however, has opened-up new channels of exploring the link between life satisfaction and place (Frank, Mitchell, Dodds, & Danforth, 2013). The data contains three attributes which sets it apart from other data: a timestamp, location, and syntax. These can collectively reveal previously unknown psychosocial relations to one's environment. Our main goal was to harness this information and answer the question: can we measure and understand the influence of neighborhood composition, environment, transportation, and time on life satisfaction using GSM?

Approach and methods

The GSM data was obtained from the Twitter open-source API. The database was filtered and used to derive a valance (i.e. sentiment) index. Compositional and contextual information for each statistical zone were then collected from government sources and then linked to the Twitter database using GIS. The zonal indicators included in this research consisted of: public health, infrastructure, travel safety, incivilities, accessibility, socioeconomic standing, and density. Exploratory spatial data analysis (ESDA), GIS, and spatial regression modeling were implemented to investigate the spatial patterning of sentiments, and highlight important explanatory factors associated with increased or decreased values.

Results

The ESDA results showed that the spatial patterning of Tweets clustered near the central portion of the city. Unsurprisingly, it was also found that sentiment values differed depending on time-indicating the importance of temporality on life satisfaction when neighborhood effects are controlled for. The regression model's diagnostics were marginal ($R^2 = .03$) though revealed statistically significant relations ($p\text{-value} < .05$) to sentiments. Most notably, urban density, mortality rates, and disturbances negatively affected values, while pedestrian infrastructure had the opposite influence. The results validate a growing body of work on how urban stressors affect life satisfaction spatially and within neighborhoods.

Conclusions

The research has provided valuable evidence on the nuanced relationships among mental health, neighborhood, time, and space. Our results show how GSM may potentially be used to estimate neighborhood life satisfaction, when neighborhood effects are controlled for. We expect the results of this research to be valuable for practitioners and researchers on two fronts. First, the models' displayed several noteworthy coefficients indicating the importance of time, space, and neighborhood effects on life satisfaction. Second, we showed that the combination of GSM data and GIS is valid approach that could be used to examine mental health in neighborhoods in other cities.

HAS OPEN DATA TRANSFORMED CITIES AND THEIR INTERACTIONS WITH CITIZENS?

Abstract ID: 1201

Individual Paper Submission

SIEBER, Renee [McGill University] renee.sieber@mcgill.ca, presenting author

Municipal governments have increasingly made open data a mission critical part of their public services. Large amounts of data are generated by municipalities (e.g., roads, parks, water/sewer, facilities, services, and demographic profiles), which are provided through open data portals to be used by the private sector, researchers, other levels of government, and importantly, residents. Open data is defined as the freedom to use and repurpose with few to no legal restrictions (Open Knowledge Foundation, nd). The motivation for opening up data is multiply determined. It is promoted as a method of ensuring a transparent and accountable government. Open data is seen as a source of potential economic development. In Canada, open data has been called the natural resource of the 21st century (Clement 2014). Open data also has potential for intra-jurisdictional data sharing (e.g., for business intelligence) and inter-jurisdictional collaboration (Sieber and Johnson 2015). The promises of open data often are hyperbolic—open data will revolutionize citizen participation!—even as open data provisioning is established as a routine practice for cities. Hyperbole is problematic considering that assessing any transformational potential of open data is quite difficult.

This paper reports on the ways in which open data has altered the dynamic between local governments and its constituents. It attempts to answer the question whether open data has transformed city-citizen interactions to any significant degree. The paper draws on a five-year project on the publishing and use of open data in cities. It utilizes case study research conducted in eight major cities in Canada to render an assessment. The findings from this research include the following.

First, opening up data is conditioned by the underlying motivations for its release, which can conflict with each other (e.g., transparency and economic development). Indeed, there is a magic concept quality (Pollitt and Hupe

2011) to the drivers of open data. Open data, like other magic concepts appear broad in scope, possess normative attractiveness and imply consensus among the numerous stakeholders in its provisioning.

Second, conflicting motivations complicate determination of success of open data. Because open data provision by design is agnostic as to who is downloading the data and how it is used, there are few mechanisms to ascertain how the data is being valued external to the municipality.

Third, uncertainty exists about the role of planners in the supply side of open data. Planners are a primary source in the collection of open data, but this paper finds few are involved in publishing open data or crafting open data standards. Planners rarely lead open data initiatives.

Lastly, there is significant need for information intermediaries to “interpret” the raw data to the citizenry. This counters a dominant discourse in open data provision that the act of publishing alone leads inexorably to value, for example in government accountability. These infomediaries include organizations like community nonprofits, activities such as hackathons, and applications like geovisualizations.

It is hoped that this work improves planning praxis by expanding the understanding of why municipalities are currently motivated to open up data, what values are attained, and whether a transformative potential is realized.

UNDERSTANDING HUMAN RESPONSES TO HURRICANE MATTHEW: A BIG-DATA APPROACH

Abstract ID: 1242

Individual Paper Submission

DENG, Yujun [University of Florida] dengyujun11@ufl.edu, presenting author

WANG, Sheng [Tongji University] wangs_tj@tongji.edu.cn, co-author

LIU, Juecheng [University of Florida] ljuecheng@ufl.edu, co-author

PENG, Zhong-Ren [University of Florida] , co-author

Impacts of hurricanes are complicated and diverse to measure especially for mental health (Galea et al., 2007). Post-disaster stress is one major issue induced by hurricanes, and the recovery is difficult and uncertain (Abramson & Redlener, 2013; Kessler et al., 2008; Neria & Shultz, 2012; Reardon, 2015). To reduce the risk of people having post-disaster stress, proactive interventions are the most efficient approach compared with passive approaches (Reardon, 2015). However, the proactive investigation of human response to hurricanes is difficult and not feasible by traditional paper-based surveys, and short-term thinking plays more important role than long-term strategic planning when facing with such extreme conditions. To measure the human responses to hurricanes in real-time and further provide insights for real-time urban management, Big Data provides an unprecedented opportunity for this target with powerful analysis tools and large scale of real-time data. Thus, this study collected Twitter data during hurricane season in Tampa Bay Area in 2016. During this period, the impacts of Hurricane Matthew on Tampa Bay Area is witnessed. To develop real-time urban analytics regarding local human responses under Hurricane Matthew, this study employs natural language processing, knowledge graph and

network modeling methods on Twitter data to detect public sentiments and concerns for people in Tampa Bay Area under Hurricane Matthew. By combining sentiment analysis and relation extraction, this study can detect how Hurricane Matthew affects people's sentiments and what people are concerned with in real-time. This study shows the spatiotemporal distribution of negative sentiments in Tampa Bay Area under Hurricane Matthew and examined the influential factors affecting people's responses to Hurricane Matthew. The public concerns including traffic congestion, visualization of potential damage, and future protection can be derived from people's tweets in real-time, which can be further developed into a knowledge graph to examine the relationship among these concerns. There are three primary findings. First, the detected negative sentiments could indicate the possibility of post-disaster stress geographically. Geo-tagged tweets could indicate the geographic location of users, which shows how potentially stressed users distribute in Tampa Bay Area. Second, public concerns induced by Hurricane Matthew can be understood such as the evacuation routes. During different phases under Hurricane Matthew, public concerns dynamically change and mainly focus on transportation. Third, the people who are vulnerable to post-disaster stress tend to be from low-income and minority neighborhoods. Our repeatable research provides real-time urban analytics to detect potential post-disaster stress and understand public concerns, which can facilitate the proactive intervention for reducing post-disaster stress and improve the understanding of indirect impacts of hurricanes on local communities. This study also improves the short-term thinking of urbanists including planners and scholars about urban management, which becomes increasingly important in urban planning because of growing complexity of urban system (Batty, 2013).

PUBLIC & PRIVATE PARTICIPATION GEOGRAPHIC INFORMATION SYSTEMS: INTRODUCING P3GIS

Abstract ID: 1258

Individual Paper Submission

THOMPSON, Michelle [University of New Orleans] mmthomp1@uno.edu, presenting author

Through every swipe of a credit card, information is gathered on what is being purchased, who is doing the purchasing, and how much they are spending. After the swipe, market analysts then use this information— called “market segmentation data,” or MSD— to predict future purchase behavior, which helps organizations make business and policy decisions. How this information is used has far-reaching impacts and can expand or inhibit regional economic development, neighborhood growth, and the individual quality of life for those living in areas affected by this. If the MSD for a particular area does not include all potential purchases by a comprehensive demographic, there is an inherent limit on the products and resources made available to that market. This is common amongst marginalized, disinvested and/or redlined communities, where there is limited proximity to financial services such as banks. Using market segmentation data may then be a false predictor when estimating the spending behaviors of this community, because it does not actually represent their full purchasing power.

Instead of banks, communities like this are more likely to see an increase of alternative financial services (e.g. payday loan shops and check cashers). These alternatives, while convenient, have extremely high transaction costs and do not support long-term individual or community wealth.

Public Participation Geographic Information Systems (PPGIS), is a bottom-up model of which has been used to evaluate neighborhood health, wealth, and quality of life by using a top down/bottom up model to integrate community, university, and municipal information.

This “public” or neighborhood knowledge is critically important, but cannot be easily integrated with federal or state level consumer data. The difficulty of integration lies particularly in the scale of the information; federal census data is available at the block level, US Housing & Urban Development data at the household and neighborhood level, and community-based service data at the individual and/or household level. Due to the form and scale of the information, datasets cannot be easily combined and used in municipal planning or public policy action plans.

The final missing piece to this puzzle is often inaccessible to community advocates and governments alike: private transaction data. Private consumer data is typically closely guarded by financial companies, but this information could help integrate all the above sources into a new model for predicting the behavior of market segments, which is used to understand resident wealth and consumer demand. By having a “middle data” solution, citizen scientists (community planners with expertise in converting neighborhood knowledge into spatially-referenced data) can expand the use and understanding of transaction data, so as to better evaluate the purchasing power of at-risk communities.

In the p3GIS model, ‘public’ will include community voices, municipal data, and national data that provides a composite neighborhood profile. Private data sources that are customized and reference real-time transactions that can be used to evaluate consumer preference, demands, and wealth will also be included.

Results from this study helps to identify and address barriers to financial access, point to new needs and types of financial services, and provide innovative data streams to sufficiently predict spending behaviors. Using big data to identify trends then conducting validation using small data may encourage providers to explore new products, innovative policies, and financial services in marginalized communities. The lack of adequate data sources that fill the void created by cash sales will improve representation of underserved markets that have substantial wealth and market potential. We hope that this demonstration project will be a starting point for other innovative programs to initiate projects using a model that puts the community first.

EXPLORING GEODESIGN: USING THREE-DIMENSIONAL PARAMETRIC MODELING TECHNIQUES IN CONJUNCTION WITH TWO-DIMENSIONAL LAND USE MODELS TO BETTER VISUALIZE FUTURE GROWTH

Abstract ID: 1278

Individual Paper Submission

DUAN, Leilei [University of Florida] dll1989@ufl.edu, presenting author
ZWICK, Paul [University of Florida] , co-author

Problem: Increasing evidence suggests that population increase is related to various challenges human character; for instance, there has been approved to be a tight relationship between population growth and environmental issues, resources allocation challenges, economic status of the region, etc. (Ehrlich & Holdren, 1971) Responding to this issue, various urban allocation models have been proposed to assist with better decision making. However, there lacked an effort to identify proper allocation sites considering both physical suitable land, and quality of life improvement. Also, existing land-use and population allocation models typically allocate future employment and residential population in two-dimensions (2D), missing the opportunity to provide three-dimensional (3D) buildings for employment and residential use. While population and employment projections inform planners about the future growth of the city, planners still need to make decisions about where and to what extent the future growth will be allocated. A more comprehensive yet flexible method is needed to provide support for planning decision making in three dimensions, and to provide greater flexibility for 3D visualization.

Research Objective: This research aims to detect potential land-use development opportunities based on a quality of life index and land use suitability analysis. Additionally, a workflow is created to automatically visualize and simulate future land-use and population allocations in 3D. Furthermore, this research also explores the potential of creating allocation scenarios driven by 3D models. The results from this research can be used to perform impact analysis for different future growth scenarios, such as transportation analysis, noise analysis, air pollution analysis, and the impact analysis to ecosystem.

Existing Research: The existing work in this area is mainly focused in examining the development opportunity based on land use suitability. While there are efforts to perform land use analysis to indicate future allocation, there is barely research to examine whether the land use analysis results fit people's anticipation of a high-quality life. Besides, the majority of existing research mainly focused in allocating population in two dimensions.

Methodology: Built environment related quality of life is examined from three aspects: urban design criteria, public transportation accessibility, and socioeconomic status. Land-Use Conflict Identification Strategy (LUCIS) was used to perform land use suitability analysis. Quality of life results are integrated with LUCIS results to better inform allocation site selections and allocation process. Procedural modeling techniques was used to generate 3D models representing allocation scenarios, in corporation of urban design guidelines. City of Tampa, Florida is used as the case study for this research.

Results & Contributions: Trend scenario, in which allocation process only considers land use suitability results, is compared to urban-form-oriented allocation scenario, in which both quality of life and land use suitability results are considered to visualize allocation results in 3D models. Socioeconomic outcomes are analyzed and compared from both scenarios. This research forms a methodology for decision makers to easily visualize and compare different urban future growth outcomes.

PENCILER: AN AFFORDABLE HOUSING DEVELOPMENT FEASIBILITY ANALYSIS PLATFORM

WHITCOMB, Christiana [University of California, Berkeley] christiana@urbansim.com, presenting author
WADDELL, Paul [University of California Berkeley] Waddell@berkeley.edu, primary author

Analyses of the feasibility of affordable housing development are rare (Walker, 2010; Rowley et al, 2012; Whitehead, 2007). Penciler is a web-based, site-level multifamily housing development feasibility tool developed for the Mayor's Office of Housing and Community Development in San Francisco to use during the acquisition phase of the multifamily housing development process. Penciler gives the user a quick picture of the feasibility of a site from a building program, development cost and financial perspective. Drawing on local site data, planning codes, and building codes, the user can quickly generate many different building iterations on the same site and compare costs and sources of funds for each iteration, helping to better inform site acquisition and site redevelopment decisions.

For each potential development site the user navigates between three interconnected tools: Buildings, Development Costs, and Financial Feasibility. Penciler is connected to the San Francisco Property Information Map, which provides information on parcel geometry, parcel zoning and allowable building height based on either an address or parcel ID entered by the user.

The core of Penciler is an algorithm that geometrically optimizes unit count on a site given the zoning constraints of the site and the building program requirements of the user. The algorithm optimizes building typology and unit count given all the requirements of the user including non-residential spaces and commercial spaces. The building layouts generated are not intended to replace an architectural floorplan but rather to give the user a sense of what unit count and mix would be possible on the site during a site feasibility analysis.

While many of the zoning constraints are auto-populated from a database of the physical constraints in the planning code, the user can edit any of the above variables in order to understand the feasibility impacts of different program decisions. The user can save custom zonings to account for typical zoning modifications. For example, if a city regularly allows for parking modifications for C-3 zoning in a particular area, this can be saved as its own zoning type so that the user doesn't have to make the same modification every time. These custom zonings can also be found in the zoning drop-down menu on the building iterations form.

The work to develop this tool for San Francisco is now being generalized for adaptation to other cities, initially Vancouver, BC. There are of course many cities facing similar housing affordability crises that could benefit from a rapid assessment of the feasibility of affordable housing development, including the estimation of the maximum building program that is feasible on a site. Future work includes adaptation to district and city-wide analysis of housing policies such as inclusionary zoning.

HOW DOES LAND USE MIX CHANGES IN THE U.S? - ANALYSIS OF LAND USE MIX DYNAMICS USING LODS CENSUS BLOCK LEVEL DATA FROM 2002 TO 2015.

Abstract ID: 1295
Individual Paper Submission

CHEN, Yan [University of North Carolina at Chapel Hill] yanc@live.unc.edu, presenting author

Since Jane Jacobs(1961), the land use mix has always been one of the central value in the urban planning field. Still several engrained attitudes about city planning during that period undermined attempts to create more active and culturally confident cities (Montgomery, 1998). However, since the start of the millennium, the redevelopment of central cities in the United States has been reported in many metropolitan areas across the country, especially after the end of the Great Recession. Although preference for a suburban life has not faded in the West, particularly in North America, many groups have been considering land use mix as a more desirable way of built environment pattern. Therefore it would be very interesting to examine the dynamic of land use changes in the last decades to see how does this trend turns out.

The land use data in this article is using the LODES (LEHD Origin-Destination Employment Statistics) data provided by U.S Census Bureau, which has been used as a valid source for measuring land use mix in many other studies (Ramsey and Bell, 2014). There have been many metrics created to describe the land use mix quantitatively (Song et al., 2013). However, few of them are ready to be applied at the extremely small spatial unit like census block. Therefore we renovated the traditional Shannon entropy equation to improve its performance. Finally, a dataset of land use mix change trajectories for 247,2261 census block in continent U.S from 2002 to 2015 will be created. Then we will apply the unsupervised machine learning k-means classification to identify the major typologies of these trajectories as land use mix change dynamics based on their main statistical parameters. Their character and spatial distributions patterns will be further summarized and compared among different U.S administrative divisions.

This study will use big data analytics to summarize the recent trend of land use mix developments quantitatively, therefore, offer discussion and recommendations for the future urban planning scholar and practitioners.

FROM BITS TO MILES: MINING SMARTPHONE DATA TO RE-EXAMINE THE LAND USE AND TRANSPORTATION LINKAGE

Abstract ID: 1306

Individual Paper Submission

JIANG, Shan [MIT] shanjiang@mit.edu, presenting author

The relationship between land use and transportation (LUT) has long been examined by urban economists and planners using various approaches and numerous case studies worldwide. The majority of previous studies depend on travel surveys with limited sample sizes and short observation period (Ewing and Cervero, 2010). With the advancement of information and communication technology, high penetration of smart devices in our daily lives, and massively open GIS data on the built environment and transport networks, it introduces possibilities for planers to re-examine this old yet critical topic with new lenses.

Recent studies have made progress in studying urban mobility using cellphone call detail record (CDR) data collected by mobile network operators for billing purposes (e.g., Alexander, et al., 2015; Jiang et al. 2016). However, such CDR data are often limited in their sizeable spatial uncertainty (due to the wireless technology and fixed distribution of the cellular towers). With the advancement in mobile location-based service (LBS) for GPS-enabled smartphones, it is now possible to passively mark the devices' whereabouts in higher spatial resolution (from 10 to 100 meter) and ping frequency, which allows us to relate them with land use types more accurately.

In this study, we analyze an anonymous set of large-scale GPS-enabled smartphone data representing activities of more than 200,000 anonymous smart devices over one month in the Boston metropolitan area, collected by a popular LBS company. By mining their digital footprints, we first derive the anonymous smartphone users' activity anchor locations and individual daily mobility networks by trip purpose. We then aggregate the individual travel to population-level mobility demand using the estimated phone users' sample weights at the census tract level. To validate our estimation, we compare the travel demand (origin-destination matrix) with Boston MPO estimated model results and regional travel surveys. Finally, by combining point-of-interest (POI), land use data, and the estimated travel demand, we re-examine the relationship between land use and travel at the metropolitan level. Disruptive mobility technology (employed by TNCs) has made today's urban travel more diverse and rapidly changing than ever before. This study provides a robust and replicable approach for cities to re-examine the linkage between land use and travel in the new information age.

DEVELOPING SCENARIO-BASED HYDROLOGICAL GIS MODELING FRAMEWORK TO REDUCE HUMAN HEALTH RISKS FROM WATERBORNE CONCENTRATED ANIMAL FEEDING OPERATIONS (CAFOS) IN NORTH CAROLINA

Abstract ID: 1378

Individual Paper Submission

SUNG, Sangwoo "Marty" [East Carolina University] sungs16@ecu.edu, presenting author
HOCHARD, Jacob [East Carolina University] HOCHARDJ15@ECU.EDU, co-author
ETHERIDGE, Randall [East Carolina University] ETHERIDGEJ15@ECU.EDU, co-author
PERALTA, Ariane L. [East Carolina University] PERALTAA@ECU.EDU, co-author

Although CAFOs (Concentrated Animal Feeding Operations) are strong drivers in creating local jobs and community investment opportunities in many states, they are also major producers of waterborne contaminants that increase the health risks of local communities in upstream and downstream of a river basin (Burkholder et al, 2007). The health consequences of community exposure to CAFO-linked waterborne contaminants have been poorly understood because the dispersion of contaminants, pathways to human exposure and susceptibility of exposed individuals were difficult to trace before (Cole et al, 2000). These limitations hindered planners' ability to contemplate planning strategies to reduce the exposure impact of water pollution to local communities. Nonetheless, since GIS technology and geographic data are widely used in practice, planners can access richer topographic ground surface models and spatial data of human health than before to identify major contributors (CAFO densities, impermeable landcover, flooding), or alleviators (riparian buffer strips, vegetative buffers) to downstream health risk (Rothenberger, 2009).

In this study, we develop a Scenario-based Geographic Information System (GIS) simulation modeling framework using Python Script to examine the direct effects of upstream CAFOs on local water quality and the direct effects of local water quality on downstream community health outcomes. The major objective of this study is to develop a customizable hydrological GIS modeling framework by combining ArcGIS ModelBuilders geoprocessing tools (ESRI,2011) and Python scripts so that planners can easily visualize health risk outcomes in downstream communities under different natural investment (ecological alteration) or public infrastructure investment scenarios. Although various hydrological and hydraulic models are discussed in the literature, many

models are still computationally intensive in processing and are not suitable to analyze the behavior of hydrologic flow with multiple alternative scenarios encompassing larger than multiple counties or a basin scale.

For study case, we chose eastern North Carolina's Cape Fear River Basin boundary with six counties including Duplin and Sampson, which are the nation's leading swine producers with 4.4 million hog capacity and 1,600 waste lagoons, and with more than 1,000 swine-based CAFOs.

We use a high-resolution void-filled digital elevation model (DEM) and aerial photo-geometric imagery for terrain processing. The product of the topographic/hydrological analysis is a set of all parcels and corresponding CAFO operations located within their respective catchments. The modeling framework constructs a unique pour point capturing the residence-specific catchment at the parcel's point of maximum flow accumulation and estimated water contamination level (exposure variables) for more than 373,000 parcels that also stores the health outcome variables. This modeling framework also identifies health-vulnerability hotspots and natural capital (i.e., riparian buffer strips, impermeable soils, vegetative buffers, and shelterbelts) hotspots, located within our six study area counties, based on temporal and atemporal stressors. This GIS simulation framework allows users to test the effectiveness of different implementation strategies to diminish health risks to downstream communities.

In this study, we conclude that our scenario-based GIS modeling framework can enrich the discussion of community-led mitigation effort to reduce human health risks. We also conclude that GIS modeling framework discussed in this study can provide informative visualization outcomes that would promote targeted investments into public infrastructure and natural capital to expand the flows of public services and ecosystem services to at-risk households.

SPATIAL DEVELOPMENT AND ENERGY CONSUMPTION PATTERNS: INVESTIGATING THE RELATIONSHIP BETWEEN URBAN DENSITY AND BUILDING ENERGY USE

Abstract ID: 1384

Individual Paper Submission

MOSTAFAVI, Nariman [Drexel University] sm3892@drexel.edu, presenting author
HERIS, Mehdi [University of Colorado Denver] mehdi.haris@colorado.edu, co-author
HOQUE, Simi [Drexel University] sth55@drexel.edu, co-author

The Integrated Urban Metabolism Analysis Tool (IUMAT) is a bottom-up quantitative framework for the assessment of resource consumption patterns and environmental impacts associated with different development scenarios at urban scales (Mostafavi, Farzinmoghdam & Hoque, 2017). In this work, within IUMAT, we study the impact of urban density on building energy consumption profiles for six different metropolitan areas in the United States. Neighborhood characteristics can influence the choices made by urban actors as well as natural urban energy flows. First, we introduce a method to classify 30x30 m cells into five categories of settlement density (high, medium and low density, suburbs, and urban fringes), using US Geological Survey's National Land Cover Data-set (NLCD), US Census, and Census Block data (Heris, 2017). In the next step, generalized linear model (GLM) techniques are applied to energy data from Boston, Philadelphia, Austin, Denver, New York City

and Los Angeles metropolitan areas to explain the links between urban density -as a major indicator of urban form- and building energy performance (Ewing & Rong, 2008; Fitcher & Mills, 2013; Yamagata and Seya, 2013). By exploring the Census data from 1990 to 2010, we elaborate on the changes in the metropolitan structure (sprawl and growth rate) of the areas of interest, and provide projections about future development scenarios and their impact on energy consumption patterns in relation to settlement density and growth trends. Creating a universal urban density classification method enables us to compare the spatial structure of the six metropolitan areas and the impacts on energy use patterns. Our results show that urban density is highly correlated with energy use, but its impact is not similar across different metropolitan areas. We also discuss the challenges of improving urban density indicators to allow integrated population, physical environment, and traffic assessment applications.

EXPLORING THE SPATIOTEMPORAL RELATIONSHIP BETWEEN CHICAGO'S LARGE LOT PROGRAM AND NEIGHBORHOOD RATES OF CRIME

Abstract ID: 536

Poster

STRANSKY, Steven [Ball State University] ststransky@bsu.edu, primary author

YOO, Sanglim [Ball State University] syoo@bsu.edu, presenting author

While crime rates nationally are lower than at any point in recent American history, criminal activity remains a challenge for cities across the country. It is particularly true in the city of Chicago, Illinois where gun violence and homicides have reached record levels this decade where the South Side neighborhoods accounted for 45% of the increased homicides across the city (University of Chicago Crime Lab, 2017). Yet as violence has increased this decade, in some South Side neighborhoods where city launched Large Lot program, some differences were observed. Established in 2014, Chicago's Large Lot program, which sells city-owned vacant parcels to nearby homeowners for \$1 each, was a city of Chicago neighborhood stabilization initiative to help property owners, block curbs, and non-profit groups in selected Chicago neighborhoods. As of late November 2017, shootings were down 44% and homicides were down 45% over 2016 (Sweeney, 2017).

Numerous recent empirical studies have found a statistically significant relationship between the remediation of vacant lots and decreasing incidents of crime in the local area (e.g., Philadelphia, PA (Branas et al., 2012; Branass et al., 2016); Youngstown, OH (Kondo et al., 2016); Flint, MI (Sadler et al., 2017)). Those studies all considered the remediation of blighted city lots as the transforming these lots into green space for community and/or private reuse. To the best of our knowledge, however, there is a limited study that has examined whether the transfer and remediation of vacant lots from absent, public ownership into local, private ownership, without consideration of the lots' post-sale land uses, in and of itself has a statistically-significant impact on local crime. This paper tried to fill this gap.

This study examines the impact of the city of Chicago's Large Lot Program to the incidents of local crime. This study uses two spatial-statistical approaches, emerging and optimized hot spot analysis, to analyze the impact of the program on incidents of crime within 500 feet of lots sold in the program's first year. Using the location of 440 parcels sold in 2014 and crime data reported between the year 2013 and 2017, optimized hot spot analysis and emerging hot spot analysis tools were applied to test the impact of the Large Lot Program on local incidences of crime. As emerging hot spot analysis examines clustering of crime reports over time, this analysis method was used to investigate the changing trends in crime patterns from 2013, a year before the program launched, to 2017, the last full year with available crime data. On the other hand, optimized hot spot analysis tool examines the clustering of points in total and does not distinguish between different points in time. This analysis was able to show test crime incidents within each of the five years studied so that it could be apparent in how the crime was changing between the year 2013 and 2017. The result of this study shows a statistically significant reduction in property and drug crimes within 500 feet of sold 2014 Large Lots but not for violent crime. This result is encouraging in terms of the policy implication. A detailed discussion regarding the positive correlation between blight remediation and changes in crime rate and the policy implication of this phenomenon will be provided in detail.

EFFECTS OF EARTHQUAKES ON LANDSLIDE RISK MAP IN SOUTH KOREA

Abstract ID: 729

Poster

YI, Zheongzun [Seoul National University] lcapksy@gmail.com, co-author

KANG, Junsuk [Seoul National University] windkplus@hotmail.com, presenting author

Central theme: Could the Landslide Risk Map in South Korea be more trustful if the earthquakes are considered in the risk analyses as an affecting factor? The landslide risk map in South Korea has been used to conduct reasonable landslide prevention projects. The factors affecting landslides are very diverse, however current landslide risk map is just based on topographical map, forest map, and geology, but earthquake loads associated with detailed soil physical properties have not been considered in the classification of landslide risk grades. The objective of this study is to evaluate the effects of earthquakes in the areas having relatively low risk grades, and develop the design methodology to mitigate potential risk induced by seismic events.

Approach and methodology: Analytical studies are executed using a general purpose finite element software, GTS NX, and Riks method (arc-length method) is adopted to evaluate highly nonlinear effects for both geometry and material of soils. Comparative studies for slope stability would be done using two analytical methods: 1) strength reduction method, and 2) stress analysis method. The 2D plane strain elements are used for soils and Mohr Coulomb, Drucker Prager and Modified Mohr Coulomb models are considered for soil material models.

Findings: The primary findings of this study are as follows:

- Evaluate the effects of earthquakes associated with detailed soil physical properties for landslides in South Korea
- Recommend the revision of Landslide Risk Map in South Korea
- Recommend the design methodology to mitigate the elevated risk of landslides due to earthquakes

Relevance of the work: This work is related to our research projects for landslide risk management in urban metabolism.

LEVERAGING GEOREFERENCED SOCIAL MEDIA INFORMATION TO ANALYZE HUMAN ACTIVITIES AND CARRYING CAPACITY IN ECOTOURISM DEVELOPMENT AND PLANNING

Abstract ID: 1232

Poster

NAM, Yunwoo [University of Nebraska-Lincoln] ynam2@unl.edu, presenting author

Social media information is gaining increased interests of researchers and planners because it complement data sources provided by traditional approach and statistics normally used, deals with a research gap, and provides useful information for practical planning and policy. By analyzing geotagged social media data, researchers can obtain information to identify trends of phenomena.

Ecotourism is an important planning field in which social media information plays a significant role. Many local governments are actively engaging in ecotourism development as an effective strategy to protect natural environment and create economic benefits for local residents. Therefore ecotourism has received lots of attention from environmental planners and economic development policy makers. In designing, managing and marketing ecotourism sites, the role of social media information is increasingly valuable.

The paper identifies attractive ecotourism sites in mid-west region; and analyze tourist activities and carrying capacity using geotagged photo data. We examines the selected ecotourism sites from spatial, temporal, and thematic perspectives. The study area includes Nebraska, Kansas and South Dakota. User generated photos with location based information are obtained from the Flickr and other social media sites. Our analysis explores geographic patterns, intensity, and spatial clusters of data as well as place based characteristics of locations, using spatial statistical methods with GIS. We also analyzes tourist behavior patterns and movement. The paper attempts to shed light on the assessment of carrying capacity and its importance as a management tool in tourism planning and development. Compared with traditional opinion survey, data from geotagged social media provide different ways of analysis with valuable volunteered information. This approach also lowers time, effort and cost. Various studies have used information from photo-sharing services to analyze tourist movements and assess tourism sites. However while the interest in geotagged photo data is increasing, relatively less attention was given to spatial statistical techniques to analyze location patterns. This study provides a novel approach in spatial

planning. It also contributes to the knowledge of ecotourism planning and management, and the advancement of methodology.

TRACK 2 - ECONOMIC DEVELOPMENT

ROUNDTABLE: BUFFALO'S EMERGING INNOVATION ECONOMY

Abstract ID: 104

Roundtable

STEBBINS, Dave [Buffalo Urban Development Corporation] dstebbins@ecidany.com, moderator

BAGCHI-SEN, Sharmistha [University at Buffalo] geosbs@buffalo.edu

ORSI, Christina [University at Buffalo] cporsi@buffalo.edu

For well over 100 years, Buffalo, New York was part of the thriving manufacturing belt in the Great Lakes-Midwestern region of the U.S. However, the regional economy has suffered with the long-term decline of the manufacturing sector. The City of Buffalo, which grew beyond 500K in the 1930-50 period, currently has the population it had in 1890 of about 256K. Like other large cities in the region, the Buffalo economy is restructuring in an attempt to become part of the knowledge economy.

This panel will provide fine-grained insights about the evolution that is taking place in Buffalo and the lead role the University at Buffalo is playing in this evolution. In order to promote entrepreneurship, talent development and business engagement, the University at Buffalo is completing the planning process to create Innovation Districts (IDs) across their campuses.

The panelist will address the following points to inform and engage the audience:

- How the IDs will foster faculty and student engagement with anchor companies as well as promising startups;
- The plan to create vibrant places to foster networking among students, faculty, business people and leaders; and
- The provision of space for this networking and places with housing and urban amenities.

The panelists will also provide contextual information from both the historical and comparative perspectives.

ROUNDTABLE: RETOOLING OUR PEDAGOGY AND PRACTICE IN ECONOMIC DEVELOPMENT PLANNING

Abstract ID: 805

Roundtable

SCHROCK, Greg [Portland State University] gschrock@pdx.edu, moderator

LOWE, Nichola [University of North Carolina] nlowe@email.unc.edu

CAMPBELL, Scott [University of Michigan] sdcamp@umich.edu

FANG, Kerry Li [University of Maryland, College Park] kfang@umd.edu

GANNING, Joanna [Cleveland State University] j.ganning@csuohio.edu

MOOMAW, Suzanne [University of Virginia] swm2x@eservices.virginia.edu

As with other planning subfields, economic development is not immune from the challenge of how best to prepare future practitioners. We have moved from a popular discourse of “urban crisis” to one of “urban triumphalism,” yet uneven development and inequality are as prevalent as ever, and the pace of economic disruption and

restructuring are only increasing. New data sources and analysis tools are continually coming online, yet shift-share analysis and input-output models remain the state of the art. And despite enthusiasm for the “equity turn” in planning, the economic development field of practice remains stubbornly stuck in a world of deal-making and neoliberal consensus, and in many places, planners endure direct attacks on government, public sector learning and adaptive planning. We aspire to show our students that planning matters and better community outcomes are possible, yet our cupboard of instructive case studies is woefully bare.

Simply put, how can we, as economic development planning educators, more effectively use our pedagogy and practice to inspire emerging planners to focus their energies toward more just, equitable and sustainable economies? What works well, what doesn’t and what needs to change?

This panel pulls together economic development educators from various institutions and with varying levels of teaching experience to address these questions.

Panelists will share ideas and resources in support of revitalized pedagogy and practice. Topics include

- Evolving/reframing economic development theory and debate to be more relevant to how local economies are changing;
- Elevating equity and sustainability goals within the field;
- Making the case for good government and public investment;
- Deploying innovative methods or using old methods in innovative ways to analyze local economies;
- Training emerging planners how to use economic development tools most effectively to build power and achieve community goals;
- Using case studies in the classroom, including international case comparisons; and
- Expanding beyond “hard skills” to focus on improved communication and critical, thoughtful public writing.

ROUNDTABLE: THE FUTURE OF (INFORMAL) WORK: DIGITIZATION AND INFORMALIZATION OF URBAN LABOR MARKETS

Abstract ID: 1141

Roundtable

JACKSON, Jason [MIT] jbrj@mit.edu, moderator

QADRI, Rida [MIT] rqadri@mit.edu

DEVLIN, Ryan [John Jay College, CUNY] rdevlin@jjay.cuny.edu

SONG, Lily [Harvard University] lsong@gsd.harvard.edu

GHERTNER, Asher [Rutgers University] a.ghertner@rutgers.edu

Informal labor markets are typically associated with the Global South. Understood as ‘backward’ features of a ‘lagging’ economy and characterized by “non-compliant, non-enforced and deregulated” dynamics (Durst and Wegmann 2017:1), they are conceptualized as the antithesis of technology-intensive production in the developed world. However, with the rise of the On-Demand Economy urban labor markets in the developed world are increasingly mirroring informal labor market practices. Indeed, the fact that the ‘gig economy’ work is organized by large-scale, well-capitalized firms headquartered in the Global North is unsettling taken-for-granted distinctions between formal and informal markets and firms. A contemporaneous trend is the heightened

interaction between ‘modern’ technology-enabled platforms and informal enterprises, whether through labor sourcing platforms which encourage piecemeal wage work, ride hailing apps like Uber that retrofit informal auto-rickshaws and motorbike taxis, or digital payment mechanisms that do away with cash. ‘Formal’ and ‘informal’ organizations are deeply intertwined. The global rise of casualization coupled with the fusion of informal labor markets with new technologies thus necessitates renewed scrutiny of the binaries of informal-formal, South-North, traditional-modern and backward-advanced.

This roundtable will reflect on how the rise of new technologies is reshaping ideas and practices of 'informality'. The discussion is organized around three main questions: First, how do new technologies interact with informal labor market practices? Second, what are the distributional implications of these technological developments for different classes of informal market workers in urban spaces? Third, what are the imperatives for policy-relevant research on urban informality in this period of radical technological development and urban transformation?

While the “Future of Work” features substantially in contemporary discourse, these conversations have largely centred on formal industrial labor contexts. Even though the vast majority of the globe is employed in non-standard or informal occupations, we know little about the implication of new technologies for these types of work. Will they be tools of empowerment, rescuing workers from an ‘exploitative’ unregulated economy or simply ensconce workers in deeper relations of domination? Have these breakthrough technologies increased livelihood generation possibilities or simply increased precarity for labor? The participants of this roundtable bring together their variegated perspectives on urban informality, labour markets and urban political economy to define a new research agenda on emerging technologies and the future of (informal) work.

PRE-ORGANIZED SESSION SUMMARY

THE FUTURE OF NEIGHBORHOOD RETAIL: PROBLEMS AND PROSPECTS IN THE AGE OF AMAZON

Summary ID: 11

Abstract ID: 102

Abstract ID: 1006

Abstract ID: 1279

While small, independent neighborhood retailers provide a host of benefits for local communities – including serving as social hubs and third places, adding to the vitality and activity of the street life, and reducing revenue leakages – they have struggled in recent years, first with the growth of big box retailers, and now with the rise of e-commerce. The purpose of this session is to investigate and discuss the problems and prospects for neighborhood retail in the face of continued technological change. Where are neighborhood retailers surviving or (potentially) thriving, and what about their neighborhood environments are most important? How do design and preservation influence neighborhood retail success? What regulatory or political frameworks can be used to support these types of businesses? Given the interconnected nature of these questions, papers from a variety of perspectives are encouraged, from urban design and preservation to public policy, economic development, and land use planning.

Objectives:

- Better understand problems and prospects for neighborhood retail in the face of continued technological change.

NEIGHBORHOOD RETAIL IN THE AGE OF AMAZON: TRENDS AND CHARACTERISTICS FOR SUCCESS

Abstract ID: 102

CREDIT, Kevin [Michigan State university] creditke@msu.edu, presenting author

Over the past few years, the rise of e-commerce retailers like Amazon have begun to radically change the dynamics of local retail businesses. These changes have significant implications for local economic development and planning, for several reasons: 1) many municipalities rely on commercial sales tax revenues which may or may not be fully recouped through e-commerce activities, 2) communities have often invested large sums for infrastructure and redevelopment around large regional shopping centers and big box stores that may now be at risk for failure, 3) e-commerce inherently exports a significant share of retail revenue out of the local economy.

Given these issues, it is important for planners to understand the extent to which local neighborhood retail is struggling and to examine the characteristics of neighborhoods where retail business creation is still going strong. To do this, this paper analyzes business license data from the City of Chicago's Open Data Portal to ascertain overall trends in new retail business creation from 2002-2016. This data is then joined to block group-level data to better understand the important characteristics of neighborhoods that contain significant hot spots of new retail business activity from 2013-2016, the time period over which all new retail activity in the city dropped significantly (and, perhaps not coincidentally, when Amazon Prime began to reach a critical mass of users).

The results of a multinomial logit model suggest that, among traditional demographic and financial characteristics that predict new business growth, higher access to certain kinds of walkable amenities significantly relates to location in hot spots of new retail business creation. This finding corroborates previous work that suggests urban, walkable amenities are important to business activity (Florida, 2002; Jacobs, 1961; Leinberger and Alfonzo, 2012), and suggests to planners that one potential solution to the struggles of neighborhood retailers is to foster the development of more appealing, walkable environments.

THE ROLE OF URBAN PLANNING RESEARCH IN THE RETAIL REVOLUTION

Abstract ID: 1006

Group Submission: The future of neighborhood retail: problems and prospects in the age of Amazon

KICKERT, Conrad [University of Cincinnati] conrad.kickert@uc.edu, presenting author

This paper presentation connects urban planning and design scholarship to the dynamic field of retail by surveying research and trends in planning and related academic fields, private analysis and consultancy best practice. While retail is a key element of the urban experience (Coleman, 2006; Zukin, 2004), urban planning research suffers from significant knowledge gaps on how the accelerating retail transformation will affect cities. Part of this knowledge gap is attributable to the rapid pace of change in retail, eclipsing the inertia of academic research reliant on research funding acquisitions, rigorous data analysis and peer-reviewed research publications. Furthermore, planning scholarship often relies on longitudinal data sets that are by nature retrospective, clashing with the speculative nature of most retail analytics. Thirdly, much research on retail is situated in fields that urban

planning scholars rarely relate with, like behavioral sciences, distribution and information technology. Finally, a significant amount of retail research is conducted internally by retailers, analytical firms and consultancies, preventing outcomes from entering the public domain.

This disconnect between planning scholarship and retail reality is highly detrimental to the efficacy of future planning interventions in the accelerating transformation of the retail landscape. After decades of moving out of cities, retailers are increasingly moving out of physical locations altogether. As a result, news outlets and real estate analysts are keen to predict an upcoming “retail apocalypse”, extrapolating a revolutionary shift from high-profile retail closures and stock price warnings (Townsend, Surane, Orr, & Cannon, 2017). Indeed, stores are closing at a record pace, with an estimated 147 million square feet of store space shuttered in 2017 alone (Buss, Shuler, Bakshi, & Lee, 2017). As retail rents fall and retailers close, mall operators are facing an uphill battle to remain solvent, accelerating the decline of the American shopping mall that was heralded a decade ago. Online shopping is commonly seen as the culprit of the demise of physical retailers, with the rise of Amazon in the United States and Europe and Alibaba in China increasingly seen as a threat to the current physical retail landscape (Zhang, Zhu, & Ye, 2016). On the other hand, retail is re-urbanizing in the experience economy, with planning and economic development interventions at the forefront of successful retail districts. By surveying the academic and professional status quo and trends in retail, this paper provides planning research directions that inform policies and design interventions to reinvigorate urban retail districts and guide the retail revolution toward more equitable and sustainable cities.

THE DEATH AND LIFE OF MOM AND POP: AN ANALYSIS OF SMALL SCALE RETAIL IN SAN FRANCISCO, CHICAGO AND NEW YORK

Abstract ID: 1279

Group Submission: The future of neighborhood retail: problems and prospects in the age of Amazon

TALen, Emily [University of Chicago] talen@uchicago.edu, presenting author

ANSELIN, Luc [University of Chicago] anselin@uchicago.edu, co-author

FARAH, Irene [University of Chicago] irenef@uchicago.edu, co-author

CREDIT, Kevin [Michigan State University] creditke@msu.edu, co-author

For decades, small-scale, independently owned, neighborhood-serving retail – affectionately termed the “mom and pop” store – has battled for survival against changes in consumer preferences, e-commerce, corporate retailing, and commercial gentrification. Amidst a significant decline in mom and pop retailing, urban planners have sought ways to support them, arguing that there are social, economic, and environmental benefits associated with businesses that are neighborhood-serving, local, and independently-run. Based on these normative ideals, our research seeks to better understand the correlates of mom and pop retail. Our primary research questions are: where do independently owned, neighborhood-serving retailers exist, how stable are they, and what are the predictors of their ability to succeed or fail?

We begin by framing the various ways in which mom and pop retail is valued. One common theme is that the employment generated by small, independently-operated main street businesses is particularly valuable because it provides a role for those left out of the urbanized knowledge economy. Further, independently run neighborhood-

serving businesses provide a measure of sustainability, as owners are thought to be more likely to spend their profits locally, such that resources are recycled in the local economy. Mom and pop stores are believed to be especially responsive to local need. This fosters economic inter-dependence, social interaction and neighborhood stability. Some authors have explored the social and cultural values of neighborhood-based businesses.

Against this framing, we undertake a rigorous empirical investigation of mom and pop retail. Using a large-scale database of retailers in three major cities, we conduct a detailed, space-time analysis of the location and economic activity of four mom and pop neighborhood-serving businesses – small, independently owned grocery stores, bakeries, bookstores and hardware stores. We use the National Establishment Time-Series (NETS) database, which is a longitudinal database of business and non-profit establishments throughout the U.S. that includes data on type of establishment, employment, years active, and industry classification, among other variable. We filter the NETS data by our four neighborhood-serving businesses, and differentiate between ownership type (standalone, branch, or headquarters) and number of employees to determine independent status. We then look for correlates of the stability (or lack of stability) of our four neighborhood-serving businesses in three major metropolitan regions: San Francisco, Chicago, and New York. The explanatory variables we analyze include geographic location, built environment, and social characteristics. Geographic location includes regional location, access to public transit, and distance from downtown. Built environment characteristics pertain to the character of the neighborhood in which the business is located in terms of unit type, vacancies, building age, land use mix and density. Our socio-economic correlates include tenure, family type, poverty rate, social diversity, and race and ethnicity.

Through this analysis we are able to show what the correlates of small scale retailing are, giving planners a better understanding of the various drivers underlying the death and life of mom and pop retail.

PRE-ORGANIZED SESSION SUMMARY

EXPLORING THE IMPACTS OF ROBOTS AND URBAN AUTOMATION ON LOCAL ECONOMIC DEVELOPMENT

Summary ID: 35

Abstract ID: 499

Abstract ID: 500

Abstract ID: 509

Robots and urban automation have the potential to be significant disruptive technologies that change the way cities and their economies will develop in the future, along with opportunities for work, and for improving standards of living and quality of life. In the end, the experience of each city and local economy will be unique and shaped by its initial conditions, and, its response to the diffusion of robots and urban automation. At a minimum, robots and urban automation will affect workforce, land-use, infrastructure, and industrial organization and location. The papers in this session explore a range of economic development issues from employment,

industry, and spatial restructuring, needs for theorizing structural change, and consequences for inequality, stemming from the diffusion of robots and urban automation.

Objectives:

- Identifying robotic and urban automation trends
- Identifying planning implications from disruptive technologies of urban automation
- Identifying theory and research methods with which to study robotics and urban automation impacts

EXPLORING GEOGRAPHIC VARIATIONS IN EDUCATION AND WAGE PREMIUMS RELATED TO ROBOTICS SKILL DEMAND

Abstract ID: 499

Group Submission: Exploring the Impacts of Robots and Urban Automation on Local Economic Development

LEIGH, Nancey Green [Georgia Institute of Technology] nleigh@design.gatech.edu, presenting author

KRAFT, Benjamin [Georgia Institute of Technology] bkraft70@gmail.com, primary author

LEE, Heon Yeong [Georgia Institute of Technology] leehy@gatech.edu, co-author

It has been suggested anecdotally that robots are increasing skill and education requirements for manufacturing workers (Brynjolfsson & McAfee, 2014). However, it has been difficult to determine this empirically because employment data are not disaggregated to a sufficient level to identify robots or robot-related skills. We address this data deficiency by using online job posting data to create a measure that determines the degree to which job advertisements require robotics-related manufacturing skills (Leigh, Kraft, & Lee, 2018). The measure will then be used to estimate whether jobs with different required levels of robotics competency also demonstrate differences in other educational requirements and wages. Finally, because the robotics industry and robotics use has a distinct geography (Leigh & Kraft, 2017), we test whether there are geographic variations to education and wage premiums related to robotics skill demand.

REGIONAL ECONOMIC POLARIZATION AND THE AI-ECONOMY

Abstract ID: 500

Group Submission: Exploring the Impacts of Robots and Urban Automation on Local Economic Development

RENSKI, Henry [University of Massachusetts Amherst] hrenski@larp.umass.edu, presenting author

There has been growing concern that artificial intelligence will soon advance to the point where machines and algorithms could displace a considerable portion of the labor force. Some predict that as many as 40 to 50 percent of present-day jobs are at a serious risk of automation in the foreseeable future (Frey and Osborne 2017, Manyika, Lund et al. 2017). Others offer a more cautious interpretation, emphasizing the limitations of computers in solving unstructured problems, working with new information, and in performing non-routine manual tasks (Levy and Murnane 2013).

There has been little discussion, thus far, of whether and how the anticipated automation of work will have differential impacts in different types of cities. Technological change has long had a variable impact on cities, largely conditioned by regional industrial specializations. However, the impacts of automation and computerization are anticipated to be far more widespread—impacting entire job categories across a wide spectrum of skill sets and industries, as opposed to being contained within a limited number of product markets.

This paper examines the possible spatial ramifications of the anticipated computerization of work among U.S. cities and regions. It matches occupations that are most and least “susceptible” to automation with regional data on occupational employment to measure the possible impact across different cities. I find that the jobs that are most at risk tend to be relatively spatially ubiquitous. That is, they are common to many metropolitan areas where they exist in roughly the same proportion. By contrast, the types of jobs that are least vulnerable to replacement by automation are heavily concentrated. These “safe” jobs tend to locate in places with a strong University presence or in large MSAs that are already leaders in the knowledge economy, such as Boston, Silicon Valley, and Austin.

If current predictions are accurate, the concentration of “AI-safe” jobs coupled with widespread decline in “AI-threatened” jobs will likely lead to the further spatial polarization of the U.S. economy between leading and lagging regions. The paper concludes by discussing the prospects for a renewed role for the federal government in addressing the anticipated growth in regional economic disparities.

DRIVING UP STANDARDS OF LIVING? URBAN AUTOMATION AND THE ILLUSIVE PROMISE OF JOB QUALITY

Abstract ID: 509

Group Submission: Exploring the Impacts of Robots and Urban Automation on Local Economic Development

LOWE, Nichola [University of North Carolina] nlowe@unc.edu, presenting author

Technology offers the potential to improve human life, public safety and protect the environment. But could it simultaneously enhance job quality and thus improve standards of living? Uber—a leading proponent and developer of autonomous vehicle technology—has recently staked its global reputation on this provocative claim. Its ‘good jobs’ thesis pushes against a tide of media pessimism, including predictions that close to 4 million American-based workers that currently drive for a living could permanently lose their jobs. Uber’s counterclaim is that advances in technology will instead free drivers from mundane, arduous and unsafe aspects for their daily work life, allowing them to reclaim wasted hours spent driving to focus on higher-value added activities. For urban taxi, transit and delivery drivers, there is the potential to now use lost driving time to take on greater responsibility for logistics, product care and customer service—and for their employers or clients, there is the corresponding expectation that a reduction in driving-related distractions and accidents will improve product delivery times and produce more consistent and reliable delivery service.

Admittedly, Uber’s claim could be easily dismissed as a simple marketing ploy designed to distract from recent company problems, including evidence of sexual harassment, worker mistreatment and regulatory evasion. But this bold proclamation creates an opportunity for urban planners, practitioners and labor advocates to not only hold them to their word, but intervene in ways that pushes this as the dominant urban technology standard.

This paper advances this claim by asking how and under what conditions can urban automation, starting with the introduction of autonomous vehicles, improve job quality? And related to this, what kinds of institutional interventions might be needed to ensure advances in urban technologies continue to promote job quality standards and also increase access to quality job opportunities?

This paper combines historical cases of industrial automation with recent writings on the development of autonomous vehicles and related ‘disruptive’ technologies to outline three reinforcing steps. First, is the opportunity to increase public awareness that even within this narrow technological space, there are dramatically divergent business models in play. Admittedly some technology entrepreneurs are advancing solutions that will exacerbate widespread job loss and worker displacement. But others treat incumbent worker participation and knowledge sharing as an essential and enduring resource for technology innovation and in the process, they place ‘blue collar’ workers—including those with limited formal education—on par with highly educated technology specialists. Second and related, are institutional interventions that get out in front of technological development, pushing solutions that integrate human and machine power in ways that advance economic opportunities for frontline workers. Third, is a broad ideological reframing of urban innovation, such that technology and labor market solutions are tightly interwoven and jointly advanced and where institutional actors—including labor unions, research universities or mission-driven investors—push for public investments in innovative technologies to generate high rates of public return. By anchoring each of these steps to illustrative examples, the goal of this paper is to inspire urban and regional planners to mediate the process of technology development through strategies in support of inclusive innovation.

THE ECONOMIC GROWTH AND DEVELOPMENT OUTCOMES RELATED TO VIBRANCY: AN EMPIRICAL ANALYSIS OF MAJOR EMPLOYMENT CENTERS IN LARGE U.S. CITIES

Abstract ID: 65

Individual Paper Submission

MALIZIA, Emil [University of North Carolina] malizia@email.unc.edu, presenting author

This paper explores the features of vibrancy in detail and presents the typology used to categorize 90 major employment centers across the U.S. Each center receives a vibrancy score based on urban form-related measures of density/compactness, diversity, connectivity and walkable urban design. Measures of employment, investment, income and poverty indicate the economic outcomes of these centers. The empirical analysis relates vibrancy measured in 2010 to subsequent growth and development usually for the 2010-15 timeframe. The basic hypothesis is that higher levels of vibrancy will lead to stronger subsequent economic outcomes *ceteris paribus*.

HANGING BY A THREAD: THE POST-RECESSION RESILIENCE OF LEGACY REGIONS

Abstract ID: 97

Individual Paper Submission

VAN LEUVEN, Andrew [Ohio State University] vanleuven.3@osu.edu, presenting author

HILL, Ned [The Ohio State University] Edward.Ned.Hill@icloud.com, co-author

Regional labor and housing markets are not all created equal. Some are equipped with the assets to resist economic shocks, while others are challenged in ways that lead to structural decline. In a forthcoming paper, we applied the “legacy city” conceptual framework to the geography of U.S. metropolitan areas, dubbing them legacy regions. In this study, we analyze the impact of the Great Recession on the economic health of various clusters of legacy regions. These regions—defined by their possession of both industrial era assets and post-industrial era challenges—greatly differed in their level of resilience following the close of the recession. We model the impact of legacy regions’ pre-recession industrial structure on their post-recession resilience outcomes, paying special attention to the incidence of what we call ‘path-dependent decline,’ which occurred in regions already experiencing job and/or productivity shrinkage in the years leading up to 2007. Finally, we offer several conclusions regarding structural decline in legacy regions (as opposed to cyclical decline) and the geographic heterogeneity of post-recession regional economic recovery.

WHO SHARES? A NATION-WIDE PROFILE OF PARTICIPATION IN CARSHARING, BIKESHARING, AND OTHER SHARING ECONOMY APPLICATIONS.

Abstract ID: 166

Individual Paper Submission

BOYER, Robert [UNC Charlotte] rboyer1@uncc.edu, presenting author

LELAND, Suzanne [UNC Charlotte] smleland@uncc.edu, co-author

The term ‘sharing economy’ encompasses a range of phenomena, several of which have attracted the attention of urban scholars because they upend conventional producer/consumer relationships, and signal possibilities for addressing economic and environmental issues related to hyper-consumption. Botsman and Rogers (2010, 67–96) identify three categories of collaborative consumption including: 1) product service systems (PSS) that create flexible opportunities for short-term access to products traditionally owned by households to the exclusion of others; 2) redistribution markets that encourage the circulation of otherwise underutilized products among a network of users; and 3) collaborative lifestyles, in which networks of individuals share intangible assets like space, time, and skills, often at the local scale. Other authors offer variations on these categories (e.g. Agyeman et al 2013; Demailly and Novel 2014). Optimistically, the sharing economy could represent a blossoming of social connections severed by neoliberal policies of the past half-century; Multiple authors, however, approach the sharing economy critically, observing that the innovations associated with sharing may serve to exacerbate hyper-consumption and the inequities of global capitalism (Richardson 2015; C. J. Martin 2016, Netter 2016, Jarvis 2017).

Our study asks which demographic, attitudinal, and environmental characteristics best predict participation in

different types of sharing economy applications? Distinguishing which types of individuals subscribe to which types of sharing economy applications may help scholars transcend debates about the relative merits of sharing writ-large, identify the stimuli behind the growth or stagnation of certain types of sharing, and help policy makers tailor their efforts to particular populations. To date, a variety of studies examine the characteristics of sharing economy participants, although most either focus on one type of application, a small number of research subjects, or examine participants of a narrow geographic scope. This study takes advantage of the 2016 Cooperative Congressional Election Study (CCES), which offers a nation-wide representative sample of 1,000 American adults.

We collected data in October 2016, asking respondents whether they had ever used any of the following services (with detailed descriptions of each category): carsharing, bikesharing, couchsurfing, community clothing swaps, community supported agriculture (CSAs), and neighborhood-based household goods sharing (e.g. Neighborgoods). Use of any of these applications is extremely rare nationwide (less than 10 percent affirmative responses, in any category). We regress each of these variables on characteristics like population density of the respondent's ZIP code, respondent age, household income, self-assessed altruism, self-assessed extraversion, presence of children in the household, and homeownership. Using a logit model, we find (provisionally) that different types of characteristics are associated with different types of sharing economy applications. For example, living in a higher density ZIP code is associated significantly and positively with carsharing, bikesharing, couchsurfing, but not significantly with CSAs, neighborgoods, or community clothing swaps. Almost all applications, except CSAs, are associated significantly with younger age, and having children in the household reduces the odds of several applications, but not all. Extraversion appears to be an important predictor for car sharing, clothing swaps, and neighborgoods, but not bikesharing, CSAs, and (surprisingly) couchsurfing. Home ownership seems to have no significant effect on using of sharing economy applications.

The results suggest that different sharing economy applications reach different constituencies, either because of disparities in interest or disparities in accessibility, casting doubt on scholarship that attempts to frame the sharing economy as a singular phenomenon. Certain applications of the 'sharing economy' appear more often in relatively high-density places; whereas population density appears to have no influence on other applications. Certain applications seem to be spurred by extraverted users. Relatively few applications appear to have any association with altruism, despite hypotheses to the contrary.

THE IMPACTS OF ECONOMIC DEVELOPMENT INCENTIVES IN THE MIDWEST

Abstract ID: 177

Individual Paper Submission

DRUCKER, Joshua [University of Illinois at Chicago] jdruck@uic.edu, presenting author

WEBER, Rachel [University of Illinois at Chicago] rachelw@uic.edu, co-author

KIM, Geon [University of Illinois at Chicago] gkim86@uic.edu, co-author

Offering incentives to businesses is one of the oldest and most dominant activities within the practice of economic development. It is also one of the most controversial (LeRoy 2005). The specific circumstances under which incentives contribute positively to the economic well-being of local communities are not well understood (Hicks and LaFaive 2011). This research assesses the impacts of local business incentives used by municipalities within the largest metropolitan areas of three states in the U.S. Midwest.

Our work extends knowledge of the effects of economic development incentives in two ways. First, by building upon previous research conducted by two of the authors (Craft, Drucker, and Weber 2017), we include the influence of municipal fiscal and economic development policy “regimes.” The variation evident in the use of incentives across jurisdictions and types of local governments implies different policymaking decision calculi or assessments of the driving motivations for offering incentives (Calcagno and Hefner 2018); these distinctions are identified or indicated and incorporated into the empirical analyses. Through including this key set of factors that influences the municipal decision to offer incentives (and which also may impact economic outcomes directly), we resolve an important potential omitted variable problem afflicting nearly all previous comparable studies.

Second, we add to the so-far limited empirical evidence that has been generated concerning the impacts of local incentives in the post-Great Recession period. The variation across jurisdictions in the use of incentives in the 2010s reflects not only local decision-making but also differing fiscal capacities and situations of adaptation to the economic conditions brought about by the Great Recession, with some governments pulling back on their use of economic development incentives and others initiating new approaches or instruments to attempt to retain or lure businesses (Warner and Zheng 2013). Similarly, business reactions to local incentives may depend on municipal, industry, or firm-specific circumstances. We construct and contrast distinct municipal-level outcome variables, including employment growth, establishment creation, and relocation, to evaluate the breadth of consequences of local incentive use.

We utilize a unique dataset assembled by combining information on selected incentive types (tax increment financing districts and tax abatements) with socio-economic, geographic, and fiscal characteristics for all municipalities in the several largest Metropolitan Statistical Areas located in Illinois, Wisconsin, and Michigan. These states share similar histories and settings (i.e., heavy manufacturing legacy, slowly growing populations, Republican gubernatorial administrations). We add measures of employment change, establishment formation, and relocation constructed from the establishment-level National Employment Time Series database.

BUSINESS VULNERABILITY IN THE FACE OF NATURAL DISASTERS: THE CASE OF HURRICANE SANDY AND NEW YORK CITY

Abstract ID: 205

Individual Paper Submission

MELTZER, Rachel [The New School] meltzerr@newschool.edu, presenting author
ELLEN, Ingrid [New York University] ingrid.ellen@nyu.edu, co-author

The density of urban areas is what makes them productive, but it is also what makes them particularly vulnerable in the face of natural disasters. This is all the more true as the threat of, and damage from, natural disasters becomes more severe, especially for coastal cities like New York. In this paper, we consider businesses, and small retail businesses in particular, and the nature of their risk and resilience in the context of Hurricane Sandy. Specifically, what share of businesses, and the economic activity that they represent, is vulnerable to extreme flooding? What are the characteristics of the businesses, and the nature of their economic activity, in the areas of highest projected risk, compared to those in areas of lower risk? And did Hurricane Sandy affect the economic activity of these businesses?

To answer these questions, we rely on a combination of several rich micro-datasets on business activity, employment, sales revenues and property characteristics in New York City for years leading up to and following the storm. We overlay these data with spatial information on locally determined evacuation zones to capture pre-storm risk, and then inundation zones that show us exactly where, and to what height, the floodwaters surged. We analyze the differences across these zones in business closures, employment and sales revenues before and immediately following Sandy in order to understand the pre-storm vulnerability of businesses and the very immediate repercussions from Hurricane Sandy.

We find that, before Sandy, more than 25,000 establishments were located in the highest risk evacuation zones and, of those, nearly half were providing critical services, like grocery and drug stores. In addition, a majority of buildings in the higher risk areas are of lower-scale construction, implying that most businesses were likely located on floors closer to ground level. Moreover, the buildings were mostly built prior to any resilient building code standards. As for impacts, we find that they differed depending on the nature of the business. While overall employment did not exhibit any significant declines after Sandy, the retail sector did suffer. And the losses were most acute in areas that experienced surge levels of three feet or more – places where flooding severely disrupted business operations. Looking at data from two years after the storm, we find a 40 percent reduction in retail employment (an average decline of about 8.5 jobs) for the typical neighborhood in these high-surge areas. We do not yet know whether these job losses were driven by business closures or contractions; but, it is likely that they were accompanied by interruptions in community services and in earnings for those formerly employed at the damaged establishments.

Our findings so far offer two important lessons for urban planning and policy. First, there are implications for the city's management of risk. The fact that there were significant job losses in areas designated for evacuation suggests that the actual evacuation response and storm preparation were inadequate in terms of achieving resiliency. Second, communities within the same municipality can suffer very different costs from natural disasters. These findings therefore indicate a need for neighborhood-based planning and localized responses in the face of extreme events.

MOTOYAMA, Yasuyuki [University of Kansas] ym.kauffman@gmail.com, presenting author

There have been a number of ways that state and local governments can promote economic development. Most traditionally, government can pursue the industrial recruitment strategy by providing subsidies, tax abatements, low-interest loans in order to influence business location choices (Lester et al. 2014). The 1980s witnessed a new era in which many governments promoted high-tech programs and the 'entrepreneurial' policy through export assistance, venture capitals, incubators and science parks (Eisinger 1988). Alternatively, government can build scientific capacity by educating STEM oriented workforce and extending university outreach to local industries (Feldman et al. 2014). The common theme in all these approaches is their focus on government 'programs.' This makes sense because programs are explicit forms of government actions with (usually) clear goals, which allows evaluation of them. Most economic development scholars in urban planning used programs and policy synonymously, or, to certain extent, assumed that there is no economic development policy if there is no program that is related to economic development.

In this paper, I propose that economic development policy has other different dimensions, which can be as important as programs, and use the case of entrepreneurship promotion efforts with examples from Kansas City MO-KS, Chattanooga TN, and Brookings ND. Recent literature emphasized the importance of experimental learning through peer entrepreneurs and mentorship through experienced entrepreneurs, and such experimental learning takes place most effectively at the local level (Feld 2012). This creates a fertile ground for local government to promote entrepreneurship because, while lacking financial resources and authorities compared to state government, local governments have natural advantages to this locally grounded networks and learning mechanism. Particularly, a mayor can be an important hub and promoter of such networks because, due to the nature of the election process, she is one of the best connected people in town, and she can, first, directly connect otherwise disconnected entrepreneurs to entrepreneurs' meetings and support organizations.

Local entrepreneurship support organizations play important roles to train and connect entrepreneurs (Motoyama and Knowlton 2016). While many of these organizations have their own connections to other support organizations, they are often non-profit and small, tend to be operating in their own small circles, occupied with the operation of their programs, and do not have a broader regional view of the entrepreneurship ecosystem. Thus, an alternative role by a mayor can be to coordinate local entrepreneurship support organizations.

Neither this connecting nor coordinating function falls into formal government programs, but they are the areas that key local government officials can act immediately and effectively. Though the evaluation of these connecting or coordinating functions will be challenging, economic development scholars should pay more attention to non-program functions and roles that local government and key officials can play.

UNPACKING LOGISTICS CLUSTERS

Abstract ID: 259

Individual Paper Submission

CAMPO, Matthew [Rutgers University] mcampo@ejb.rutgers.edu, presenting author

Growing e-commerce firms and global value chains have dispersed transportation and warehousing functions from urban cores to hinterlands (Dablanc & Ross, 2012). While social and environmental costs exist, 'logistics cluster' related strategies endure as a popular focus of economic development (Sheffi, 2012). However, economic development officials' definitions of related industries that comprise clusters can be imprecise, contributing to information asymmetry between firms, economic development officials, and the public (Duranton, 2011). Similarly varied definitions of the industries that comprise the logistics cluster can contribute to confusion, muddling economic development officials' planning approaches and obscuring potential benefits and costs to their constituent communities. Herein, I examine how different definitions of logistics related industries, at varied geographic scales, can affect how economic development officials perceive changes in the growth and volatility of a logistics cluster.

For this research, I define historic trends in the concentration of logistics industries for Core Based Statistical Areas (CBSAs) in the continental United States from 1996 through 2015. Using establishment and employment data from the U.S. Census Bureau, and the Bureau of Labor Statistics, I test how different definitions of the logistics cluster affect the perceived presence of growth and volatility trends using a time-series analysis. My analysis compares industry definitions starting with the warehousing sector (Dablanc & Ross, 2012), broadening to the transportation and warehousing sectors (Rivera et al., 2014), and finally to extensive e-commerce related sectors (Delgado et al., 2016). The results suggest differences in the trajectory and volatility of change in CBSA location quotients when using different component industries to represent logistics clusters.

However, economic developers plan for industry at the local, regional, and national geographic scales. Using multivariate statistical techniques, I examine differences in establishment and employment concentration at the county level within CBSAs. My results suggest differences in industry and employment change and volatility within regions. In some CBSAs, change and volatility are more unevenly distributed among constituent counties. Additionally, I find differences in the volatility of change among constituent counties when compared to the overall CBSA trend. Taken together, the results suggest that localities may not always benefit evenly, nor steadily, from regional planning efforts and subsequent changes in industry concentration.

In this analysis, I describe systematic differences among definitions used to convey cluster based target policies at the regional level. In addition, I find inconsistency among measures of growth trends and volatility between CBSAs and their constituent counties. For planners, these findings demonstrate the importance of industry definition and scale when assessing the social, environmental, and economic benefits and costs of cluster-based economic development planning initiatives. If industry definitions and scales are inconsistent within and among regions, economic development officials' approaches to assessing benefits and costs may be flawed. Analyses using varied geographic scales and cluster definitions can mitigate against information asymmetry to help economic developers more thoughtfully assess potential investment strategies, as well as address concerns from the general public.

POLITICAL CULTURE AS A DEFINING FACTOR: THE LIMITS OF ECONOMIC PLANNING IN CHICAGO AND LONDON

Abstract ID: 281

Individual Paper Submission

KRAUSHAAR, Robert [SUNY System Administration] rkraushaar20@gmail.com, presenting author

Nations and communities possess attributes which are a function of place, historical development, economic rationale and social composition. These attributes cause a political culture to form which is a major influence in any consideration of a wide range of alternatives – both alternative definitions of a perceived problem and alternative solutions once the problem has been defined. The process by which this takes place has been termed “nondecision making” by Bachrach and Baratz.^[i] They define it as “...the practice of limiting the scope of actual decision-making to ‘safe’ issues by manipulating the dominant community values, myths, and political institutions and procedures.”^[ii] Political systems and sub-systems develop a ‘mobilization of bias,’ a set of predominant values, beliefs, rituals and institutional procedures (“rules of the game”) that operate systematically and consistently to constrain the range of possible policy choices.^[iii]

The political culture reacts as a constraint by suffocating unacceptable policies before they are even voiced; or keeps them covert; or kills them before they gain acceptance, or, failing all of these things, maims or destroys them in the implementation stages of the policy making process. Any proposal conflicting with the dominant political culture runs the risk of being outside the ‘scope of legitimacy’ and may either “receive no serious attention or will be used to discredit the person or organization that proposes it.”^[iv]

Political culture, in other words, restricts the actions themselves, the way one goes about achieving a given ends, as well as the interpretation of the end itself. The main aspects of a political structure, as identified by McCallum,^[v] are attitudes toward authority, social stratification, society and change, and economic ideology.

During the 1980s, progressive planners in London and Chicago, as well in other cities in both countries, sought to redefine how their local governments would develop policies that benefitted local residents more than private capital^[vi] While each had similar overall goals, the policies and programs that were developed in each city differed, in part, because of different political cultures in England and the U.S. Simply put, the ideology of the Labour Party in England allowed the London planners more political space within which to frame and implement their policies.

ASSESSING THE BLUE ECONOMY IN THE GREAT LAKES REGION: A CLUSTER APPROACH

Abstract ID: 434

Individual Paper Submission

LEMA, Eva [Central Michigan University] lema1e@cmich.edu, presenting author

TORRES, Jose [Central Michigan University] torre5j@cmich.edu, co-author

GRAZIANO, Marcello [Central Michigan University] grazi1m@cmich.edu, co-author

In recent years, many coastal areas have reassessed the value of marine and coastal industries, establishing strategies for development and conservation, and considering the ocean as a source of growth. Subsequently, several researchers have explored the ocean, maritime and more recently the Blue-generated economic activity in Europe (see e.g. Morrissey and O'Donaghue, 2012;), North America (e.g. Colgan et al. 2013, Doloreux et al., 2016) as well as in rising Asian economies (Ding et al., 2014).

In this study, we examine blue industrial clusters in the watershed region of the eight states across the Great Lakes in order to assess their level of economic activity in industries related to the marine environment and natural resources generated from the Lakes. We use a cluster approach, which focuses on collecting and presenting data for interconnected industries that are meaningful based on the definition of the Blue Economy clusters (Ketels and Protsiv, 2016). Our analysis includes not only traditional marine-related sectors such as maritime transportation and logistics, fishing, and tourism but also, energy generation, environmental services, mining, and manufacturing in sectors that make use of marine resources.

Our aim is to assess the current status of the clusters, opportunities that are emerging for them, and the role that these clusters could play towards a transition to a Blue Economy. For this reason, we present indicators such as employment, Gross Regional Product, Labor Productivity and Location Quotient, we highlight the regional averages and compare them to the averages at the national level. In a region as unique and with a lengthy inland coastline as the Great Lakes these indicators have significant impact on the welfare of localities and individuals, and identifying the strong comparative advantages of the region can further help inform regional planning decisions, whether in determining future land use, guiding future workforce specialization, or overall re-directing resources to the regional economy.

The findings to date suggest that the eight states present specific specializations with high differences in the GRP and the shares of employment across the eight states. This is especially true in the case of the city of Chicago in Illinois as well as in Michigan where the level of economic activity is supported by both vast metropolitan areas, which allows them a more uniform development across the different sectors and clusters. In terms of employment, most of the clusters had an increase in jobs in the last years. Potentially, and given the strategic role of this region and its resource base, there are several pathways for future development, particularly within the realm of renewable energy technologies and blue-biotechnology products. Understanding the Blue Economy can further assist on how to approach these pathways for future development.

CLEANING OFF THE RUST IN THE RUSTBELT: RECLAIMING THE MANUFACTURING NEIGHBORHOOD

Abstract ID: 439

Individual Paper Submission

COFFIN, Sarah [Saint Louis University] sarah.coffin@slu.edu, primary author

HENSON, Luke [Saint Louis University] luke.henson@slu.edu, presenting author

Recent industrial land studies have provided constructive insights into urban manufacturing ecosystems and the infrastructure that supports them (Dempwolf 2010, Howland 2010, Leigh & Hoelzel 2012, Chapple 2014, Lester, Kaza et al. 2014). These analyses range from parcel inventories designed to assess patterns of land use change (Dempwolf 2010, Howland 2010, Leigh & Hoelzel 2012) to detailed statistical models of the relationship between industrial land conversion and neighborhood real estate market dynamics (Chapple 2014, Lester, Kaza et al. 2014) and have advanced the policy discussion in useful and important ways. A series of questions remain that explore potential policy solutions that further characterize current and future land uses as economic development strategies. First, what are the specific conditions related to industrial land redevelopment and how might that translate to potential firm displacement? Is there a varied response in vacant versus continuously-occupied industrial sites? Second, what might those implications be for locations with a large surplus of vacant industrial land? Is there the potential for re-introducing manufacturing on brownfield sites in urban core areas? Using a combined database of vacant and redeveloped industrial sites in St Louis Missouri, this paper will examine the relationship between neighborhood real estate dynamics and industrial redevelopment outcomes. By combining building permit and tax parcel data between 2008 and 2018, we will be able isolate industrial uses by level of investment (using permit data) and differentiate between the redevelopment of vacant versus occupied sites (using parcel data). With this analysis we will explore the factors leading to industrial redevelopment and whether redevelopment patterns suggest a re-emerging potential for manufacturing neighborhoods or whether we are witnessing an emerging pattern of industrial gentrification.

SHRINKING LOCAL AUTONOMY: MONEY, POWER, AND THE ROLE OF THE SUBNATIONAL STATE

Abstract ID: 463

Individual Paper Submission

KIM, Yunji [University of Wisconsin-Madison] ykim535@wisc.edu, presenting author

WARNER, Mildred [Cornell University] mew15@cornell.edu, co-author

Fiscal federalism argues for a decentralized governance system based on claims of efficiency and effectiveness wherein higher scales of government assume redistributive functions and lower scales assume development functions. However, since the Great Recession, research finds local governments increasingly assuming redistributive responsibilities that crowd out their developmental role (Xu and Warner 2016). Moreover, rising

levels of fiscal stress at the state level encourage states to engage in a process of scalar dumping that pushes down costs and blame to the local level (Peck 2014). Reflecting these recent changes, theories of state rescaling see a more dynamic process of movement in state power across scales that does not necessarily guarantee more efficiency or democracy. What does state rescaling look like in the post-Great Recession context of austerity (Hinkley 2017) and what is driving this process?

We use 2002, 2007, 2012 US Census of Government Finance data to track finance trends for the period immediately prior to and after the Great Recession. We use reports from the National Association of Counties (NACo), National League of Cities (NLC), National Conference of State Legislatures (NCSL), media reports, and three focus groups we held with local government associations to explore US state rescaling in revenue and policy authority and expenditure responsibilities.

We find expenditure responsibilities (especially for social welfare) are shifting to the state and local level, while local revenue tools and policy authority are being preempted. This decoupling of responsibility and power is cracking the foundations of fiscal federalism. We find evidence of a corporate-state legislator coalition (supported by the American Legislative Exchange Council) that is preempting local authority to make laws to promote economic justice (minimum wage, wage theft, paid leave), regulate the new economy (Uber, AirBnB), protect the environment (plastic bag bans), and protect human rights (Sanctuary cities and anti-discrimination bills). Cities' roles as economic development engines and spaces of progressive social movements (Doussard 2015) may be at risk. Political geographers have argued that local governments have become "austerity machines" (Peck 2014). We argue instead that the austerity coalition is found at the state level. Corporate interests more easily penetrate the state legislature, which is often part time, to make laws that would not pass at the national or local levels. While most local governments are using pragmatic municipalism to maintain their public roles (Kim and Warner 2016), we find limited potential for local pushback against the austerity coalition of corporate interests and state legislators.

Our findings have implications for planners who work on economic development and social justice. We argue scholars should give more attention to the subnational state, as this middle tier is the weak link and a critical fulcrum between national and local policy.

EXCESS COMMUTING IN LOW-WAGE LABOR MARKETS: INVESTIGATING HOME-JOB PROXIMITY AMONG LOW-EARNING WORKERS IN FOUR METROPOLITAN REGIONS

Abstract ID: 478

Individual Paper Submission

WOLF-POWERS, Anna Laura [Hunter College, City University of New York] aw2416@hunter.cuny.edu, presenting author

NELSON, Marla [University of New Orleans] mnelson@uno.edu, primary author

The LEHD Origin-Destination Employment Statistics (LODES) dataset, made available through a partnership between the Census Bureau and state governments, enables researchers to investigate journey-to-work

information on a much more granular level than was possible in the past. The new database, which combines commute flow information with data on both workers and the jobs they hold, presents the opportunity to explore long-standing theories about how the spatial structure of U.S. metro regions impacts employment access for low-earning workers.

For years, equity-focused planners worked from evidence developed by Kain (1992) and others which suggested that the decentralization of jobs had created a “spatial mismatch” between low-wage workers residing in central cities and appropriately skilled jobs. Subsequent to this research, however, regional employment patterns became more polycentric, with concentrations of jobs emerging outside of the “downtown/suburban” dichotomy. Population distribution within metro areas also changed, with more low-earning workers residing in suburban and exurban locations than in the past. While this might seem to bode well for increased access to close-to-home employment for low earners, there is evidence that increasing polycentricism is related to measurable increases in “excess commuting” – workers working in jobs far from where they live even when they reside in close proximity to concentrations of jobs that would require shorter commutes (Nelson, Wolf-Powers, & Fisch, 2015; Yang, 2008). [1] This finding problematizes the assumption that physical proximity to appropriate jobs conditions low-wage workers’ job-seeking behavior, and raises a number of policy-relevant questions about the relationship between residential location and job match for these workers.

This paper investigates the phenomenon of “excess commuting” in four regions: Albuquerque, NM; Atlanta, GA; New Orleans, LA; and Philadelphia, PA. The study regions were selected based upon Kneebone and Holmes’ (2015) examination of commute distances in the 96 largest metropolitan areas. One region was selected from each of the commute distance quartiles. Within each region, we utilize 2015 LEHD LODES data to identify and classify employment centers; calculate low-wage workers’ distances and commute times to their jobs in these employment centers; and determine levels of excess commuting. We address three questions:

- How do the commute distances of low-, middle- and high-wage earners differ from region to region, and to what factors might we attribute these differences?
- How do low-wage employment centers differ in terms of industry mix, commuting flows and proximity to public transportation networks and affordable housing options, as compared with employment centers containing more high-wage jobs?
- What are the potential policy implications of excess commuting, if it exists, for practitioners whose goal is to improve the economic conditions and social mobility of low-wage earners?

As commute distances increase for all workers (Kneebone & Holmes, 2015), placing low-cost housing in proximity to places where demand for less skilled workers is high continues to be a significant anti-poverty strategy. Planners have long sought to promote the construction of affordable housing near urban and suburban job centers. (Cervero, 1989). The concept of a jobs-housing balance or, more recently, ‘jobs-housing fit’ describes the extent to which the character and affordability of housing units in an area are well matched to the quality of locally available jobs. But the phenomenon of excess commuting suggests that different interventions may be called for. This investigation, by evaluating the prevalence of excess commuting, sets the stage for a qualitative study that attempts to understand factors other than physical proximity that may condition low-wage workers’ job-seeking behavior, and to develop interventions based on that understanding.

[1] Excess commuting is measured/defined as the difference between the observed amount of commuting and a theoretical minimum amount of commuting suggested by the job–housing relationship.

FROM HUMAN CAPITAL TO HUMAN CAPABILITIES: PLACING PEOPLE AT THE CENTER OF ECONOMIC DEVELOPMENT

Abstract ID: 479

Individual Paper Submission

DOUSSARD, Marc [University of Illinois at Urbana-Champaign] mdouss1@illinois.edu, presenting author

In principle, the idea of human capital supplies a much-needed alternative to the limited conceptual repertoire of economic base theory (Mathur 1999). Non-finite and non-rival human capital should offer cities a means of escape from the desultory competition for scarce manufacturing investment. In practice, however, human capital-focused economic development suffers from the same practical limitations and restraints as development programs rooted in economic base theory (Feldman et al. 2016). Rather than change the practice of inter-urban competition, today's cities leave the practice of zero-sum competition minimally changed – they simply compete for a limited supply of mobile professionals rather than manufacturing facilities.

These limitations result from the constraints of human capital theory itself. Robert Lucas originally devised the human capital metaphor to argue that human skill could function as a market commodity (Lucas 1988). The resulting emphasis on cities “buying” the market commodity of skill, rather than “making” their own by investing in education and social services results from Lucas's strategically limited definition of human skill. As an alternative, my paper explores the application of human development theory to both the practice of economic development and to the signature challenges today's urban economies face. Rooted in the work of Amartya Sen (1999), human capital theory focuses on individuals' drive to improve their skills, expand the resources available to their households, and plan for the long-term. Sen usefully ties this theory to the accounting mechanism of capabilities – skills, resources and relationships that allow humans to maximize their potential over the long-term.

I provide two illustrations of human development theory's potential contributions to economic development thought and practice. First, I show the human development ideas figure centrally in successful campaigns for municipal economic policy reforms, such as \$15 minimum wages, fair scheduling ordinances, earned sick time legislation, free or reduced-cost community college, and universal pre-kindergarten care (Doussard and Lesniewski 2017). These once-unthinkable policy measures all advance on the back of arguments that reframe economic redistribution as support to individuals' efforts to invest in their own futures. Second, I explore the application of human development theory to explain the growth of Fort Collins, Colorado and Asheville, North Carolina -- urban areas that draw substantial in-migration and feature buoyant growth despite the absence of conventional propulsive industries. These regions, and dozens of others like them, compensate for the absence of traditional exporting industries by offering affordable housing, local consumption opportunities, public anchor institutions and natural amenities (Markusen and Schrock 2009). Charting these features in terms of capabilities recasts the growth of Asheville, Fort Collins and similar places as a systematic response to changes in economy and society, rather than confusing exceptions to economic rules. The paper concludes by identifying other issues – including the gig economy, the maker movement, fiscal austerity and financialization – human development theory can help to illuminate.

TARGETED HIRE POLICIES IN US CITIES: WHO IS ADOPTING THEM, HOW AND WHY?

Abstract ID: 482

Individual Paper Submission

SCHROCK, Greg [Portland State University] gschrock@pdx.edu, presenting author

In recent years there has been a re-engagement of local governments in the United States with policies designed to promote equitable and inclusive development. One of these areas is “Targeted Hire” policies, which obligate private-sector employers receiving public contracts or development incentives to take affirmative steps intended to increase employment opportunities for disadvantaged populations, particularly workers of color. These take a variety of forms, including “first source” or “local hire” requirements, and apply across a range of job-creating activities from construction to retail. These progressive policies have waxed and waned over the years (Schrock 2015) as elected officials have negotiated political and legal opposition from business and suburban interests on one side, and pressure from activists and community organizations on the other.

Although there is a small but growing literature documenting this latest wave of policies (Douthat and Leigh 2017), there is no comprehensive inventory of which U.S. cities are adopting Targeted Hire policies, and how and why they are doing so. This paper presents results from a scan and survey of the 100 largest U.S. cities, which shows a patchwork of different approaches adopted by cities. In some cities these policies exist “in name only,” meaning that government agencies expend little energy and few resources ensuring employer compliance; while a much smaller number have dedicated staff and resources to their programs. Also variable across cities is the degree of transparency and external accountability to community stakeholders over process and result, and alignment with existing local workforce development infrastructure. In general, Targeted Hire policies are more common in cities experiencing new development activity (i.e., strong market conditions), and those with high levels of racial disparity in employment outcomes. A small number of cities – especially in the South – have pursued such programs in the past, only to see state governments pre-empt their authority to do so.

In addition to these survey results, this paper compares the experience of three U.S. cities that recently adopted or strengthened their Targeted Hire programs: Baltimore, Denver, and New Orleans. In particular, it assesses the role of external actors in motivating adoption and impacting implementation of the policies. In each case, non-governmental actors were important, but in varied ways. In Denver, activist coalitions were critical in pressuring local officials to strengthen existing policies that were considered weak and ineffectual; in Baltimore and New Orleans, foundations played a critical role in providing resources and legitimacy to actors promoting targeted hire policies. In cities robustly adopting Targeted Hire policies, however, external and internal actors play complementary roles in ensuring that local elected officials remain committed to the program.

These findings reinforce the idea that credible commitments to more just and equitable planning and development are unlikely to occur without a push from outside actors (Clavel 2010; Schrock, Bassett, and Green 2015; Doussard 2015). But especially with programs like Targeted Hire that require robust implementation in order to succeed, supportive planners and agency officials are necessary to the process as well.

URBAN NEIGHBORHOOD UPGRADING AND BUSINESS DYNAMICS: RECENT EVIDENCE FROM LOS ANGELES

Abstract ID: 497

Individual Paper Submission

TONG, Xin [University of California Irvine] txin1@uci.edu, presenting author

KIM, Jae Hong [University of California Irvine] jaehk6@uci.edu, co-author

Urban neighborhood upgrading has taken place at an increasing rate almost everywhere: from London to New York, from Los Angeles to Shanghai, and decades of research has focused on its (possible) impacts on local residents, particularly those who are vulnerable to soaring housing costs. With much attention being paid to residential displacement (as a consequence of contemporary neighborhood upgrading), the dynamics of businesses are not as much involved in this scholarly conversation. Consequently, little is known about how the business landscape in urban areas is reshaped by recent neighborhood upgrading or the so-called gentrification.

This study provides an empirical investigation of the changing patterns of retail stores in the City of Los Angeles from 2000 to 2010 in relation to urban neighborhood upgrading. Unlike previous studies that have focused primarily on one side of the change, explicit attention is paid to both business closures and new businesses openings with the extensive use of the ReferenceUSA dataset (geocoded) that provides detailed information about individual business establishments in the study area. This is accomplished by employing accelerated failure time models (for business closures) and Poisson count models (for new business openings) to reveal the distinct patterns of two-sided business dynamics in rapidly changing urban neighborhoods and the factors that contribute to these dynamics. A comprehensive set of sensitivity analysis is also conducted to examine how the results vary along with the type of neighborhood upgrading and inclusion/exclusion of some (neighborhood-level) control variables.

The results show that the impacts of neighborhood upgrading varied substantially across the 12 sub-categories of retailers considered. More specifically, on the one side, urban neighborhood upgrading tended to be more influential on the survival length of some sub-categories of retailers, such as building material and garden equipment and supplies dealers. In the cases of food and beverage stores and clothing and clothing accessories stores, however, the impact of neighborhood upgrading on the length of survival depended on the types of neighborhood upgrading examined. On the other side, neighborhood upgrading was associated with a greater number of new businesses entering into the neighborhood for most types of retailers, suggesting that it can create opportunities for a range of economic activities. The location of businesses also appeared to matter; for instance, businesses that were closer to the CBD or farther from transit stations were likely to experience a higher turnover rate. Furthermore, for all types of retailers, new businesses tended to be located within the neighborhoods where the same-type, larger, and/or older retailers were concentrated in 2000.

THE CHANGING NATURE AND QUALITY OF NON-STANDARD EMPLOYMENT

Abstract ID: 532

Individual Paper Submission

LIU, Cathy [Georgia State University] cylu@gsu.edu, presenting author

NAZARENO, Luisa [Georgia State University] luisa.nazareno@gmail.com, co-author

Institutional changes, such as globalization and markets liberalization in the 1970s, led to an internal reorganization of enterprises' business models, with direct consequences to employment relations. Weil (2014) describes the current scenario as a "fissuring workplace", in which big enterprises tend to shed employment to a fiercely competitive network of smaller business units, while setting strict standard controls for their performance. In addition to institutional factors, the composition of the workforce itself contributed to a growing polarization between "good and bad jobs", and to a change in the traditional psychological and social contracts between employees and employers (Kalleberg 2011). In this context, the resurgence of the interest on non-standard employment is justified by the perception that the trend has sharpened recently, in part due to new technologies (Abraham et al. 2017).

So far, the consequences of this changing nature of employment are mixed. The concern about quality of new employment arrangements is central to the discussion, but measuring it is somewhat challenging given the multidimensional and subjective nature of the concept. Such job quality change effects are not expected to affect all population groups to the same extent. Minority and immigrant populations are more likely to be part of the non-standard workforce as they are particularly concentrated in low-skilled jobs, as thus tend to be more vulnerable to precarity and segregation (Kalleberg 2011; Kalleberg, Reskin, and Hudson 2000; Catanzarite 2000). However, as my previous findings indicate, there are important distinctions within those groups as well across different types of alternative arrangements, skill levels, and industry sectors (Liu and Kolenda 2012). So far there is lack of literature that specifically examines these two population groups and their representation in the non-standard and contingent workforce, variation within the groups, and job quality premium or penalty associated with their participation in this emerging employment arrangement.

This paper seeks to fill this void by providing systematic analysis of minority and immigrant non-standard workers in comparison both to other non-standard white and native-born workers as well as in comparison to standard workers with comparable skills. We are also interested in how these job quality differentials change over time. We use data from the 2005 Contingent Worker Supplement (CWS) to Current Population Survey (CPS), and the Contingent Work Survey 2015, conducted by Rand Corporation as part of Rand American Life Panel Survey (RPCWS). While ideally we would like to use the new CWS supplement of 2017, its scheduled release date of spring 2018 is not yet confirmed. RPCWS bears much similarity to and can thus serve as a credible alternative (Katz and Krueger 2016, 2017). older) who worked in the previous week, comprising. We adopt the definition of alternative employment proposed by Polivka (1996), which includes workers "whose employment is arranged through an employment intermediary, such as temporary help firm, or individuals whose place, time, and quantity of work are potentially unpredictable". For the quality of employment indicators, we include total payments, multiplicity of jobs, number of hours worked weekly, expectations in terms of the future, among others. Descriptive analysis and regression analysis will be performed to gauge the changing quality of employment associated with non-standard work arrangement for minority and immigrant workers with different skill levels. We expect that negative effects associated to alternative arrangements to be stronger for low-skilled workers.

THE CONTRIBUTION OF CIVIC AND CULTURAL AMENITIES TO THE HEALTH OF DOWNTOWNS

Abstract ID: 578

Individual Paper Submission

BURAYIDI, Michael [Ball State University] maburayidi@bsu.edu, presenting author

This paper examines the significance of civic and cultural amenities to the health of downtowns. Across the US there is considerable angst and debate about the relocation of civic and cultural amenities from downtowns. Whether this involves courthouses, jails, county and city offices, libraries, or museums, the issue is always the same. How will the relocation of the civic use impact the downtown? The relocation of these facilities from downtowns to the fringe has become necessary in the last two decades because of the need for increased space to accommodate a growing inmate population, increased criminal justice workloads in courthouses or a desire to consolidate municipal and county services; space that is either unavailable downtown or available at a high cost. Because there is no research or hard data to guide policy makers, the decision has always been contentious, with proponents and opponents using anecdotal data to argue their case.

In Albemarle County, VA, county officials are considering the relocation of the county courts to a new location outside the historic Courthouse Square, while in Augusta County, VA, residents voted by a margin of 2-1 to keep the courthouse in downtown Staunton. The Davidson County, TN sheriff's office is considering closing the jail located in downtown Nashville and moving it to Antioch, so the county can consolidate all sheriff offices at the new location. Lucas County Commissioners in Ohio announced the relocation of prison facilities from a downtown location to Angola Road, a location outside downtown Toledo. The 650-bed jail is estimated to cost \$145 million and will be funded with a property tax levy of 1.08 mills.

While few studies exist that link the health of downtowns to civic and cultural uses, research by the University of Wisconsin-Extension of twenty cities of similar population size in Wisconsin found that cities with county government seats had 8.4% more businesses in their downtowns than those without a county seat. The downtowns of cities with county seats had more retail businesses, more professional service businesses, and an overall greater mix of businesses than those that did not have a county seat.

This paper extends this research by analyzing civic and cultural amenities in downtowns of a sample of small and mid-sized cities (defined as settlements between 20,000 and 100,000 residents) across the US. The research will document and analyze the relationship between the number and types of civic and cultural amenities in these downtowns and the economic health of the downtowns. Quantitative and qualitative data will be used to establish the relationship including for example, the number and mix of retail businesses, sales volume of retail businesses and restaurants, longevity of downtown businesses, number of visitors to downtown facilities, etc. Network analysis will also be used to establish the functional relationships between civic and cultural uses and other uses in the downtown. The findings from this study will be useful to city officials, civic leaders, and downtown managers as they contemplate the location and expansion of civic and cultural amenities and will support decision making and public policy on these matters.

SPATIAL HETEROGENEITY IN SPILLOVER EFFECTS OF BUSINESS IMPROVEMENT DISTRICTS

Abstract ID: 579

Individual Paper Submission

NOH, Youngre [Texas A&M University] yrnoh@tamu.edu, presenting author

In recent decades, some of the municipalities found across the U.S. have had challenges while attempting to provide sufficient public services due to diminishing revenue and the rising costs of these services. Thus, the inadequate public services and the decline of local economic development opportunities can be identified as the reason for the current dilapidation witnessed in commercial areas. In response, the Business Improvement District (BID), a private initiative supported by the public sectors, has been commonly adopted as a tool to revitalize the commercial areas in cash-strapped cities (Meltzer, 2012). With the introduction of BIDs, property and business owners are expected to pay an additional assessment fee which is used to facilitate the provision of public services such as cleaning the streets, providing security, initiating capital improvements, enhancing streetscape, and developing a positive public image for the area. In essence, the owners of commercial properties through the payments are investing in the improvement of the neighborhood quality which is aimed at attracting potential consumers and investors through the program. Considering the fact that BIDs are available only in prescribed commercial areas, the previous literature regarding this topic have been majorly focused on the impact of BIDs on the value of commercial properties (Ellen et al., 2007) and crime reduction (Calanog, 2006) within their borders (Meltzer, 2012).). Regarding attributed effects of BIDs, previous literature has also addressed the impact of crime (Hoyt, 2005; Calanog, 2006; Brooks, 2008), municipal finances (Brooks and Meltzer, 2010) and commercial properties (Ellen et al., 2007; Meltzer, 2012), however, the impact of BIDs on the neighboring residential areas have been overlooked.

In this study, our objective is to examine the spatial-temporal spillover effects of BIDs on the value of properties in the neighborhood beyond their service boundaries in the city of Los Angeles. Our particular goal is to examine and compare the impact in the different neighborhoods based on their varying income levels. In addition, the impact on the different housing types such as the single-family housing and the multi-family housing units have been analyzed. To evaluate the spatial-temporal spillover effect, we used the Adjusted Interrupted Time Series Difference in Differences (AITS DID) models. The outcome of our studies will be useful to planners, residents and local governments who seek to understand the heterogeneous nature of the spillover effects regarding the BIDs programs. From the results, private and public sectors will have a better comprehension regarding the adoption of BIDs and the potential impact on the neighborhoods with different income levels. Planners will find the information helpful in developing policies targeted at establishing social and economic balance in the concerned communities.

INTERREGIONAL VIRTUAL WATER TRADING: IMPLICATIONS FOR REGIONAL ECONOMIC DEVELOPMENT UNDER CLIMATE CHANGE

Abstract ID: 589

Individual Paper Submission

BHATIA, Manraj [California State University, Northridge] mbhatia.csun@gmail.com, presenting author
GULDMANN, Jean-Michel [Ohio State University] guldmann.1@osu.edu, co-author

With the backdrop of finite fresh water resources, increasingly water-stressed regions, and the resulting consequences of insufficient water on future development, it is important to understand the concept of virtual water flows and incorporate it into economic planning. Knowledge about the virtual-water flows entering and leaving a country or region can cast a completely new light on the actual water scarcity of the country or the particular region. Using this concept, studies have shown that there are no countries/regions in the world where the pattern of trade does not influence the pattern of domestic water use.

This paper uses the Commodity Flow Survey (CFS) data for 1997, 2002, and 2007, and over 43 commodity groups, to understand the corresponding virtual water flows across the 51 U.S. states (including Washington D.C.). Virtual water flows represent the water embodied in produced and traded goods, and may have important regional economic development implications in the context of climate change and the resulting new patterns of water availability.

Water input coefficients have been used to convert commodity flows into virtual water flows and to estimate the amount of water used in the production of each commodity and each state. The only recent study estimating sectoral water use is by Blackhurst et al. (2010) (BHV), which has been used to estimate the water input coefficients for all CFS commodity in this study. The BHV study presents water coefficients in Million Gallons of water per dollar of output with the base year of 2002. As expected, the water coefficient of agricultural products is the highest, followed by Chemical products and preparation. Next, these coefficients are used to compute the virtual water flows by commodity and across states.

The net water flows by commodities and across states are found to vary substantially over the three survey years (1997, 2002, 2007) and for different commodities. An interesting trading pattern is observed. States such as California, Florida, Oregon, South Dakota and Tennessee are consistently high importers of virtual water, whereas Louisiana, Texas and Virginia are consistently high exporters. States like Arizona, Connecticut, Indiana, Ohio and Wyoming go from being importers in 1997 and 2002 to exporters in 2007, while other states like Kentucky, Mississippi, New Jersey, New York and Utah go from being exporters in 1997 to importers in 2007.

It is also interesting to note the pattern of flows across the three survey years. In many cases the flows are much larger in 2002 than in the other two years. A probable cause for this marked change is the drought that hit the western U.S., extending eastward to the Midwest and also the Southeast. States such as California and Florida had to import more water-intensive products to meet their demands, while other states, like Texas and Virginia, were on the exporting end. It can be seen from these results that climatic impacts, such as drought, tilt the scales, forcing some states to import more while forcing others to export more to satisfy demands within the U.S. As a result, these decade-long data provide some insights into the possibly high vulnerability of commodity exchanges and regional economies to climatic changes.

THE EFFECTS ON THE LOCAL ECONOMY OF 'SANCTUARY CITY' POLICIES

Abstract ID: 592

Individual Paper Submission

PARK, In Kwon [University of Seoul] ikpark@uos.ac.kr, presenting author

VON RABENAU, Burkhard [Ohio State University] vrabenau@qn.net, co-author

The debate about so-called 'sanctuary city' policies is hot. A local government's failure to cooperate with the federal government's crackdown on illegal immigrants may have several effects. Some relate to crime and community safety (Gonzalez, Collingwood, & El-Khatib, 2017), while others impact local economies in terms of local wages, income, employment, unemployment, and poverty. Given that research shows that immigration and ethnic diversity have positive effects on economic performance (Eraydin, Tasan-Kok, & Vranken, 2010; Thomas & Darnton, 2006), sanctuary policies can do through their effect on diversity, and indeed, this may be the reason why some local governments have adopted these policies. In this study, we try to estimate the effect of sanctuary policies on the local economy.

Sanctuary policies are relatively new and their impact has not yet been rigorously analyzed due to lack of data. Studies that deal with the subject typically divide cities into two groups, sanctuary and non-sanctuary cities, matching the two to control for factors such as population size and immigrant share, and then estimate the difference between the two groups. (Woong, 2017). However, this method cannot fully control for all fixed effects of sanctuary cities; it cannot correct for endogeneity problems; and it cannot study trends and lagged effects over time. To deal with these problems, we introduce a panel model using longitudinal US county data on sanctuary policies and economic performance. A unique dataset on the adoption and implementation of various types of sanctuary policies comes from the Immigrant Legal Resource Center's FOIA (Freedom of Information Act) request and data on local economic performance come from the Bureau of Economic Analysis and American Community Survey.

The main findings expected from the analysis are as follows: First, sanctuary policies will affect resident wages and income for two reasons. First, they contribute to labor diversity, hence stimulating innovation and market expansion. Second, they promote trust between residents and local government, stabilize the status of immigrant workers, and thereby eliminate uncertainty. Next, the rates of poverty and unemployment may be affected temporarily, though fleetingly. Sanctuary policies reduce barriers to labor mobility, which in turn may increase the influx of migrant labor and raise poverty and unemployment rates. This effect, however, will be temporary, as the local economy finds its new equilibrium over time and these effects disappear.

City planners and development economists should consider the results. Regions adopting sanctuary policies may be able to look forward to a greater expansion of the economy than may otherwise exist, but must also supply the necessary infrastructure and plan for a housing supply that accommodates ethnic diversity.

UNFOLDING CITY BRANDING STRATEGIES: EVIDENCE FROM THE CITY OF DALLAS

Abstract ID: 595

Individual Paper Submission

BONAKDAR, Ahmad [University of Texas, Arlington] ahmad.bonakdar@mavs.uta.edu, presenting author
AUDIRAC, Ivonne [University of Texas, Arlington] , co-author

City branding has recently gained much attention in the planning literature, as a competitive strategy for local governments to project a positive image of their jurisdictions, hoping to attract business investment and promote economic growth (Ashworth & Kavaratzis, 2009). Anchored in neoliberal policies, the growth paradigm (Logan & Molotch, 1987), and urban entrepreneurialism (Harvey, 1989), city branding draws on cultural projects, signature architecture, event spectacles, and recent strategies including urban greening and diversity to foster economic development. Particularly, cultural projects and art industries have often served as potential catalysts for realizing the creative economy (Grodach, 2017; Scott, 2000)

This paper examines the role of city branding strategies that have recently manifested in the City of Dallas, located in Dallas-Fort Worth (DFW) region, one of the booming economic regions in the United States. Dallas has started a diverse range of initiatives for strengthening its economic development and undergirding its mission to achieve a distinguished and powerful position. While this research investigates what city branding strategies Dallas has initiated and implemented, it identifies the implications of such strategies for local communities.

This research purposefully selects Dallas, as a rising mid-sized city with the potential for becoming a highly productive and entrepreneurial city, among the top economically influential cities in the United States. The data for this study comes principally from two sources. First, primary data include personal semi-structured interviews with local officials and branding agents such as marketing developers in Dallas. The selection of participants for interview is primarily based on a snowball sampling approach. Secondary data comprise official and archival reports, statistics, and extant literature. Given the qualitative nature of this research, it draws on the triangulation of data to facilitate a deeper understanding of city branding strategies still underway in Dallas.

The findings demonstrate that Dallas has particularly relied on a series of transformative strategies to overhaul its image and identity, boosting its economic growth. First, the development of cultural flagship projects has contributed to what has become one of the largest cultural precinct in North America, the Dallas Arts District. Second, Dallas has employed the use of architectural edifices including the development of three costly bridges (designed by the famed architect, Santiago Calatrava) as a part of Trinity River Project. Finally, the investment in communication media has facilitated the projection of a positive image of Dallas.

While the findings draw attention to the entrepreneurial role of Dallas in attracting potential businesses and tourists, they resonate with the broader implications of city branding for local communities, including limited citizen participation, the commodification of urban space and promoting the city image sanitized from undesirable realities such as poverty. While branding agents benefit from local government's support, they need to consider the social equity challenge as to how the outcomes of city branding practice accrue not only to external audience but also to local residents.

WHATEVER HAPPENED TO ITINERANT VENDORS? EVALUATING EQUITY AND VIABILITY OF FOOD HALLS IN SINGAPORE

Abstract ID: 670

Individual Paper Submission

QADRI, Rida [MIT] rqadri@mit.edu, presenting author

One of the key features of natural markets is their mobility. With low set-up costs and a modular structure, traders can assemble and disassemble in response to cycles of local demand. These characteristics also allow vendors to locate in underserved areas, where traditional retail cannot or will not. Yet, an increasingly popular city response to street vending is moving traders to certain fixed locations such as within food halls. One of the most (allegedly) successful example of such planning policies comes from Singapore, where beginning in 1970 all vendors were moved to large ‘hawker centers’ - a cross between food court and covered public market. The claim of the Singaporean government was that the new setup would provide all the service delivery benefits brought about by itinerant vending within a controlled, ordered, regulated space. Numerous cities in the Global South have eagerly adopted Singapore’s model, creating their own versions of hawker centers. The pinnacle of their global relevance came in 2010 when, claiming inspiration from Singapore’s hawker centers, celebrity chef Anthony Bourdain announced a 150,000 sqft food hall in New York.

Yet, there is little empirical research on whether food halls can deliver the responsive, equitable and stable ecosystems natural markets have been seen to create. Using Singapore as a case study, this paper comments on the tensions and trade-offs that can occur when cities fix itinerant vendors in space, constraining their mobility. It evaluates Singapore hawker centers on two metrics: equity and economic viability.

To assess socio-spatial equity, various accessibility measures are computed, relying on a fine-grained, parcel-level synthetic population dataset of the 4million+ Singaporean residents. While Singapore performs well on measures of income-based vertical equity, results show certain populations like foreign workers are significantly disadvantaged vis-à-vis access to the centers. Since foreign workers were a key market of previously itinerant vendors, this outcome points to the serious challenges created when states force vendors to trade from predetermined locations.

Economic viability is tested by leveraging real estate data to create measures of rent, vacancy and turnover. Through this analysis a considerable spatially discriminating economic performance gradient across the centers was discovered. For instance, rents at the most expensive centers were approximately 600% higher than rents at cheaper centers, while prices were almost undifferentiated. If this pattern continues with no ameliorating policies, small-scale, independent vendors may soon get priced out of the enterprise.

In light of these results, this paper puts forth three propositions, which can be used to evaluate urban planning interventions in informal economies. First, any initiative which sweeps vendors of the street has to consider alternative service delivery mechanisms to marginal populations. Second, if the government wishes to support

local entrepreneurship through vendor markets it needs a more spatially nuanced and locally targeted policy. Third, innovative planning approaches to sidewalk vending are needed which leverage and build upon its flexibility. As more cities seek to constrain a naturally modular, mobile and valuable form of retail, this reflection takes on global relevance.

DISPLACEMENT AND REPLACEMENT OF RETAIL BUSINESS BY ENVIRONMENTAL GENTRIFICATION: THE CASE OF SEOUL, KOREA

Abstract ID: 677

Individual Paper Submission

KIM, Jeongseob [Ulsan National Institute of Science and Technology] jskim14@unist.ac.kr, presenting author
PARK, Juhyeon [Ulsan National Institute of Science and Technology] juhyeon92@unist.ac.kr, co-author
OH, Jihoon [Ulsan National Institute of Science and Technology] wlgnsl414@unist.ac.kr, co-author

Urban green space plays an important role in providing citizens with recreation opportunities and amenities. It could also contribute to revitalizing neighborhoods when the green space improves the image of disadvantaged communities and attracts people like the case of High Line Park, New York. Environmental gentrification could be defined as the mechanism by which opening of a new park or a green space works as a trigger for gentrification. From a neighborhood small business perspective, urban green spaces could lead to drastic change in retail business: opening of new entrepreneurial retail capital—boutiques, trendy restaurants, and café as well as the replacement of local retail store and services.

This study introduces recent policy efforts of Seoul City to make the city greener such as Cheongye Stream Restoration, Seoul-Ro, Gyeongui Line and Gyeongchun Line projects. Then, from the perspective of environmental gentrification, this research explores the outcomes of the urban greening projects using the case of Gyeongui Line Forest Park.

Gyeongui Line, which had been underutilized railways, was converted into a linear urban park three miles long and 10 to 60 meters wide. The neighborhoods near Gyeongui Line have been in the process of gentrification, and the opening of Gyeongui Line Forest Park has accelerated and expanded gentrification. In order to explore the environmental gentrification mechanism, this study analyzes the trajectories of retail business before and after the opening of the park. Spatial and temporal characteristics of retail business are analyzed based on the birth and death information of the various small business. The analysis for the trajectories of retail business confirms that displacement of retail services for residences was promoted by the opening of the park. Land use change from residential to commercial use has been increased by the opening of the park. Further, the opening of the Gyeongui Line increased new entrepreneurial retail business. The results and findings of this study provide a better understanding of neighborhood change from the environmental gentrification perspective.

POST-RECESSION ECONOMIC DEVELOPMENT POLICY: CITY FISCAL SPACE, STATE POLITICS, AND LOCAL AGENCY

Abstract ID: 687

Individual Paper Submission

HINKLEY, Sara [University of California, Berkeley] hinkley@berkeley.edu, presenting author
WEBER, Rachel [University of Illinois at Chicago] rachelw@uic.edu, co-author

The Great Recession left its mark on cities in many arenas of policy and politics. In addition to cuts in social programs and public safety, government programs conventionally considered less vulnerable to austerity and budget cuts, including subsidies for private development, were also significantly affected. Using a comparative case study approach, we examine how economic development policy and practice evolved in six U.S. cities over the recession and recovery. Our cases—Boston, Fresno, Las Vegas, Milwaukee, Minneapolis, and Oakland—were sampled to provide a diverse range of economic and fiscal conditions before and after the Great Recession.

We measure and explore the reasons for changes in incentive use through in-depth interviews with policy makers and watchdogs and documentation of fiscal, economic, and policy trends in these cities over the post-recessionary period. We find that changes in economic development strategy are in large part motivated by the contraction of a city's fiscal policy space – their ability to adjust sources of revenue, including borrowing (see Warner and Zheng, 2013). This fiscal constraint, however, was not the only force shaping municipal economic development policy. We argue that new policy regimes and relationships have come into being as a result of the crisis and that these interact with other trends in economic development practice (see Reese, 2014 and Lester et al, 2014).

As a result of these regimes, the economic development function of local government appears to have been weakened, as reflected in the elimination of city-controlled redevelopment agencies, declines in state revenue support, and regulatory restrictions. Our evidence provides a counter-narrative to those claiming that a “new municipalism” has increased the role of cities as economic actors. The role of state governments in shaping both economic development strategy and the toolbox of economic development policies (including incentives) was strengthened in the wake of the Great Recession, making it important to understand the economic development frameworks operating at the state level (Hanley and Douglass, 2014). The reformulation of economic development by local officials, however, reveals austerity as a complex top-down and bottom-up process (Davidson and Kutz 2015) and confirms other findings that the local is an important site for understanding how institutional actors adapt in periods of disruption and uncertainty (see Pike et al, 2015).

WHERE ARE INNOVATION SPACES IN BEIJING? A MIXED LOGIT MODEL TO ESTIMATE INNOVATION SPACE LOCATION CHOICE

Abstract ID: 766

Individual Paper Submission

ZHENG, Siqi [Massachusetts Institute of Technology] sqzheng@mit.edu, presenting author
DU, Rui [Massachusetts Institute of Technology] durui@mit.edu, co-author

China has witnessed exceptional firm birth rates and a booming trend of entrepreneurship over the last three decades. In particular, the great volume of entrepreneurship, accompanied by steady capital market growth, has led to a recent surge in the development of innovation spaces (e.g. co-working spaces, incubators, makerspaces, and accelerators). Despite the growing literature on the geography of entrepreneurship in China (Zheng and Zhao, 2017), little attention has been given to how spatial distributions of innovation spaces are formed.

Using a unique dataset of innovation spaces in Beijing, this paper develops a mixed logit model (Brownstone and Train, 1999) to estimate the location choices of innovation spaces at a high spatial resolution (1 km × 1 km grid cell level). We consider three major forces that shape the spatial distribution of innovation spaces.

First, we calculate the supply of affordable rental housing using subway travel time as a weight, and estimate the impact of grid-level access to affordable rental housing on how innovative spaces are spatially distributed. Our results confirm that subway networks facilitate young entrepreneurs' access to affordable rental housing, and promote the separation of workplace and residence in order to realize economies of scale.

Second, our results show that the location choice of innovation spaces is causally associated with the availability of urban consumer amenities, for which we use the number and the diversity of restaurants and coffee shops as well as community walkability as proxies. We are able to produce causal estimates by instrumenting consumer amenities with historical road networks in Beijing. The result is consistent with an extensive literature on urban consumer amenities (Glaeser et al., 2001).

Third, we find that innovation spaces tend to cluster in areas with higher land availability for either residential housing or office buildings, which may lead to lower living and business costs. Following Zheng et al. (2014), we use the relocation of state-owned enterprises (SOE) at the beginning of SOE reform as an instrumental variable for land availability. The historical SOE relocation gives us a plausible source of exogenous variation to address the endogeneity issue.

Further analysis suggests that innovation spaces are drawn to the locations with higher concentrations of incumbent firms, universities, and research institutions, corroborating our hypothesis that agglomeration forces and knowledge spillovers are at work (Delgado et al., 2010). Using data on the vacancy rate of innovation spaces, we try to understand whether space resources in Beijing are misallocated.

Our study sheds light on the formation of innovation spaces in China, and provides insights into how innovation spaces respond to the location preferences of startups by providing agglomeration benefits and low-cost entry opportunities for small businesses. The rapid growth of entrepreneurial activity came at a time when the Chinese central government was launching the Mass Entrepreneurship and Innovation initiative, which poses new challenges for urban planning and is especially relevant for innovation spaces. Our study points to the importance of policymakers thoroughly investigating the underlying determinants of the innovation space location choice when instituting urban planning policies. Such policies should facilitate a city structure that is conducive to agglomeration economies and reduce the misallocation of space, human capital, and capital resources.

EXAMINING THE SOCIOECONOMIC IMPACTS OF WIND POWER DEVELOPMENT ON RURAL AREAS: A FOCUS ON EMPIRICAL FINDINGS

Abstract ID: 800

Individual Paper Submission

SHOEIB, Eman [university of Massachusettes Amherst] eshoeib@larp.umass.edu, presenting author
RENSKI, Henry [University of Massachusettes Amherst] hrenski@larp.umass.edu, co-author
HAMIN, Elisabeth [University of Massachusettes Amherst] emhamin@larp.umass.edu, co-author

Wind power development has rapidly expanded in the United States. Much of this growth occurred in rural areas because of the availability of land and wind resources to power turbines. The economic promise of wind power projects is particularly appealing for rural areas whose traditional economic base (typically manufacturing or agriculture) no longer support as many household as it once did. Numerous studies have found that wind power projects have positive economic impacts on rural areas. What is less well understood is the impact of these wind power farms on other indicators of development, such as municipal finance, demographic change, and quality of life. This article reviews the literature on the socioeconomic impacts of wind projects in the United States and the relationship between these impacts and rural development, broadly defined. Given the complexity of distinguishing between economic growth and development, most studies find a strong association between wind power projects and economic growth in rural counties measured by an increase in personal income, employment rate, tax base, and school local revenue. However, the consequence of this economic growth did not investigate yet; more research is needed to determine how wind power benefits quality of life and other dimensions of development. We recommend using different measurements and methods to find the net impacts of wind power development on rural development.

PATH-BREAKING OR PATH-DEPENDENT? HOW DID SPECIAL ECONOMIC ZONES INFLUENCE INDUSTRIAL TRANSFORMATION OF CHINESE CITIES

Abstract ID: 829

Individual Paper Submission

ZHENG, Siqi [Massachusetts Institute of Technology] sqzheng@mit.edu, primary author
LI, Yingcheng [Massachusetts Institute of Technology] lych@mit.edu, presenting author

Industrial planning is a key component of China's urban and regional planning systems. Over the last three decades, special economic zones (SEZs, or "kaifagu") have become one of the most important place-based industrial planning policies. It has been reported that China has so far constructed 552 national-level SEZs and 1,991 provincial-level SEZs. Whereas the significant roles of SEZs in promoting China's economic growth and urbanization process have been documented in many studies (Zheng et al., 2017), relatively little attention has been paid to investigating how SEZs have influenced industrial transformation of Chinese cities. With the decentralization process of China's economy, Chinese local governments have gained more power and freedom in choosing their own industrial development modes. In this context, SEZs have been often regarded as a key place-based industrial planning policy to prioritize development of specific industries for which a given city may or may not have comparative advantages. Compared with other non-prioritized industries, however, these prioritized industries usually get more preferential incentives and are therefore expected to have faster growth rate.

From an evolutionary economic geography perspective, industrial development is usually characterized by path dependence and path breaking, depending on the extent to which new industries are related with existing industries in a given city. In this study, we investigate how SEZs would influence path-dependent and path-breaking development of industries in Chinese cities. To that end, we draw upon the Chinese Manufacturing Business Performance Database which covers detailed performance information (i.e., gross output, employment) of all the Chinese state-owned enterprises and non-state-owned enterprises above designated size from 1998-2008. During this study period, China had undergone an unprecedented economic growth rate and the number of SEZs had also increased significantly. We first calculate each city's location quotients of 191 manufacturing industries which are classified according to China's national three-digit industry codes. Based on the results of location quotients, we can identify industries with comparative advantages and those without comparative advantages for a given city at a given time point. We then calculate the relatedness of each pairs of manufacturing industries. Here the relatedness of industries could be attributed to the similarity of technology base, the sharing of labor force, and the spillover of knowledge. In addition to the impacts of SEZs upon which we mainly focus, we also control for other social, economic, and political factors.

The Probit regression results first confirm the research findings of existing studies that industrial development has been mainly characterized by path-dependence (Zhu et al., 2017; Pinheiro et al., 2018). In other words, a given city is more likely to maintain or develop industries with comparative advantages which are highly related with existing industries in this city. Regarding the impacts of SEZs, it is found that industries with comparative advantages are more likely to survive when they are prioritized in a city's SEZs. Other things being equal, industries without comparative advantages are more likely to develop comparative advantages when these industries are prioritized in a city's SEZs. Both findings have shown significant roles played by SEZs in maintaining and developing comparative advantages of industries, justifying the effectiveness of this place-based industrial planning policy for the rapid industrial development of Chinese cities. Our findings could also help urban planners identify the "right" industries for a city or SEZ at a given time point and the "right" conditions upon which certain industries could survive and succeed in a given city.

A STRUCTURAL-RELATIONAL APPROACH TO ECONOMIC RESILIENCE OF KOREAN INDUSTRIAL CITIES IN JEOPARDY

Abstract ID: 834

Individual Paper Submission

SHIM, Hanbyul [Seoul National University] vheerk@gmail.com, presenting author

Economic resilience to recessionary shock has become an urgent social issue of several industrial cities in Korea, such as Gunsan from where General Motors withdrawal and Geoje where shipbuilding yards are closed. Although the evolutionary concept of economic resilience is useful to interpret developmental phases of those cities posteriorly, it implies little relevant policy implications to local actors who are the political stakeholders including central/local government, laborers, local firms, and citizens of the cities but 'adaptation' which means their deprivation and resorting to external aid. With the cases of Korean manufacturing industrial cities, this study examines the notion of economic resilience in terms of economic structure and global/local production network. Below are the questions regarding to policy implications that this study propounds.

A. What are the cause of changes called 'impact' and global/local structural attributes conveying impact to the cities?

B. What is substantive risk in the view point of subject who suffers from the recession?

C. How can the notion of economic resilience be re-defined in structural-relational approach?

D. What are the policy issues the local government take into consideration in terms of structural aspect?

The study traces 20-year change of seven industrial cities in Korea focusing on fluctuations in aggregated amount of production activities and employment by industries, and the developmental trajectory of industrial space in the cities regarding government industrial park projects and spatial plans anticipating investment of global corporations. The analysis includes the delineation about what are the substantive changes to the subjects who take their own response to the impact with the field study in Gunsan and Geoje where decline is ongoing.

The analysis found that: first, the cause is related to topology of production network across in global/local scale and industrial composition of the city which can be categorized into structural attributes of economic resilience. Second, the benefit and damage accompanied by the recession process is distributed unevenly among the stakeholders via spatial fix during developmental process and via hierarchy among laborers. Third, the risk actually is seeded and embedded not only into the economic structure but also spatial structure in in developing process. This implies that local government policy needs a strategic 'coupling-decoupling' approach to the institutional configuration of industrial space.

HOW DOES URBAN GREENWAY PROJECTS AFFECT LOCAL ECONOMIES WITH VARYING CHARACTERISTICS? AN ANALYSIS OF HETEROGENEOUS EFFECTS OF ATLANTA BELTLINE ON LOCAL ECONOMIC PERFORMANCE

Abstract ID: 840

Individual Paper Submission

CHOI, Yunkyung [Georgia Institute of Technology] yunkyung.choi@gatech.edu, presenting author
LEE, Heonyeong [Georgia Institute of Technology] leehy@gatech.edu, co-author
LEE, Yongsung [Georgia Institute of Technology] yongsung.lee@gatech.edu, co-author
GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@design.gatech.edu, co-author

There have been growing concerns over the loss of green space in cities, and its implications on ecosystem services, public health, and the quality of life. In response, an increasing number of cities take initiatives to develop urban greenways that connect local communities through parks, natural amenities, pedestrian trails, and bike paths. Although studies document economic, ecological, psychological, and public health benefits of such efforts, how these benefits are distributed between communities still remains unanswered. To be specific, only few studies explore the economic performance of various communities in response to urban greenway projects. As an in-depth case study, this study examines the effects of an urban greenway project on various measures of economic performance and reveals the factors accounting for spatial variations in the performance measures. Atlanta BeltLine is an urban greenway project, which has drawn a national attention for its bold vision, rapid growth as a popular recreational venue, and concerns over equity. It converts a former railway corridor around the core of Atlanta, GA, to a series of connected parks, trails, and bike paths. Its multi-phase implementation, which spans almost over two decades from 2013 to 2030, allows researchers to analyze its impacts on varying types of local economies by the comparison of treated and control areas: i.e., communities with its portion of the project implemented and their equivalent counterparts waiting for implementation in next phases.

This study analyzes an establishment-level rich data set of InfoGroup, which contains information on individual businesses in the project area from 2003 to 2016. With the data set, this study employs multilevel models to investigate the effects of establishment- and neighborhood-level characteristics on the economic performance of various types of businesses. In doing so, this study focuses on three types of economic performance: entry/survival/exit of individual firms, changes in the size of employment, and changes in the composition of various industries. The multilevel models estimate the economic effects of the urban greenway project and its interactions with community characteristics. Our preliminary analysis shows that Atlanta BeltLine has positive effects on local economies in surrounding areas: e.g., we find strong employment growth and increased entries of new businesses to those neighborhoods within a half-mile from Atlanta BeltLine. However, we also observe that the BeltLine development imposes a large pressure on existing businesses to adapt to the changing environment. We speculate that rapid changes in the industrial composition make old and small establishments particularly vulnerable to such industrial restructuring process. This study suggests that planners should consider the uneven benefits of urban greenway projects across varying local economic players.

REVISITING THE ONE HILL DISTRICT CBA IN PITTSBURGH: WHAT ARE THE BENEFITS TO THE COMMUNITY?

Abstract ID: 848

Individual Paper Submission

LAST, Athena [Syracuse University] alast16@syr.edu, presenting author

Historically, marginalized urban communities have been severely impacted by top-down economic development in or bordering their communities, often resulting in such negative outcomes as displacement, gentrification, and destruction. Politically, the fabric of local communities has come unraveled from development projects, which grant limited or no involvement in the decision-making and implementation process. Due to past failure to involve residents in the designing, monitoring and evaluation of projects, CBAs were created as a tool or a mechanism to reverse this and ensure that residents receive incremental benefits from proposed projects (Patterson et al. 2017). More recently, CBAs have come into sharp public focus due to demands for such an agreement by a coalition of Chicago organizations with the Obama Foundation, City of Chicago, and University of Chicago, regarding the proposed Obama Library. This high-profile, unfolding drama makes a broader examination of this issue particularly urgent at this time.

My own study focuses on a case study of a CBA in Pittsburgh, Pennsylvania. For decades, Pittsburgh has seen increasing economic development and gentrification, which has displaced and marginalized poor communities and prompted the negotiation of one of a handful of CBAs existing nation-wide (Lucas-Darby 2012; Salkin and Lavine 2007). The One Hill District CBA serves as an important case study for the purpose of determining whether CBAs continue to perpetuate neoliberal policies by accommodating a “technocratic compromise” that places private sector and government interests over public needs. In the proposed study, I expand on Redwood and Laing’s research (2012) exploring the ability to implement and enforce a CBA in a city that has experienced negative economic and social effects from deindustrialization, such as high unemployment, shrinking population size, hypersegregation, and increased poverty especially among people of color.

In this paper, I provide a preliminary exploration and analysis of in-depth, semi-structured interviews with members of coalition groups and government officials involved with negotiating and implementing the One Hill District CBA, along with community members who are affected by related development outcomes to date. My analysis will include an assessment of the use of the CBA as a tool to deliver environmental and social justice to communities impacted by urban redevelopment and deindustrialization. To make such an assessment, I will expand on the framework of “environmental gentrification” proposed by Checker (2011) to engage and complicate the problematic of social justice in an urban setting.

U.S. STATE CLEAN ENERGY POLICY AND INNOVATIVE TECHNOLOGY ADOPTION: ANALYZING IMPACTS OF ENERGY-BASED ECONOMIC DEVELOPMENT

Abstract ID: 881

Individual Paper Submission

KIM, Gyungwon [Georgia Institute of Technology] joykim@gatech.edu, presenting author

Nations, states, cities, and towns are increasingly concerned about resilient and sustainable development against climate change. Energy-based economic development (EBED) has become a growing field of practice and research in the United States as well as across the world. EBED, a term recently coined by Carley et al. (2011; 2014), reflects the emerging convergence of two disciplines: energy planning and economic development. EBED captures the integration of policy-driven transformations of energy systems for low-emission and efficient energy generation and regional concerns for economic competitiveness and resilience.

Meanwhile, Hurricane Sandy and other catastrophic blackouts have strengthened the demand to secure energy systems during weather-related or human-induced disruptions. Distributed generation (DG) systems have received renewed interests because of the growing demand for resilient power supplies, low- or zero-carbon energy generation, economic and regulatory environment changes, and advances in DG technology efficiency with declining life-cycle costs (U.S. Department of Energy, 2017). Among various technology options for DG, this research focuses on a combined heat and power (CHP) system that is a mature and innovative DG technology promising efficient production of energy on site. However, the CHP deployment is challenged by financial, regulatory, and workforce barriers. To fill the gap between private and public interests, federal, state, and local policy-makers have implemented incentive-based and/or regulatory policies, which aim to promote EBED.

This research began from recognizing the lack of theoretical approaches and empirical analyses in current EBED strategies, and raised a question: How does clean energy policy affect clean energy use and job creation? I assume that consumers are more likely to adopt CHP where the state government provides a number of clean energy policy instruments. To test the hypothesis, this research finds two relationships—1) state governments' activities on clean energy policy entrepreneurship and firms' adoption of CHP technology, and 2) state governments' activities on clean energy policy entrepreneurship and the growth of relevant employment opportunities.

I develop an empirical method to address the influence of state clean energy policies on technology adoption and job creation. I first identify types of state policy instruments, and score states by the intensity of policy implementations. Using a framework of types of environmental policy instruments defined by Goulder and Parry (2008), I characterize the state clean energy policies by selective criteria, including the first year of policy enactment and the range of eligible CHP technologies. Second, I investigate regional differentiations of CHP generation by state and by year. The data of new CHP installations are collected in two forms: in capacity (kilowatt) and in the number of new CHP units. I also collected private-sector employment data by state and by year. Third, I find a relationship in two groups. The first group aims to examine the policy impacts on CHP technology adoption. The second group aims to examine the policy impacts on job generation. FE regression models are employed to analyze panel data by controlling for all time-invariant differences, such as geographic location, political system etc. To control non-policy conditions, time-varying variables are added to the models to

explain energy market conditions (electricity generation by fuel and fuel prices) and economic characteristics (personal income per capita and CO₂ emission). A panel data set for the 50 states and Washington D.C. with a time period from 1980 to 2015 is created for the FE regression analyses.

I extend the existing literature by developing a theoretical framework to converge two fields—economic development planning and energy planning. Within this framework, I demonstrate how EBED is embedded in reality, how firms act along with clean energy policies, and why energy efficiency and clean energy could be a source of economic development.

EXPLORING THE U.S. GEOGRAPHY OF HIGH-TECH ZONES, WHAT POLICIES MADE THE TOP 10 SUPERIOR?

Abstract ID: 920

Individual Paper Submission

ZANDIATASHBAR, Ahoura [University of Texas at Arlington-College of Architecture Planning and Public Affairs (CAPPA)] ahoura.zandiatashbar@mavs.uta.edu, presenting author

HAMIDI, Shima [University of Texas, Arlington] shima.hamidi@uta.edu, co-author

Since 1980s, the geography of innovation and regional innovation systems played major roles in the transition to knowledge-based economy in both the U.S. and developed countries. Much of the current literature in this subject pays particular attention to the formation of innovation clusters and their impact on planning and economic developments (Audretsch & Feldman, 1996; Hamidi & Zandiatashbar, 2018). While innovation is the key, the fact that high-tech industries generate innovation and also catalyze innovation in other firms make them equally or even more impactful on changing the momentum in the cities as well as the surrounding regions (Shearmur, 2010). In this work, we draw upon the seminal works on geography of innovation and provide a new perspective by defining geography of high-tech zones.

In phase 1, we identify the U.S. high-tech zones in 374 U.S. Metropolitan Statistical Areas (MSAs) as clusters of high density employment in high-tech sectors. The high-tech sectors comprise the industries relying on technology research and development (R&D) and STEM (science, technology, engineering, and math) workers. We borrow and apply Brookings' definition of high-tech sectors in this study (Muro et. al, 2015). We retrieve data for the high-tech employees from 2016 ESRI Business Data Source which provides the 8 digit NAICS code, employment size and sales volume for every individual firm in the U.S. We use the local spatial autocorrelation statistics (local Getis-Ord G_i^* statistic) for each block group in the MSA. This approach has been widely used in the research exploring the employment sub-centers (Hajrasouliha & Hamidi, 2017). Then applying a set of criteria we exclude unqualified block group candidates. Our criteria stem from the literature that emphasizes the role of talented workers, universities with extensive high-tech R&D activities, and urban anchors like Fortune 500 corporations in emergence of high-tech zones (Audretsch & Feldman, 1996; Zhu, 2000). Respectively, we use the Longitudinal Employment Household Dynamics data to select the high-tech zone candidates with above average number of workers with higher education and use NSF data to control for proximity to the region's

research universities weighted by university's R&D expenditure. We also account for the proximity to the Fortune 500 Headquarters. Our findings on spatial distribution of high-tech zones contribute to literature by allowing comparison between geography of innovation with stronger innovation clusters in the northeast and west territories of the U.S. and geography of high-tech zones with strong presence in south. Relatively, hosting urban anchors and national festivals help emerging high-tech zones particularly in south like Austin, Texas which is home to the South by Southwest Interactive Festival, attracting other Fortune 500s to Austin. Complementary to our study would be analysis of the negative impacts of high-tech zones on communities such as emergence of displacement, wealth or educational segregation.

In phase 2, we further study the supportive policies, regulatory structures and incentives in the top 10 MSAs that have the highest share of their regional employment in the high-tech zones. The majority of top 10 zones are emerged in a path dependent manner such as Bay Area's Silicon Valley, city of San Francisco, Boston's Route 128 and Seattle in Washington. However, our policy analysis shows that Market Payroll Tax Exclusion policy is supportive and successful in converting downtown's market structure from Finance, Insurance and Real Estate (FIRE) to STEM; for instance in San Francisco South of Market Area. At the regional level, stronger regional transportation system is a key to enhance accessibility to more high-tech zones. Thus, a combination of local policies (i.e. financial incentives that attract start-ups) and regional policies (i.e. enhanced regional accessibility to the zones) is key to be among the top 10 high-tech regions.

RESPONDING TO DROUGHTS: A SPATIAL REGRESSION ANALYSIS ON INNOVATION IN THE WATER SECTOR

Abstract ID: 980

Individual Paper Submission

EL-KHATTABI, Ahmed Rachid [University of North Carolina at Chapel Hill] khattabi@live.unc.edu, presenting author

The literature on water innovation raises the concern that innovative activity is perceived to be lagging in the water sector relative to activity in other environmental sectors (Wehn and Montalvo 2017). Water utilities, for example, have preferred traditional low-cost solutions to innovative engineering approaches and technologies even when the innovative approaches have proven more effective in private industry and in overseas markets. Others have pointed to less patent activity in the water sector relative to other environmental sectors. It is not clear, however, that comparisons to other fields in terms of patent innovation reveal a deficit of technological innovation (Ajami et al 2014).

As a resource, water is unique in that its availability is largely subject to variability in local climate conditions and geographical differences. Climate change is challenging some of the long-held assumptions of many water managers regarding the occurrence of extreme events, specifically droughts. These events not only test the resilience of many water systems, but also bring to the light geographic realities that affect local climate

conditions, obviating a need for innovations and approaches that can provide solutions that are more resilient to change.

In this paper, I investigate the relationship between droughts and water related patent applications in the context of the United States, using a time series of US Metropolitan Statistical Areas (MSAs) from 1976 to 2016. To do so, I exploit both geographic and temporal variation in innovation patterns to explain potential climate-related drivers of innovation in the water sector. Furthermore, I investigate whether droughts affect different types of institutions differently.

This paper will contribute to the existing literature in two ways. First, the empirical evidence in the environmental literature to date is based on all environmental innovation, not specifically focusing on water. Second, I explicitly take into account geographic variation to estimate the relationship between droughts and innovation in the water sector in a multivariate regression analysis. To my knowledge, this would also be the first paper that examines the relationship between extreme weather, droughts, and environmental innovation. My contribution to the literature would be to better understand the economic incentives that lead firms to develop new product in the water sector.

PRIVATE BUSINESSES IN PUBLIC COMMONS: CONTESTED COASTAL DEVELOPMENTS IN CALIFORNIA

Abstract ID: 1003

Individual Paper Submission

KELMENSON, Sophie [University of North Carolina at Chapel Hill] sophiekelmenson@gmail.com, presenting author

The California coast, like other regions endowed with natural beauty and useful resources, struggles to find equitable growth strategies that balance environmental protection. It is highly sought by multiple parties, often with competing or conflicting priorities for use. Shellfish aquaculture appears to be attractive on many accounts – advocates claim it enhances water quality and ecosystem health while also serving a thriving market for oysters on the half shell, resulting in increased stability for both local employment and wild oyster populations. Yet little is understood about implementing these projects at the local level in California – a state with some of the most stringent environmental protections in the country. This paper examines the celebrated, yet controversial, efforts in bays and ports across California to develop shellfish aquaculture as a mechanism for economic development that supports social and environmental outcomes. It studies how real actors negotiate competing narratives and normative goals of opening or expanding shellfish aquaculture operations. The project aims to clarify how and when development of the California coast is understood as a local versus regional resource; how collaborations with research institutions influence the scale of planning for environmental resources; whether there is evidence of new forms of scale reached through collective efforts; and the influence of communities on regional policy through local decisions. Using a case study approach analyzing data from interviews, observations, newspapers,

reports, and published papers, I compare contemporary efforts across California to understand how different business patterns, community efforts, and research collaborations influence the resulting development patterns and planning for multiple uses. Early evidence suggests permitting for new projects is mired in debate due to variation in community preferences, involvement of national environmental groups, uncertainty in the scientific literature on environmental impacts, and the fragmented permitting process across multiple agencies at the local, state, and national levels. Specifically, the case documents a highly contested and politicized process in which appeals to different conceptualizations of the scale of the debate may result in new collaborations – across aquaculturists and between regulators, policy makers, communities, private firms, and research institutions – that may yield environmental management and planning decisions catered to local contexts but complementary to the wider regional scale necessary to understand complex ecosystems.

The cases speak directly to ways in which planning for economic development and managing natural resources may be conflicting or congruent at the regional level, as well as challenges in citizen engagement when navigating decisions at the regional level with disparate local impacts. It also raises questions concerning the appropriate scale of planning problems and solutions; uneven spatial geography of development and resource management; and the responsibilities of private firms to environmental management and community engagement.

AGGLOMERATION IN THE POST-SPOTIFY MUSIC INDUSTRY: A STUDY OF MUSIC FESTIVAL ARTISTS

Abstract ID: 1027

Individual Paper Submission

ADLER, Patrick [UCLA Luskin School of Public Affairs] patrickadler@ucla.edu, presenting author

Few sectors have been as transformed by the digital marketplace as popular music. The Napster crisis of the late 1990s ushered in a period of reorganization for music firms, musicians and music consumers that it has not yet emerged from. Among the most powerful music firms today are companies (e.g. Spotify, Live Nation, Apple, and AEG) that either did not exist in the previous era or did not take part in the music economy. The dominant popular music business model which used live performance as a 'loss leader' to subsidize the sale of recorded music, is being recalibrated (Adler, 2014). The extent to which these organizational changes have prompted a geographic re-sorting of the music industry remains an open question, even though there have been somewhat recent studies of the topic (c.f. Florida et al., 2010).

This study deploys a novel dataset to investigate prevailing geographic patterns in the production of popular music. It is chiefly concerned with understanding the level of "absolute specialization" (Kemeny and Storper, 2016) in the sector. The dataset contains information on geographic origin, genre, and popularity for ~10,000 music acts with social media profiles in 2016, and data gleaned from these profiles. Of these roughly 3800 acts were selected to major music festivals in either 2009 or 2016 or both. A basic analysis of music festival acts finds that acts that have been selected to music festivals are at least twice as likely to be drawn from the three largest music 'clusters' (New York, Los Angeles, or London) as acts in the control group. A logistic regression analysis finds that, controlling for genre and popularity, the probability of being selected to a festival rises for acts from

these areas, from the hometown of a given festival, or from the hometown of the firm promoting the festival. These effects are stronger among acts from 2016 festivals than 2009 festivals.

Taken together, these results suggest that the digitization of music has not been accompanied by the spatial democratization of music production. While digital marketplaces for music theoretically make it easier for musicians to ‘plug and play’ from anywhere, and while artists in New York and LA might have as much physical access to the music festival circuit as artists from elsewhere, musicians from music clusters would seem to still have advantages. If anything, the ‘tyranny of the cluster’ might be stronger now than it was in 2000. This finding is not only consequential to policymakers in music clusters but to local economic development officials from less central regions who seek to build such clusters. They suggest that policies which target the local music industry must contend with strong agglomeration economies.

DO CLUSTERS FAVOR SMALL FIRMS ?

Abstract ID: 1037

Individual Paper Submission

FANG, Kerry [Florida State University] kfang@umd.edu, presenting author

Research Question: Do clusters improve the innovativeness of small firms more than that of the large ones? And if so, by how much and why?

Background: Small and medium-sized firms employ over 80% workers in the United States. Studies found that small firms contribute disproportionately to job creations and innovation, and are hothouses for entrepreneurs (Haltiwanger, Jarmin, and Miranda, 2013). Understanding whether clusters—co-location of firms and workers in related industries—benefit small firms is useful. For policymakers, it's important to know whether cluster-oriented policies, widely adopted by the federal, state and local authorities, assist these firms to innovate and grow. For entrepreneurs, it helps to evaluate whether their businesses will be the winners or losers in clusters, and facilitate their location choices.

Methodology: This paper uses a unique restricted version of the plant-level dataset from the Quarterly Census of Employment and Wages for the state of Maryland from 2004 to 2013, and matches it with the patent application and citation data from the United States Patent and Trademark Office.

This paper focuses on identifying whether small firms increase patent production in clusters more than large ones, and whether they have higher mortality rates in clusters. These goals are achieved through a series of quantitative methods, including the linear regression model following Arimoto, Nakajima, and Okazaki (2014), the cox proportional hazards model and the instrumental variable approach. This paper also explains what helps small businesses to absorb cluster benefits through case studies.

Findings: The preliminary results show that small firms increase patent applications more than large firms by 4.6% when they locate in industrial clusters. However, at the same time, their mortality rates in clusters are also twice as much as outside. These results indicate that the motivational effect (Porter, 2000) is likely to be what drives small firms to improve more than large firms in clusters. If they cannot improve faster than large firms,

which have more financial channels and internal resources, they will fail in the tough competition in clusters. The final part of the project is still ongoing, and the final result through a case study would show us whether this explanation holds.

Relevance: This paper contributes to the following lines of studies: the heterogeneous effect of clusters on different firms, the determinants of small firm success, and the mortality of firms in clusters (De Silva and McComb, 2012). This paper is also helpful for practitioners and policymakers. It serves as a guide for entrepreneurs to make better location choices, and for policymakers to evaluate the effects of cluster-oriented policies on different types of firms and to implement appropriate interventions.

HAMIDI, Shima [University of Texas, Arlington] shima.hamidi@uta.edu, co-author

Creative industries have gained increasing attention in light of creative economy as viable magnets for economic development in cities and communities. The value of creative industries' production in the U.S in 2014 was 4.2% of the national gross domestic product, which contributed more to the national economy than did construction, mining, utilities, insurance, and accommodation and food services industries (National Endowment for the Arts 2017). Posited as new economic frontiers for the planning literature, creative industries have resurfaced in what have become "cool cities" (Markusen et al. 2008). Existing literature demonstrates that the location of creative industries tends to be place-specific. While creative industries seem to prefer dense and mixed-use neighborhoods, access to urban amenities, land-use mix, transit, and walkability offered in compact, as opposed to sprawling, urban areas could potentially contribute to the location preference of creative industries.

At the regional level, creative industries can benefit from more compact metropolitan areas with greater accessibility to regional destinations, public transit, and lower transportation cost and travel time. At the local level, compact neighborhoods facilitate knowledge spillovers through agglomeration economies and increasing social capital. However, despite research on the role of physical and socio-demographic characteristics of communities in the geography of creative industries, there has been little investigation on the impact of urban compactness on location preference of creative industries.

This article addresses the gap in the literature and examines the relationship between urban compactness and the location preference of creative industries in all census tracts of 374 metropolitan areas. This is one of the first national studies that investigate this relationship, drawing on Multi-Level Modelling to control for both neighborhood and regional characteristics. It uses the North American Industry Classification System developed by Markusen et al. (2008) to define the creative industries from a range of sectors directly involved in creative production. Data for the location of creative industries comes from 2016 ESRI Business Data Source that provides address-level employment size and sales volume for all firms within the United States. For capturing compactness, this study uses Ewing and Hamidi (2017) Compactness Index, at both census tract and metropolitan levels, comprising land use mix, development density, activity centering, and street connectivity. In addition, this study controls for walkability, transit accessibility, and other socioeconomic characteristics of the neighborhoods.

Our findings confirm that more compact and walkable neighborhoods with better access to transit, social interaction opportunities, a mix of uses, and quality urban amenities are correlated with the concentration of creative industries. Our results also suggest that live-work relationship is of crucial importance since the residential location of employees follow the location of creative industries.

This study points to key policy implications of location preference of creative industries for local communities. In order to promote economic growth, policymakers should consider the development of denser, more walkable, transit-served neighborhoods with a high level of land-use mix and a diverse range of urban amenities to attract and support creative industries while paying attention to the local characteristics of communities. These recommendations, however, require a few caveats as to the possibility of gentrification in socially disadvantaged communities.

THE MATURING GEOGRAPHY OF BIOTECHNOLOGY: NETWORK FORMATION AND EVOLUTION IN LEADING AND LAGGING US REGIONS

Abstract ID: 1052

Individual Paper Submission

SONMEZ, Zafer [University of Illinois at Chicago] zsonme2@uic.edu, presenting author
HABANS, Robert [University of Illinois at Urbana-Champaign] rhabans@gmail.com, co-author

Knowledge intensive industries such as biotechnology are characterized by spatial concentration and networks of organizations and inventors. Previous research generally acknowledges and has empirically shown that knowledge networks play a crucial role in sustaining the vibrancy of regional clusters and, by extension, the economic development of regions (Huggins and Prokop, 2016). However, we still have limited understanding of how networks emerge and evolve over time. Although there is a large body of research in regional studies, economic geography, and related fields that examines the association between regional/network-level factors and cluster outcomes, the research on factors that give rise to network structures is relatively scarce. Part of the problem in this area of research has been the paucity of methodological techniques that are capable of dealing with dependencies and simultaneity inherent in relational data (Glückler, 2007; Broekel et al, 2014). Additionally,

this research rarely compares successful and less successful clusters in systematic ways and thus tends toward retrospective explanation, predetermining the importance of historical contingencies and geographical proximities in the emergence and transformation of regional networks (Powell, Packalen, and Whittington, 2012).

Our study takes a broader view by incorporating a broader range of regions and leveraging recent advances in the modeling of network data. Using patent statistics from 1976 to 2010, our analysis relies on a longitudinal co-invention data set with geographic and organizational indicators. First, we identify actor and dyadic-level factors in the formation of network ties using Multiple Regression Quadratic Assignment Procedure (MRQAP) to test whether the observed network relationship is extreme compared to what we would expect to find if assignment to network positions were random. The results from this procedure enable us to assess the relevance of factors such as institutional type, size, and geographical proximity in explaining properties of the knowledge network connecting biotechnology organizations.

Second, combining insights from organizational and economic sociology with the more spatial perspective of economic geography and regional studies, we examine the evolving regional geography of the biotechnology industry in the US. For this purpose, we use conventional regression and dynamic social network modeling approaches to examine network evolution over time. This approach offers the opportunity to understand whether actors collocate because they already have knowledge ties or if they start to build relationships because they are already spatially close. The findings illustrate how organizational diversity within a regional network and a high share of intra-regional ties relative to extra-regional ties explain the diverging paths of leading and lagging clusters.

We envision this research as addressing sources of bias in attempts to extrapolate policy relevance from observational studies of the development of innovative clusters. Our findings differentiate the extent to which network properties, including the degree to which they are regionalized, are purely path-dependent or a product of regional and/or firm characteristics that might be manipulated through the levers of economic development policy. In addition, this framework could be extended to examine the link between network properties and a variety of outcomes of more general relevance to the region, such as functional specialization, tie-ins with anchor institutions, and employment outcomes.

ARE INCLUSIVE CITIES MORE PRODUCTIVE? EVIDENCE FROM INTERNAL MIGRATION IN CHINA

Abstract ID: 1079

Individual Paper Submission

HU, Wanyang [University of California, Los Angeles] wanyang@g.ucla.edu, presenting author
WANG, Rui [Johns Hopkins University] ruiwang@jhu.edu, co-author

Population growth has been regarded as the yardstick of urban development in urban economic theory. (Glaeser 2008) Among others, human capital contributes to urban development through their skills and positive externalities. (Ethan & Peri 2015; Moretti 2004) Most changes in urban population and human capital concentration occur through migration, especially internal labor migration across cities/states. (Glaeser 2008) To

boost local development, cities strive hard to create jobs and amenities in order to attract labor, especially skilled-labor. (Partridge 2010) Among these policy options, a favorable local institutional environment (either formal or informal institutions), such as an open attitude towards cultural diversity, is argued to be attractive to skilled labor and is positively associated with urban development (Florida et al 2008). However, it is less known to what extent urban migrants in general, in addition to the creative class, respond to an inclusive urban institutional environment, especially formal institutions, and how that further influences subsequent urban development. This paper aims to fill this gap and seeks to understand how local inclusive institutional environment affects labor mobility and impacts urban development through influencing the quantity and quality of urban migrants.

The household registration system in China allows local government to determine eligibility to access local social insurance programs based on one's local residency. Taking advantage of this formal institutional arrangement, we define urban inclusiveness as the extent to which local governments allow urban migrants to access local social insurance benefits as a measure of local inclusive institutional environment to urban migrants, and we propose the following hypotheses:

Hypothesis 1: inclusive cities, i.e., cities that provide urban migrants with equal access to local social insurance benefits, attract more migrants;

Hypothesis 2: inclusive cities have better economic performance through attracting more migrants.

Using cross-city variations in social insurance coverages among urban migrants in the National Migrant Survey in China, we construct urban inclusiveness indexes for over 200 Chinese cities with factor analysis. We develop a two-sector structural model to theorize how urban inclusiveness influences urban migrant population size and urban productivity through consumer utility and firm output maximization. Reduced-form regression results without and with instrument variables indicate that controlling for urban native population, natural amenities, current human capital stock and migration cost, more inclusive cities tend to attract more migrants, and inclusiveness is positively associated with the nominal wages of both the high-skilled and low-skilled migrants, particularly that of the high-skilled.

This research contributes to current understanding on the role of local institutional environment in labor mobility and the resultant urban development. Our findings suggest cities with favorable institutional environments to urban migrants tend to attract more migrants and have better economic performance.

CREATING OPPORTUNITIES AND CONFRONTING TRADITION: AN INVESTIGATION OF AMENITY MIGRATION AND CREATIVE INDUSTRIES IN SMALL TOWNS OF THE MOUNTAIN WEST

Abstract ID: 1094

Individual Paper Submission

SHELBY, Jennifer [University of Colorado Boulder] jennifer.shelby@colorado.edu, presenting author

Amenity migration became a driver of change and economic growth throughout the Mountain West in the late 1990's with several scholars documenting the pattern and its dominant traits of pursuit of experience, desire for outdoor recreation and nearness to impressive landscapes, and small town atmosphere. Many small western towns transitioned from places of production, primarily supported by agriculture, mining, and manufacturing, to places of consumption, with economies driven by tourism and recreation, offering experiences to visitors and new residents (Shumway and Davis 1996; Hines 2007).

Over the last decade, a new pattern has emerged as creative economies have been developed throughout the region as a mechanism for inducing economic growth and drawing innovative, knowledge based workers (Grodach et al 2014). Put together, this creates greater complexity for small towns with only limited capacity to implement change. Literature on amenity growth has diminished and little research addresses the issue of creative economies in the Mountain West.

It is theorized that creative class workers tend to select their location because of additional amenities such as access to outdoor recreation and local culture that fosters creativity and exploration (Markusen and Schrock 2006). This puts the American West in a prime position for the development of creative economies in rural and urban places, evidenced by formal and informal agglomerations of creative production present throughout the region (Markusen 2007). This research aims to fill a gap in the literature regarding the intersection of amenity migration and creative economies by answering the following question: Is growth in small Mountain West towns a result of continued amenity migration, or an emergent pattern, and in what ways is this related to creative economy development?

This exploratory study reveals patterns of migration that indicate changes in the patterns of growth and development for small towns of the Mountain West. Migration, demographic, and economic data spanning the last twenty years reveal concentrations of population increase or decline, changes in dominant economic sectors, and variations in the groups of people occupying these spaces. Specifically, I focused on concentrations of agriculture, manufacturing, mining, tourism, recreation, and arts industries for patterns of change in average income, overall productivity, and industry dominance. Amenity migration theories documented general changes in the motivation of migrants coming to the Mountain West. However, reality has turned out to be increasingly complex as old and new residents negotiate new identities of place.

UNDERSTANDING THE DETERMINANTS OF SMALL- AND MEDIUM-SIZED HIGH GROWTH FIRMS IN MANUFACTURING SECTOR: IN THE CASE OF THE CITY OF INCHEON

Abstract ID: 1145

Individual Paper Submission

JUNG, Namji [Incheon Development Institute] namji.jung@gmail.com, presenting author

This research attempts to identify important characteristics of small- and medium-sized high growth firms in manufacturing sector by using the case of the City of Incheon. With the growing literature in this area, we now

know that a small number of HGFs creates most new jobs at a specific point in time; they tend to be young but not necessarily small in size; and entrepreneurial or innovative firms are more likely to be HGFs but they are not necessarily high-technology firms (Coad et al., 2014; Jung, 2017). While these findings are informing, they are limited to tell us about what more specific characteristics and elements HGFs share, how they operate and, more importantly, whether HGFs static and dynamic characteristics are replicable. Understanding these aspects might help researchers and policy makers to predict which firms are likely to grow and how to support them. It is known that high growth period is not persistent overtime thus it is difficult to target potential HGFs. Reasons might be the lack firm specific panel data with attributes to help understand important internal firm aspects. Existing studies identifying the internal firm characteristics of HGFs often use variables from the firm's financial statement (Hong et al, 2016).

Extending the existing studies on HGFs, this research builds a matched employer-employee panel data for small- and medium-sized manufacturing firms in Incheon. The data set contains a wide spectrum of variables from the general characteristics of the firm (i.e. firm size, firm age, and the subset industry sectors of manufacturing) variables from the firm's financial statement, and innovation activities to basic HR practices.

In carrying out analyses, this research sets up a few structured steps. First it categorizes HGFs according to their growth patterns reflecting the dynamics between the sale growth and employment growth. Those categories include: 1) high sales growth firms, 2) high employment growth firms, and 3) jobless growth firms (sales growth rate-employment growth rate > 0). Next, this research builds statistical models by using logistic panel regression on each HGF category to identify what internal firm characteristics are related to the firm's high growth. Finally, it compares the characteristics of HGFs with non-HGFs, HGFs in only one point in time, and HGFs over two periods.

This research adopts the OECD definition of HGFs, the enterprise with average annualized growth greater than twenty percent per annum, over a three-year period, and with ten or more employees at the beginning of the observation period. The employer-employee matching dataset is created by merging entrepreneurial firm data collected by Korea Enterprise Data(KED) and Employment Insurance Data(EID) collected by the Ministry of Employment and Labor.

The richer information on HGFs in a specific industry sector might help us to enhance our knowledge about HGFs that could possibly be relevant to firms in the same industry sector but in different cities and regions.

EMBEDDING MOBILITY: TRAINING INSTITUTIONS AND INCLUSIVE DEVELOPMENT IN PERNAMBUCO AND RIO DE JANEIRO, BRAZIL

Abstract ID: 1156

Individual Paper Submission

GUINN, Andrew [UNC-Chapel Hill] arguinn@live.unc.edu, presenting author

Under what conditions can workforce development initiatives promote both economic growth and inclusive social mobility? Training programs regularly struggle with a dual mandate of providing valuable human resources to

employers and also creating pathways of mobility for disadvantaged and low-skilled workers. On the one hand, many critics disparage training programs as too-often useless to trainees and employers alike, typically due to a poor understanding of employers' labor needs (Osterman and Batt 1993). On the other hand, even programs that are successful are frequently criticized because they encourage employers to "cream" those trainees who are most likely to prosper, and neglect others who may be in greater need of support or advocacy (Giloith 2000). As economic development planners in the US and throughout the world grow increasingly interested in the expansion of training institutions as an avenue to both economic development and social inclusion (Clark 2014, Lowe 2015), we lack a firm understanding of how, and the conditions under which, workforce development can live up to this hope.

To address this gap, I present a set of practical and theoretical lessons from Brazil, where a series of policy reforms between 2003 and 2015 led to an expansion of training institutions throughout the country that proved to be both exceptionally effective (that is, they exhibited high job placement rates) and remarkably inclusive. In this paper, I use a comparative case study design to understand, in a grounded way, how new training programs became implemented within diverse labor markets and sectoral contexts, and the factors that explain success and failure with respect to: 1) their effectiveness in addressing sectoral workforce challenges and 2) their inclusiveness, that is their capacity to facilitate economic mobility in a way that is socially broad-based.

I present nested case studies of programs in Pernambuco and Rio de Janeiro, some of which were successful, others less so. In explaining this variation in outcomes, my cases focus on how state-level education networks interpret federal training policies and how individual schools within these networks implement policies in three areas: recruitment, programming, and the matching of graduates with firms. The cases of Pernambuco and Rio de Janeiro offer an analytically rich combination of similarities and differences. Both states experienced high levels of year-on-year growth in enrollments in training courses and a substantial expansion in the number of institutions offering these courses. In Pernambuco, a relatively poor and unindustrialized state, training schools developed in conjunction with the establishment of large employers in the context of "greenfield" industrial projects. I focus in this state especially on the articulation of a new training network around a recently installed automotive cluster, as well as a shipbuilding cluster. In Rio de Janeiro, on the other hand, training schools expanded in a mature labor market context, where employment gains came about through entrepreneurship and job creation within small firms, especially in the services. Here, I focus on training programs related to the tourism, healthcare, and footwear industries. In explicating these cases, I draw on data from the economic and educational censuses, archival documents and news articles, and interviews with schools, firms and trainees.

Mining variation in how training programs were implemented, I show that the programmatic success of these training initiatives depends on their horizontal relationships with employers. I argue that inclusiveness is largely driven by top-down policies, and schools and municipalities have developed innovative recruitment and programming strategies to accommodate these.

GOING LOCAL: PLACING ENTREPRENEURIAL MICROGEOGRAPHIES IN A LARGER REGIONAL CONTEXT

Abstract ID: 1164

DONEGAN, Mary [University of Connecticut] mdonegan@live.unc.edu, presenting author
LOWE, Nichola [University of North Carolina] nlowe@email.unc.edu, co-author

As cities seek to promote innovation they are increasingly investing in localized institutional entrepreneurial supports with the goal of intensifying innovation-enhancing interaction and related entrepreneurial activities. Within regions, a select group of institutional supports can be classified as hyperlocal—insofar as their entrepreneurial influence is highly concentrated within a neatly bounded geographic sub-space. From incubators and co-working spaces to accelerators and innovation districts, these localized supports aim to both place entrepreneurial ventures on successful paths while funneling them within spatially-bounded microgeographies. The resulting spatial configurations speak to the power of institutional actors in shaping small-scale innovative geographies but also raise broader questions about their effects on fundamental entrepreneurial decisions and behavior.

Scholars of economic development have begun to critically evaluate the role these institutional supports play in the entrepreneurial experience, even as questions remain about the appropriate scale of institutional intervention and the resulting effects on entrepreneurial decision-making (Block 2008; Mack and Credit 2016; Schrank and Whitford 2009). In this paper, we extend this nascent field by considering the influence of universities on entrepreneurial activities within their immediate surroundings. We focus on the University of North Carolina (UNC), where actors from the business school helped build a unique web of hyperlocal entrepreneurial supports that reinforced core educational and research missions but also culminated in the creation of proximate university business incubators. Our approach is rooted in what Siegel and Wright (2015) characterize as a much-needed ‘rethink’ of academic entrepreneurship, one that shifts characterizations away from a tightly structured institutional drive for revenue and towards a holistic, multinodal ecosystem driven by a wide-ranging set of university stakeholders and entrepreneurial advocates.

Using a series of interviews and a novel dataset on start-up firms (Feldman and Lowe 2015), we first trace the emergence of entrepreneurial supports at UNC before asking: how have these programmatic changes altered the entrepreneurial experience for life sciences firms founded by UNC employees between 1990 and 2012? We identify three notable shifts in established entrepreneurial practice. First, we observe an upward trend in the annual number of new life science establishments founded by academic entrepreneurs. Second, we find a growing spatial concentration of life science firms indicating a tightening of the boundaries of UNC’s entrepreneurial microgeography. Finally, we find an unanticipated consequence: life science start-ups are now more likely to launch at an earlier phase of technology development compared to previous counterparts. We suggest these trends are interconnected and reinforce firm dependence on UNC’s support system and institutional network.

The case has broad implications for how we characterize the contribution of universities to local and regional entrepreneurship. The findings suggest a clear link between strengthened entrepreneurial programming and the emergence of new firms. Yet the findings also highlight a tension inherent to programmatic expansions. Universities, even as they strive to create protected environs for nascent firms, remain well-established and much-needed anchors in the larger regional economy. This dual nature creates a predicament for regions and their universities. Walling off an internal microgeography has the potential to increase a university’s immediate influence over local entrepreneurship. Yet, it also risks disconnecting emerging entrepreneurs from the larger ecosystem’s valuable resources and stunting or removing knowledge generated by academic firms from the larger ecosystem. In other words, the institutional model of mirroring a regional entrepreneurial ecosystem on much a smaller scale, while improving the entrepreneurial experience and increasing the number of firms within the microgeography, may have unintended consequences not just for the academic firms but for the region, too.

MEASURING REMOTE WORKER EMPLOYMENT AND OCCUPATIONS

Abstract ID: 1173

Individual Paper Submission

WALLACE, Ryan [University of Southern Maine] rdwallac@larp.umass.edu, presenting author

The nature of work is changing. Recent evidence suggests nonstandard work arrangements are growing (eg. Kats and Krueger, 2016; Liu and Kolenda, 2012) and global economic pressures and rapidly advancing digital information and communication technologies are helping to reshape how and where work is done (Carnoy et al 1997; Blakely, 2001). Workers, particularly high-skilled knowledge intensive ones, are demanding greater flexibility outside of standardized work arrangements and unified locations. Firms, meanwhile, are seeking new means to access specialized talent absent in local labor pools. Many jobs can be completed entirely 'remote', or that are locationally independent from a unified central office location, especially those occupations that are information or digital knowledge intensive. Remote workers are distinct from the more ubiquitous teleworker in that remote workers are not geographically dependent on a physical location to do work. This suggests remote workers may be more footloose in locational decision making and that firms may not be limited to local labor markets to access workers.

There has been growing interest by researchers, policymakers, and economic development professionals on the implications of remote work, and the changing nature of the workplace more broadly, for regional economies, labor markets, and place. Remote work is viewed as a potential means to attract transient residents based on high quality of place factors, to link incumbent residents to economic opportunities, or assist firms in accessing specialized workers absent in the local labor pool. Yet, a measurement framework for counting and understanding remote work employment and the implications of it is lacking.

This research begins filling this knowledge gap by presenting a method for measuring remote workers based on a conceptual framework constructed from related literatures (Garrett and Danziger, 2007). I use microdata from the Integrated Public Use Microdata (IPUMS) American Community Survey (ACS) and Decennial Census, and data from the Occupational Information Network (O*NET) to construct measures of remote workers and their occupations and industries. Findings indicate that the share of remote workers has grown significantly since 2000, with remote workers that are W-2 employees growing the fastest compared to those identified as self-employed, 1099, or freelancers. Remote workers have significantly higher levels of educational attainment and income compared to non-remote workers, although at least part of this difference can be explained by the types of occupations remote workers do. The paper also presents findings from the occupational and industry analysis and discusses uses of this data for practicing planners and researchers alike.

IS IT TIME TO RETIRE THE TERM “INNER CITY?”: RE-EXPLORING THE GEOGRAPHY OF METROPOLITAN DISTRESS

Abstract ID: 1176

Individual Paper Submission

LESTER, Thomas [University of North Carolina, Chapel Hill] twlester@unc.edu, presenting author
KAZA, Nikhil [University of North Carolina] , co-author

The term inner city was thrown around in a cynical and derisive manner during the 2016 presidential election, drawing criticism that it was merely a loosely coded racial epitaph. Yet, during the same year gun violence spiked in Chicago, with shootings clustered in set of neighborhoods on the South and West sides far from the rejuvenated downtown area. While Chicago’s violence problem—itsself an extreme symptom of economic distress—is geographically tilted towards the “inner city,” suburban areas are not immune to economic decline and social upheaval, as the events in Ferguson, MO highlighted. In fact, a host of research during the 2000s focused on the suburbanization of poverty and the decline of so-called “inner ring” suburbs (Kneebone & Garr, 2010). Given its contradictory and confusing usage in the public discourse and the blurring of jurisdictional lines among some researchers, it is time to ask the question: Is the term inner city still a valuable category of analysis for social scientific analysis? On the one hand, there is a spate of recent work research by a diverse set of social scientists that suggests broadly that geography matters more than ever in determining an individual’s chances of economic and social mobility (Chetty, Hendren, Kline, & Saez, 2014) This work implies a policy approach that begins with an assessment or categorization of neighborhoods by some kind of socio-economic status and/or opportunity index. On the other hand, recent demographic shifts—specifically the shift of wealthier professional workers into urban neighborhoods (i.e. gentrification)—and the economic restructuring of central city economies away from production jobs and towards professional services and consumption-based sectors challenges the traditional definition of the “inner-city.” Recent work highlighted that employment actually grew faster in core urban neighborhoods than the traditional central business districts or suburban areas during the 2000s (Hartley, Kaza, & Lester, 2016)

In this paper we (re)assess the term inner-city in both its theoretical and empirical dimensions. We first track the history of the concept through a critical review of the literature and an analysis of its usage overtime using Google N-gram, paying particular attention to how the term was and still is defined in racialized terms. Next, we track the changing geography of metropolitan economic distress using three different definitions of tract-level economic criteria—following Porter (1997) and Jargowski (1997)—from 1970 to 2015 using data from the Brown University Longitudinal Tract Database (LTDB). We find that while there has indeed been a shift in the number of census tracts classified as economically distressed (e.g. high poverty) from central cities to suburban areas, the shift is modest in scope. We extend this analysis by exploring the factors that lead some metropolitan areas to reduce the “centrality of distress”—defined as the proportion of distressed tracts located in the central city—more than others. Finally, we conduct a spatial contiguity analysis of distressed tracts within all U.S. metropolitan areas to determine whether there has been a diffusion or continued clustering of economically distressed neighborhoods overtime.

We conclude the paper by highlighting the implications for both policy and theory of the increasingly divergent patterns in the geography of metropolitan distress—with some regions following the traditional 20th century pattern of concentrated urban poverty in the midst of regional growth while others have seen a wholesale shift of poverty to distant suburban jurisdictions. Ultimately the authors argue that planners need a more nuanced, and less racialized vocabulary to describe the problem of concentrated poverty and neighborhood economic distress.

PLANNING FOR LABOR MARKET RESILIENCE: CAN BIG COMPANIES CREATE A BIG TENT?

Abstract ID: 1218

Individual Paper Submission

FORBES, Allison [University of North Carolina at Chapel Hill] allisonf@live.unc.edu, presenting author

Experts report that larger firms' training needs shape our public workforce development systems (Berger 2013). States spend tens of millions of dollars to subsidize the training programs of the largest firms, often adding these subsidies to already robust relocation and expansion incentives. And large firms are well positioned to reap the benefits of any public investments in training (Christopherson & Clark 2007).

Smaller firms, which employ about half the U.S. workforce, are less likely to train and pay lower wages than their larger-sized counterparts, contributing to labor market inequities (Osterman & Weaver 2014). Scholars have recommended directing federal funding to smaller firms, but have failed to ask whether state responses to the training demands of large firms, including investments in physical and human resources, can be leveraged. I answer this question in the context of the U.S. automotive sector, comparing the skill demands of large lead firms, like Ford or Toyota, with the skill demands of their parts suppliers, in order to inform the design of public training programs. I utilize data from U.S. Bureau of Economic Analysis Input-Output Tables, Bureau of Labor Statistics Occupational Employment Statistics and O*NET Online to supplement case studies of automotive clusters in the southern United States.

By focusing on how occupational skill requirements vary across industries and firm size, this research can help state and local policy makers ensure that smaller firms and their workers are not limited in their development trajectories by outdated or outsized training plans and curriculum. By considering firm size, this research improves assessments of worker mobility and can be used to update occupational transition plans for displaced workers. The paper discusses how related human-centered development strategies reach across industrial sectors and increase regional competitive advantage, but also how human resources can strengthen labor market resilience in the face of industrial change.

This paper addresses the automotive case in order to inform broader debates regarding how technology and trade may disrupt the automotive and related sectors. Understanding how skill requirements differ across sectors should inform how micro- as well as macro-economic studies measure skill as a component of value-added in global trade.

THE RESURGENT IMPORTANCE OF CENTRAL BUSINESS DISTRICTS TO REGIONAL ECONOMIES

Abstract ID: 1222

Individual Paper Submission

OSMAN, Taner [UCLA] tanerosman@ucla.edu, presenting author

Recently, planning scholars have enthusiastically embraced the prospect of an ‘urban revival’, which describes the process by which long-term trends in the suburbanization of jobs and population may be reversing. There is mixed evidence in support of the urban revival hypothesis. In relation to population patterns, some evidence suggests that, while there has been growth in the center of regions, such growth continues to be slower than suburban population growth. Furthermore, the idea of an urban revival has been criticized on the grounds that it has been largely confined to a handful of large metro areas, and limited to relatively affluent, white, young professionals. In relation to employment patterns, the evidence is again somewhat mixed, with some studies showing that jobs have been growing quicker in the center of regions than in the suburbs while other studies have shown the opposite. The proposed paper will examine evolving employment patterns in the 150 largest metropolitan regions in the U.S. since the mid-1990s. The present analysis seeks to answer two primary research questions. First, over the period 1994-2015, have employment levels grown in central business districts (CBDs) relative to growth in the broader regional economy? Second, has the quality of jobs (measured in terms of wages and task content) in CBDs improved over this period, especially relative to the rest of regional economies?

In this analysis, central business districts are defined according to the definitions of the census of retail and trade in 1982. These definitions have been updated to allow for changing patterns of density and development within regions since this time. The primary data for this analysis is drawn from the Census Bureau’s Zip Business Patterns (ZBP), which provides zip code level employment and establishment counts at disaggregated levels of industrial classification. Zip level data are matched to census tracts (upon which CBDs were defined by the Census Bureau) using a crosswalk provided by the Department of Housing and Urban Development. For each of the largest 150 metropolitan areas in the U.S., concentric rings have been created around each CBD at distances of 1, 3, 5, 10, 15 and 20 miles. The ZBP data on employment and establishment counts, as well as wage data, have been assigned to each ring for each year of analysis. ZBP data are available covering the period 1994-2015.

Preliminary analysis finds that the regional share of jobs in (and close to) CBDs is largely unchanged since the 1990s, but there are clear qualitative differences between the jobs found in CBDs in the 1990s and the present period. Since the 1990s, relatively more productive, and higher paying jobs have been locating in central business districts than in the recent past. As such, central business districts are increasingly serving as wealth generators for regional economies. The regional multiplier for CBD jobs has increased markedly since the 1990s: on average, jobs in the CBD create roughly 25% more regional jobs than was the case in the 1990s. This work adds to existing research by demonstrating that while the relative quantity of jobs in CBDs has been somewhat constant over time, the importance of CBDs to regional economies has increased markedly.

HARPER-ANDERSON, Elsie [Virginia Commonwealth University] elharperande@vcu.edu, presenting author

Creating jobs and connecting people to work has been an enduring focus of urban policy and scholarship. Scholars have been explicitly calling for a greater connection between workforce development and economic development for the last two decades (Fitzgerald, 2004; Giloth, 2000; Harrison & Weiss, 1998; Meléndez & Harrison, 1998; Harper-Anderson, 2008). The call was framed as a means to enhance regional economic competitiveness and efficiently achievement of goals on both sides. Much progress has been made in both policy advancements and scholarly work. The focus on competitiveness and growth has raised some questions about implications for equity, shared prosperity and more specifically poverty alleviation. While theoretically linking local workforce development programs to and local economic development initiatives could help alleviate poverty by connecting people to work, if disadvantaged population are not intentionally included, they may not benefit.

The concepts of inclusive growth and shared capitalism have gained popularity as frameworks for thinking about strategies to address those left out of the prosperity. There has been increased attention on a group of programs addressing the poverty issue from the ground up. Community wealth building (CWB) has become the new catchphrase for policymakers and practitioners seeking to combat poverty and bring about self-sufficiency for vulnerable people and communities. CWB initiatives have received the most attention but included in the group are shared capitalism initiatives and anti-poverty programs. Reducing poverty on a city or regional scale is extremely complicated. The core mechanisms for doing so are directly tied to creating jobs (i.e. economic development), connecting people in poverty to those jobs (i.e. workforce development), and creating opportunities for broad-based economic security through various other models of shared revenue. The precise approach to implementation of these strategies varies across local contexts.

In an ideal world, the four pillars of economic growth, sustainability, and inclusion (economic development, workforce development, entrepreneurship and community wealth building) would constitute an ecosystem of sorts and all connect in a comprehensive system working toward the joint goals of regional economic and social well-being. However, it is not clear whether newly established CWB initiatives are being integrated with existing functions in a way that would allow for these strategic linkages to take place.

The purpose of this study is to explore the connections between these four pillars by examining four cases with varying approaches to CWB and their integration in local contexts. This study both compares models of connectivity across cases and looks collectively at types of connectivity between the various components. Case cities will include Richmond, Newark, Rochester, and Cleveland.

Four research questions drive this study.

1). What is the model of CWB being pursued in each region? 2) What are the connections (deliberate or not) between CWB, WD, ED, and entrepreneurship? 3) What are the measurable and non-measurable outcomes of linkages between the three? and 4) What factors could allow for more strategic alignment and collaboration across these functions?

Results could help us better understand how to best integrate and refine this emerging strategy to increase its effectiveness in a variety of contexts.

PLANNING FOR INNOVATION IN AN ERA OF GROWING WORKPLACE MOBILITY: THE CASE OF INNOVATION DISTRICTS

Abstract ID: 1228

Individual Paper Submission

KILFOIL, Patrick [McGill University] patrick.kilfoil@mail.mcgill.ca, presenting author
PAJEVIC, Filipa [McGill University] filipa.pajevic@mail.mcgill.ca, co-author

According to sociologists Zygmunt Bauman, Manuel Castells and John Urry (among others), modern society is characterized by multiple flows of information and changing patterns of corporeal and virtual mobility. In this liquid society, advancements in technology - information and communication technology in particular - transform the geographical scope of everyday life. The Internet and ubiquitous computing have contributed to what Anthony Giddens labels a “decoupling of people, activity and place.” For a growing number of people, the digitization of activities has enabled a more fragmented (and less static!) use of space at different times of the day, the week and the year (Schwanen and Kwan 2008). As a result, human activity can no longer be confined to a single geographical scale. Work and ways of working are also being transformed. Given the flexibility and mobility imperative, the individualization of work, and the popularity (as well as frequency) of subcontracting and project-based work, firms are integrating technologies into their restructuring processes so as to enable greater flexibility and mobility of work and the worker (Kesselring 2015). Individual coping strategies and spatialities are becoming more important in understanding work organization, the location of value creation and the land use patterns of particular industries (Pajević & Shearmur 2017). However, there is scant discussion of workplace mobility in economic geography and land use planning scholarship. Meanwhile, workplace mobility, albeit gradually, is spreading across sectors and industries with little signs of stopping.

This oversight translates into economic and territorial development strategies that disregard the changing nature of work, particularly in high-tech sectors. Innovation districts constitutes an example of such a strategy. They are designated inner-city areas where research-intensive anchor institutions and companies co-locate with start-ups, business incubators and accelerators under the purview of a public-private governance body (Leon 2008). Relying on both Marshallian specialization externalities and Jacobsian urbanization externalities, the policy emphasizes proximity as an essential component of innovation processes. Innovation districts draw on a series of existing territorial innovation models (TIMs) developed since the 1980s that emphasize a static understanding of knowledge spillovers as an essential component of innovation (Moulaert & Sekia 2003). The increasing mobility of work and workers challenges the theoretical underpinnings of place-based innovation strategies such as innovation districts. Policies that assume the staticity of work are based on enduring but outdated understandings of the location of economic activities and will likely have little discernible impact on regional innovation and prosperity.

In light of this, our contribution will address the following research question: are policies such as innovation districts informed by mainstream territorial innovation models still relevant in view of real-world developments in workplace mobility? The paper will be organized as follows: first, we will conduct a methodical literature review

to develop a conceptual framework for innovation districts. In addition, we will discuss the theoretical underpinnings of contemporary real-world developments in urban policy and workplace mobility. Second, we will conduct a brief policy document analysis, highlighting the links between policy and innovation models as described/prescribed by mainstream economic geography scholarship. Third, we will present key empirical findings, extracted from in-depth interviews with ten policy makers in Toronto and Montreal, and mobile workers in Ontario's Innovation Corridor. Finally, we will discuss the findings vis-a-vis territorial innovation models. Our results show that orthodox policy approaches informed by spatially static conceptualizations of work that generally disregard how workers in high-innovation sectors actually use space in their everyday lives. There is a need to acknowledge the growing complexity of the time-space dynamic pertaining to the location of employment and value creation to ensure the long-term relevance of land use strategies such as innovation districts.

IMPACTS OF TRANSPARENCY IN ECONOMIC DEVELOPMENT SPENDING

Abstract ID: 1230

Individual Paper Submission

MARCELLO, Elizabeth [Columbia University] elizabeth.marcello@columbia.edu, presenting author

Economic development practice is rife with uncertainty and is often considered unfocused. Where evidence for the effectiveness of local economic development policy is lacking, economic development initiatives constitute good politics. At the same time, project-based economic development programs tend to complicate financial arrangements in such a way that obstructs public understanding. Notwithstanding this obstruction, studies have shown that businesses often extort public financing opportunities via local economic development initiatives, but never follow through on their promises for well-paying jobs (LeRoy 2005). While some have argued in favor of corporate clawbacks or “protective economic development” (Eisinger 1988) to protect against such abuse, businesses are often not held accountable.

Within advocacy circles, there is a push to make economic development subsidy data available to the public based on the assumption that it promotes accountability, consistent with arguments for open data and government transparency more broadly. Scant attention is paid to these advocacy efforts within academic literature, which tends to focus on improving economic development policy so it can better serve the public interest through things like a “local public balance sheet,” or a call for attention to “civic culture” in economic development planning (Reese & Rosenfeld 2001). At the same time, the call for greater transparency in economic development spending is widely accepted among advocates and planners. For example, Good Jobs First, a national policy resource center, provides a subsidy tracker that makes available to the public information on government financial assistance to businesses.

While transparency in spending is valuable in its own right, this study is the first step in understanding the value of transparency in economic development spending both internally and externally. That is, does transparency alter budgeting and administrative processes within agencies? Does it impact the practices of the agencies and other groups that hold governments and economic development agencies accountable?

Although advocates declared a victory in 2015 when the Governmental Accounting Standards Board (GASB) issued Statement No. 77, mandating that all state and local budgets after December 2015 report on revenues lost to corporate subsidies, the practice has not yet been adopted on a widespread basis and in some states there is no enforcement. Further, subsidies made by, for example, state public authorities, remain indirect or structured in a way that makes them unintelligible to the average taxpayer. Consequently, many good government groups continue advocate for transparency. For example, in New York State, groups like Citizens Budget Commission, Reinvent Albany, and the Fiscal Policy Institute advocate for a “Database of Deals” whereby the Empire State Development Corporation would create and maintain a subsidy and economic development benefits database.

At the same time, some states like Wisconsin and Illinois have such databases. This paper will describe the case of Illinois, which launched a subsidy disclosure system in 2005. Through a qualitative analysis of media, program reports, press releases, and a small set of interviews, this paper lays out an initial evaluation of the internal and external impacts of transparency to begin to understand whether and how economic development spending and practice changed after information on economic development spending was made available to the public.

This paper will contribute to substantiating the claim that more data actually leads to improved outcomes. A qualitative assessment of economic development transparency that examines practices both within and outside of government institutions can provide insight into policy adoption, policy transfer, advocacy efforts, and economic development practice more broadly. Further, building on the work of Jansa and Grey (2017), this study speaks to wider efforts to leverage economic development data in order to improve accountability and effectiveness.

WHY SECTORAL STRATEGIES IN THE GREEN ECONOMY FALL SHORT

Abstract ID: 1237

Individual Paper Submission

FITZGERALD, Joan [Northeastern University] jo.fitzgerald@neu.edu, presenting author

A strong case can be made for national industrial policy targeting clean/green sectors (Rodrick, 2014). Lacking such policy in the United States, states and cities are employing sectoral economic development strategies focusing on various clean/green technologies. While there have been many successes, U.S. states and cities are competing amongst each other while also competing with countries, such as China, with aggressive industrial policy in several clean/green tech sectors.

This paper examines this dilemma as it relates to regional and urban efforts to create supply chains in wind turbine and solar panel manufacturing. I hypothesize that competition from China is a major factor limiting the success of these efforts, and plays more of a role than problems inherent to the sectoral approach. Specifically, I examine why efforts to transition manufacturers in Cleveland and Northeast Ohio to become suppliers to turbine manufacturers fell short of their goals and how the attempt to build a solar manufacturing sector in Buffalo is faring. The analysis relies on interviews with actors involved in the sectoral efforts in both places set in the context of an analysis of national policy in China and Germany with related data on economic performance in the solar and wind industries.

The analysis is a component of a broader initiative examining green/clean-tech economic development strategies as co-benefits of climate action (see Floater et al., 2016; Rode & Floater, 2013; Fitzgerald, 2010). Fitzgerald (2010) identified three types of “green” economic development strategies: linking, which connect elements of a sustainability or climate action plan to job creation, workforce development; transformational, which green existing industries; and leapfrogging, which build new green technologies and sectors. This framework is combined with one that distinguishes between approaches that have varying degrees of spatial concentration (see table).

Sample Green Economy Strategies

Type	City	Approach	Projects	Goals
Economic development a goal of climate action plan	Vancouver	Linking, Transformational	Developing clusters in energy and other areas of clean/green economy.	
Clean/Green Tech Incubators	Los Angeles	Leapfrogging		To develop a platform to help support and grow tech industries in the Los Angeles region in energy, transportation and other sectors.
Sectoral Strategy in clean technology	Cleveland	Transformational		
	Austin	Leapfrogging		
Eco-industrial Park/District	Milwaukee	Leapfrogging	Reed Street Yards	To create and expand a mixed-use office park focusing on building expertise in water technologies.
Eco-District w/ economic development goals	Stockholm	leapfrogging	Hammarby Sjöstad, Royal Seaport	To develop export technologies in waste management, renewable energy and smart grid technologies

FIVE QUESTIONS IN CONSIDERATION OF THE DIGITAL: RECALIBRATING THE ECONOMIC DEVELOPMENT PROFESSION TO CONTEMPORARY TIMES

Abstract ID: 1266

Individual Paper Submission

MAHMOUDI, Dillon [University of Maryland, Baltimore County] dillonm@umbc.edu, presenting author
KAYANAN, Carla Maria [University of Michigan] kayanan@umich.edu, co-author

At least since the early 90s, advanced capitalist countries have witnessed structural changes directly related to sophistications in information and communication technologies (ICTs). While theories on the networked society (Castells, 1996) and the implications of time-space compression (Harvey, 1989) remain pertinent, scholars within economic geography, organizational studies, and Science, Technology, and Society studies (STS) have advanced the theories to grapple more directly with issues at the nexus of technology, the economy, and space. A global restructuring of the economy, afforded by ICTs, creates new capital-labor and capital-capital relationships. Graham et al. (1988) call this a new capitalist variant, which we argue a new digital capitalist variant introduces additional worker precarity, re-organization of the firm, changes in government policies, and shifts in global supply-chain policies. These changes across scales and boundaries require attention by economic developers and related actors seeking to foster widespread economic development, yet planning programs, and more specific to this paper, economic development scholars, have yet engaged work with this scholarship to make it legible to practitioners.

This paper is an interrogation of the continued relevance and a necessary update of economic development theories that form the canon of urban planning education. After establishing a new digital capitalist variant using a method similar to Graham et al. (1988) -- based on sectoral occupational precarity, computerization and internet adoption, capital concentration, and sectoral concentration -- we pose five specific questions that force the reframing of existing economic development theories. We work through these questions to postulate effective economic development policies that can build up and improve efforts by local actors seeking to building a tech economy.

THE ROLE OF LARGE FIRMS AND LOCAL INSTITUTIONS IN THE EMERGENCE AND EVOLUTION OF TECHNOLOGY-BASED REGIONAL ECONOMIES

Abstract ID: 1268

Individual Paper Submission

ODEN, Michael [University of Texas at Austin] oden@austin.utexas.edu, presenting author

Several interesting but potentially contradictory explanations have come to the fore to explain uneven regional growth processes. Prominent arguments and findings in contemporary economic development and economic geography literatures claim that: 1) regional growth and industrial diversification are shaped by the relatedness of localized industrial and technology bases; 2) uneven regional growth is strongly influenced by distinct territorial institutional set-ups and practices; and 3) uneven regional growth is explained by the health and vibrancy of local entrepreneurial ecosystems. The first two explanations suggest a certain path dependence based upon existing and slowly evolving local structures and elements, while the later suggests opportunities to construct new support systems or repair breaks or gaps to accelerate growth.

This paper attempts to evaluate and synthesize these three strands through a close case study of three regions that transitioned from traditional regional hubs to major technology centers over the past 40 years: Austin, Texas, Research Triangle, and Denver. Drawing upon secondary data analysis, historical/archival information, and local reports and internet sources the research will explore the significance of large public and private institutions as “prime movers” in shifting the development trajectories of these regions.

The case histories and evidence will provide insights on how more aggressive economic development institutions form, how they operate to “set off” new processes of industrial specialization and agglomeration and how they steer adaptations to rapid changes in technology and industrial structure. We hypothesize that local institutions in the three regions changed their industrial development trajectories by first recruiting large technology based public research institutions and firms. These large institutions laid the essential foundations of skilled labor, technical expertise and connections to external producer services and large markets.

Of particular interest is how local institutions engage with the large technology-based firms and research institutions they attract to expand their local operations to encompass research and product development activities. The paper explores if localization of research and product development in larger local facilities constitutes a crucial link in promoting industrial diversification and accelerating the growth of start-up and spin-off firms out of the larger incumbent firms. The research will trace the employment histories of founders, CEOs and chief technology officers in 50 small to medium-sized technology firms in each region to evaluate prior relationships to large local technology-based firms

The findings of this research can potentially delineate a new framework for explaining the emergence of new high growth regions over time. The co-evolution of regional institutions, industrial structures and the effective leveraging of opportunities for exogenous public and private investments may integrate processes of related specialization and agglomeration, unique local institutional capacities and the formation of robust local entrepreneurial systems.

ECONOMIC DEVELOPMENT AND STRUCTURAL CHANGE: A SIMULATION APPROACH

Abstract ID: 1286

Individual Paper Submission

CHO, Jaebeum [Indiana University] jaebcho@iu.edu, presenting author

Economies – whether at the national, regional or city level – develop and grow by undergoing structural change. This transformation of economies is characterized by a continuous evolution of the underlying technologies, capital, institutions, and social fabric such that markets evolve and new products emerge. At the city and regional level, local economies are also influenced by their surrounding environment through competition and collaboration with neighboring areas. These different internal and external factors constitute an “ecosystem” where a plethora of agendas act together to shape the overall outcome of the system as a whole (Batty 2013).

This paper focuses on a key characteristic of ecosystems, namely the interrelatedness of its different elements, where each component influences one another to bring about emergent outcomes. Concentrating on industrial structure as one aspect of the ecosystem of cities, I thus attempt to depict a picture of the “industry space” of cities where industrial sectors are connected to each other within a network of relatedness (Hidalgo et al. 2007). At the local level, cities diversify into and specialize in different industries as a result of regional competition and local comparative advantages. Accordingly, the evolution of a region’s industry space – and thus local economic development – can be measured by analyzing how the underlying industrial composition of the region shifts. Thus the ultimate goal of this exercise is to first accurately depict the ecosystems of cities through this network, and model structural change as a shift in the underlying industry network over time.

Utilizing data on new firm formation and industrial composition for MSAs taken from the Statistics of U.S. Businesses (SUSB) at the four digit level for the years 2005 to 2013, the underlying industry network is constructed such that the nodes are defined as individual industrial sectors. The links are defined using the Ellison-Glaeser index of coagglomeration (Ellison et al. 2010), to take into account the relatedness between any two industries. Then, any MSA’s industrial structure is depicted within the network by assigning values corresponding to the location quotient for each industry to the nodes. The final novel step is where I simulate shifts in any particular city’s industrial structure over time by considering all possible pathways for development within the network. Utilizing the Method of Reflections (Hidalgo and Hausmann 2009), I then depict a pathway for economic development that maximizes the development potential of the city, given all possibilities.

Ultimately, this study attempts to answer two questions:

- 1) Do more successful regions show different patterns of evolution compared to those that are less successful?
- 2) How should cities faced with different circumstances promote structural change such that their economic development capacities are maximized?

Preliminary results suggest that the change in industrial structure over the years for which data is available significantly shape the economic development outcomes of regions, and that in some cases these dynamics are more important than the actual industries in which these regions specialize in. In addition, more successful regions show distinct patterns of evolution that distinguish themselves with their less successful counterparts.

TIF TRANSPARENCY AS A STEP TOWARD ACCOUNTABILITY IN ECONOMIC DEVELOPMENT

Abstract ID: 1287

Individual Paper Submission

CRAFT, Andrea [University of Illinois at Chicago] acraft2@uic.edu, presenting author

Tax increment financing is a favored tool for cities to incentivize development by giving financial assistance, secured by projected future revenues, to private firms and real estate developers. Like other incentives, its capacity to use public funds to leverage private investment has relied on circumventory approaches to budgeting, marked by closed-door negotiations rather than being subject to public deliberation of municipal budgets. It has

also been roundly criticized for its role in furthering uneven development. Despite ongoing research that questions the effectiveness of incentive strategies and concerns from the public over distributional equity, TIF and other development incentives form the core of economic development policy in many cities. Policy reformers and community activists advocate for greater government and corporate transparency in order to lessen the public cost of incentives, improve the chances of beneficial outcomes, and strengthen accountability of government to citizenry.

In recent years, state and local governments have begun to collect and make available large amounts of data on public expenditures. This surge in publicly accessible data is the byproduct of advances in information and communications technology and broad interests in government transparency across the political spectrum. A push for greater transparency in public-private urban development partnerships has come from civil society's interest in open data as a route to good government, private sector advancement of software and development consultant industries, and state policies for disclosure and accounting standards (Barns, 2016). However, disclosure of economic development subsidies lags behind this overall advancement of transparency, in part due to the pseudo-public nature of development agencies and the off-budget financing modes they are able to use (Surka & Ridlington, 2016).

Chicago's TIF program is unique in the depth and breadth of its usage for a range of development goals. Accompanying this intensive use is a high degree of public literacy about TIF in popular politics. Due to the intrepid research focus on TIF by local scholars of economic development (Weber, 2002), a large teachers union organized around the impact of TIF on public schools, and a coalition of organizers and journalists, TIF has become a major focus of Chicago politics. Alongside lively debates about the appropriate use of TIF, creative strategies to repurpose TIF for community goals have cropped up as well.

The continuous scrutiny of the public spotlight on TIF has led a steadily increasing demand for transparency from local governments about how much public resources are allocated to TIF expenditures. Formerly invisible, documentation on TIF is now accessible to the public: reports are published at the state, county and city level detailing expenditures and recipients. Raw datasets of checkbook-style records at the project level are made available through data transparency websites. While TIF is enabled and regulated by state law, the City of Chicago also passed its own sunshine legislation, dictating even higher reporting requirements from TIF districts than at the state level.

Using qualitative research methods including participant observation, interviews, and analysis of planning, policy and legal documents, I examine the recent history of the phenomenon of transparency around TIF in Chicago. I develop a causal narrative of how this progress in economic development transparency was forged, highlighting the actors and stakeholders who have shifted the expectations of local government to disclose and legitimize TIF-funded projects. This descriptive study is the first step in a larger project about transparency in economic development incentives and its potential for greater accountability. Using this case study I will produce a model that I will apply to other cities to measure the activity of transparency initiatives and their potential for accountability in urban economic development.

INSTITUTIONAL LOGICS AND THE VALUE OF TIME: USING ORGANIZATIONAL THEORY TO EXPLAIN THE PARADOX OF AID AND RECOVERY AFTER NATURAL DISASTERS

Abstract ID: 1338

Individual Paper Submission

WATSON, Maria [Texas A&M University] mw574@tamu.edu, presenting author

THORNTON, Patricia [Texas A&M University] phthornton@exchange.tamu.edu, co-author

XIAO, Yu [Portland State University] yxiao@pdx.edu, co-author

Disaster assistance is generally thought as a way for communities to improve their recovery outcomes by providing the resources needed to rebuild and resume social, economic, and political functions. However, research has indicated that individual assistance to businesses after disasters is not necessarily effective in promoting their recovery (Dahlhamer & Tierney, 1996). This research uses the institutional logics perspective in sociological and organizational theory to understand the paradox of aid and recovery for businesses after disasters.

Institutional logics are “the socially constructed, historical patterns of cultural symbols and material practices, including assumptions, values, and beliefs, by which individuals and organizations provide meaning to their daily activity, organize time and space, and reproduce their lives and experiences” (Thornton & Ocasio, 1999). This research uses the case of Galveston, Texas after 2008 Hurricane Ike to illustrate the three major logics impacting recovery—the community logic, the market logic, and the state logic—as well as how relief programs vary in their effectiveness based on their grounding in each of these logics. We develop a model of institutional logic sequencing where the ordering of these logics is associated with four levels of disaster recovery resource outcomes based on the ability of each logic to operate under time compression (Olshansky, Hopkins, & Johnson, 2012). In this case, our findings show that success relies on the correct sequencing of the state and the community logic. The state guarantees financial capital whereas the community logic utilizes local social capital and networks to quickly and efficiently distribute these resources.

This research has both theoretical and practical implications for planning. We offer an introduction in applying organizational theory, specifically the institutional logics perspective, to planning issues. Natural disasters present complex challenges, requiring the coordination of heterogeneous actors over multiple levels of governance with often limited resources and time for which to accomplish recovery; the institutional logics perspective can help organize these dynamics into a broader framework for planners to use. The ideal types of the market, state, and community that we see in recovery vary in their categorical elements, for example, their stakeholders, organizational form, and exchange relations, which help can explain the motivations of various interest groups after disasters and their ability to negotiate in times of crisis. Therefore, the practical implication is that by educating planners on these broader logics, they can better navigate participatory forums in the recovery planning process. Our findings suggest that planners and economic developers are in the best position to manage disaster funds and facilitate the correct logic sequencing. We offer information on challenges in economic development after disasters and how to best structure individual business assistance after a disaster event.

IDENTIFICATION AND CHARACTERIZATION OF URBAN MANUFACTURING IN METROPOLITAN AREAS IN SOUTH KOREA - IMPLICATIONS FOR THE FOURTH INDUSTRIAL REVOLUTION

Abstract ID: 704

Poster

KIM, Jeewon [University of Seoul] jeeewonkim@gmail.com, presenting author

WOO, Myungje [University of Seoul] mwoo@uos.ac.kr, primary author

In the context of global industrial convergence and the revival of manufacturing, urban manufacturing is being re-evaluated as a potential resource for creating new goods and services and local employment. Considering the tendency of ICT industry clustering and industrial diversity in large cities, the city itself offers excellent environment of innovation. Thus, manufacturing industry located in large cities has the potential to become a new growth engine through innovation such as the 4th industrial revolution. Nevertheless, discussions on manufacturing industry in the metropolitan area is still in the beginning step and recent discussions are only limited within the boundaries of major cities.

The purpose of this study is to identify and characterize the growing manufacturing industries of the five major metropolitan cities in Korea and to suggest their potential as a 4th industrial revolution space. Specifically, first, using Industrial Manufacturing Analysis, the study identifies the growing manufacturing industry in metropolitan areas. Second, analyzing logistics interactions among counties across the country by using the cargo Origin-Destination data, which can be divided into item-based intermediate goods and consumer goods, the study clarifies urban manufacturing and related industries. Finally, the potential of the 4th Industrial Revolution through manufacturing innovation is evaluated through analysis of the industrial structures with regions that have a lot of interaction with growing manufacturing in big cities.

The results of this study can be used as basic data for establishing regional industrial policies for the forthcoming industrial revolution

FANG, QI [Shandong Jianzhu University] 787400789@QQ.COM, co-author

Traditional villages are the remnants of regional, historical and cultural changes, and they have cherished cultural values which should be given full protection and respect. In recent years, with the impact of rapid urbanization and changes of modern lifestyles, many traditional villages have been in declines due to government's land acquisition or private reconstruction of rural households, and in a result, the number of traditional villages has continuously decreased. The Chinese government has attached great importance to traditional villages and local governments have put the protection of traditional villages into agenda.

In the face of the deteriorating situation of traditional villages, planning and design personnel should explore more reasonable mode for village protection and seek for industrial development to stimulate the vitality of traditional villages. This article analyzes the development mode of Yandunjiao community in Rongcheng, Weihai by conducting field survey and proposes opinions on the problems of population hollowness, humanistic homogeneity and industrial simplification. The article indicates that the most proper way to protect the traditional villages is not to maintain them but vitalize them, thus it is a necessity to focus on the villages' industrial development by allocating local resources and culture in order to improve the economic power of the villages by which support the protection work.

TRYING TO SMART-IN-UP AND CLEANUP OUR ACT BY LINKING REGIONAL GROWTH PLANNING, BROWNFIELDS REMEDIATION, AND URBAN INFILL IN SOUTHERN ONTARIO CITIES

Abstract ID: 732

Poster

DE SOUSA, Christopher [Ryerson University] chris.desousa@ryerson.ca, presenting author

The redevelopment of brownfields and the promotion of infill in a manner that prioritizes the renewal, regeneration and retrofitting of urban areas has become a core strategy in government efforts aimed at cleaning up past pollution while working towards a more sustainable future. While the initial attention of policy-makers in the 1980s focused narrowly on the risks posed by these potentially contaminated sites, the focus began to broaden in the 1990s to reusing brownfields in an effort to bring people, jobs, and taxes back to communities afflicted by deindustrialization. As the new millennium has unfolded, policy makers have expanded the socio-economic and environmental benefits that they hope can be gleaned from redeveloping brownfields, although the core objective still lies in the strategic reuse of these properties as locations for urban intensification to combat urban sprawl. That is brownfields as locations for growing “in and up” instead of out.

In Ontario, Canada’s most populous, industrialized, and brownfield-laden province, a suite of progressive government policies and programs have been introduced to not only facilitate the assessment and remediation of the brownfields supply, but to also steer development demand away from peripheral greenfields and towards brownfields through integrated planning and policy that considers a wider regional perspective.

Building on a paper presented at the ACSP last year, this poster presents the extent of property redevelopment that has taken place on brownfields in several Ontario cities (i.e., Toronto, Waterloo, and Kingston) since the provincial policy shift towards smarter growth. Using property assessment data and so-called Records of Site Condition submitted by those who assess and remediate brownfields, the specific questions guiding the examination are: How has brownfield redevelopment activity evolved in these three municipalities? What has been the scale, character, and value of redevelopment activity? What factors have contributed to the patterns of redevelopment? Can any broader implications be distilled from these cases in terms of supporting a more sustainable growth regime?

The results reveal that brownfields redevelopment has been extensive despite the fact that most matters related to site cleanup and development escape the authoritative reach of government. That is the province has established growth policies to be largely implemented by municipalities and remediation policies to be largely implemented by private sector companies with some potential support from municipal governments. Ontario's model, combined with a relatively strong real estate market bolstered by strong planning and growth management policy, has resulted in over 4,000 cleanups between 2004 and 2014 and a significant number of redevelopment projects. In the city of Toronto alone, 995 of the 1000 brownfield sites remediated between 2004 and 2011 have repurposed over 2,867 acres of land and resulted in projects valued at \$37.1 billion in property assessment, including over 83,000 residential units that house over 200,000 people. The smaller cities of Waterloo and Kingston have also fared well, although the concern is that the market can only do so much and that once the low-hanging fruit is redeveloped, municipalities and upper levels of government (including the federal government) will have to intervene more directly if they want to continue to target brownfields as places to grow smarter.

The research highlights the strengths and weaknesses associated with Ontario's approach, which lies in between the European and US models in that it focuses more on regional growth planning and less on site-by-site brownfields remediation and redevelopment. This research is of relevance to urban planners and policy makers interested in this domain of urban revitalization and redevelopment, as well as the strong cohort of planning scholars who have made a significant contributions to this field of research over the last two decades.

THE DISTRIBUTION IN THE SPACE OF URBAN ONLINE TAKE-OUT CATERING AND ITS FACTORS: A CASE STUDY OF SHANGHAI

Abstract ID: 775

Poster

GU, Qin [Tongji University] Qin_Gu@tongji.edu.cn, primary author
LUO, Zixin [Tongji University] 371942168@qq.com, presenting author

The emergence and development of China's online take-away catering market has greatly challenged the traditional spatial distribution pattern of the catering market. (Qin Xiao, Zhu Shoujia, 2014, Wang De, Wang Can, et al, 2015) Online take-away restaurants are ordered by mobile device, the food and beverage outlets are produced in a unified manner. The third-party delivery companies are responsible for food transportation. The networked, customer-oriented nature of the take-away catering service allows shop locations to no longer rely on customer density and traffic accessibility, which are of great importance in a traditional commercial layout.(Weltevreden J W J, 2007)

The traditional business location theory represented by central theories has a marked accumulation of commercial facilities, and the competitive advantage location is the main spatial logic of the traditional business site selection.

(Berry B J L, 1967) Online take-away shops are equipped with both dining-services function and food-production function. Along with this two functional attributes, the transportation of goods is handled by an independent third-party service company, and the transportation costs are borne by consumers. Therefore, the site selection for online take-away shops is mainly influenced both by the market location and rental cost of the shop location. The traditional business location theory is no longer fully applicable under the new online business service model.

Shanghai's online take-away catering market is representative, accounting for 12.5% of the country's total sales, and more than 60% of Shanghai residents have used online take-away catering services. By using Internet open data and official census data, the research uses Shanghai as an example to compare the spatial distribution characteristics of traditional restaurant sites and online take-out catering shop sites in Shanghai's main downtown area. Further, online take-out catering shop distribution is analyzed in both city scale and district scale. The research on the influencing factors of the shop sites shows: In the urban scale, online take-away restaurants are located far away from the traditional commercial centers of the city and clustered at the edge of the core business area, presenting the dual features of both space-flattening feature and center-network feature; at the scale of the block, online ordering platforms and third-party distribution teams are partially eliminated differences in the spatial location of restaurants in different locations. The rental cost and the spatial distribution of urban population are two great factors for the layout of online food shop sites. The study proposes that with the emergency of new online business models, the spatial layout of urban commercial facilities presents new spatial characteristics, and non-central urban areas can be functional renewed with online business platforms and low-cost cargo freight services.

THE IMPACT OF LOCAL NONFARM ECONOMIC DEVELOPMENT ON RURAL LABOR'S SPATIAL CHOICE OF NONFARM JOB

Abstract ID: 855

Poster

LIU, Yang [College of Architecture and Urban Planning, Tongji University] yangliuup@gmail.com, presenting author

Research question

Because of the large income gap between farm and nonfarm occupations, rural surplus labor tend to seek jobs in nonfarm sectors. As most of the nonfarm work opportunities are in the urban areas, large scale rural-urban migration occurs. However, few researchers have focus on the local side of nonfarm labor markets. With the development of local nonfarm economy, how will it affect rural labor's spatial choice of nonfarm job? Namely, the choice between local nonfarm employment and migration opportunities at different distances.

Approach and methodology

This paper takes "town" and "township" as the unit of analysis. The spatial choice of rural labor's nonfarm

employment are divided into 4 categories: home town; home county but outside of home town; home province but outside of home county; outside of home province. Using government statistical data of rural areas during 2012-2017, we calculated the rural labor's nonfarm employment as a proportion of total rural labor at the above 4 categories for each "town" or "township" in Jiangsu Province, which is located in the eastern coast of China and has large inner-province development disparities.

We separate the local nonfarm economic development into two levels and divide the research question into several sub questions:

(1) What is the impact of county center's nonfarm economic development on the rural labor's spatial choice of nonfarm job? What's the difference of that impact among towns with different locations?

(2) What's the impact of town-level nonfarm economic development on the nonfarm job spatial choice of rural labor in it?

We use multiple variables to measure the different aspects of local nonfarm economic development: economic structure, size of nonfarm economy, nonfarm job quantity, nonfarm job quality. With panel data from statistics yearbook of counties and towns, we developed a series of multinomial logit models to examine the impact of those aspects of local nonfarm economic development on rural labor's spatial choice of nonfarm employment, and the different impact across towns with different locations and development conditions.

Findings

(1) The nonfarm economic development of county centers will increase the proportion of rural labor working in the home county but outside of their original town, and this impact is larger for the towns which located near the county center than those located in relatively remote areas.

(2) For the towns located in developed counties, most of the rural nonfarm labor working in their home town, and the development of that town's nonfarm economy has positive impact on the proportion of rural labor's employment in the home town. But for those towns located in less developed counties, majority of the rural nonfarm labor work outside of the county but stay in their home province, and the improvement of town's nonfarm economy has little impact on the proportion of rural labor's local employment.

(3) For the towns located in developed counties, the improvement of nonfarm job quality will increase the proportion of rural labor working locally, but the increase of nonfarm job quantity's impact is insignificant. For the towns located in less developed counties, both the quality and quantity of nonfarm job has positive impact on the rural labor's local employment.

Relevance

The findings can increase our understanding of rural labor markets and how they interact spatially with migration opportunities. It will enable us to provide local nonfarm job opportunities for rural people in a more proper way; as well as to make better use of rural labor resource for the development of local economy. It can also benefit our understanding of the spatial trend of local population redistribution, which is closely related to the provision of local infrastructures, public services and housing.

IDENTIFICATION AND CATEGORIZATION OF U.S. BUSINESS DISTRICTS USING UNEMPLOYMENT INSURANCE DATA

MANDUCA, Robert [Harvard University] rmanduca@g.harvard.edu, presenting author

Understanding the built form that cities take is necessary for effective urban planning. One important facet of this is the spatial distribution of employment and residents within cities. The location of jobs and residents affects many aspects of urban life, from the type of transportation system a city will use to the likelihood of bonds forming between community members. In this paper I explore a particular question about the spatial patterns of employment: to what extent are jobs clustered into compact business districts, and to what extent are they spread at low densities throughout cities? Although most scholars agree that few cities today fit the monocentric model of one downtown surrounded by residents on all sides (Alonso 1964), there is debate about whether urban employment is best characterized as polycentric (Garreau 2011) or truly diffuse (Lang 2003).

I address this question using high-resolution employment data from the Census Longitudinal Employer-Household Dynamics (LEHD) project. The LEHD data is based on unemployment insurance records, and is able to give employment counts by Census block, a very fine geographical resolution. Using the LEHD data, I show that unlike residents, who form a continuous surface covering most parts of each Metropolitan Statistical Area (MSA), jobs have a bimodal spatial distribution, with most blocks containing no jobs whatsoever and a small number having extremely high employment densities. Across the 100 largest MSAs about 75% of jobs are located on the 10% of built land in Census blocks with at least twice as many jobs as residents. Further, most of these jobs are in clustered business districts with more than 10 contiguous employment blocks. These relative proportions are extremely consistent across metro areas, even though cities vary greatly in the physical density at which they are constructed.

Motivated by these empirical regularities, I introduce an algorithm to identify contiguous business districts and classify them into four major types, building on previous algorithms that combine data on population and employment (Forstall and Greene 1997; Shearmur and Coffey 2002). Based solely on the relative densities of employment and population, this algorithm is both simpler to implement and more flexible than many current approaches, requiring no metro-specific tuning parameters and no assumptions about urban form. The results show that although the overall allocation of land to employment and residential uses is fairly constant across the 100 largest MSAs, cities vary greatly in the way employment districts are constructed. In some cities traditional urban downtowns—many contiguous employment blocks at very high densities—continue to dominate the employment landscape. But other cities now find the majority of their jobs in areas of suburban sprawl.

In addition to producing shapefiles and maps of business districts, I am able to generate counts of employment by business district that are comparable across cities. Midtown, Manhattan, is the largest business district in the country, with just over 1.1 million jobs. The Chicago Loop is the second largest, at roughly 410,000, while downtown Washington DC is third with roughly 360,000.

These findings are relevant to both scholars and practitioners of urban planning. Many types of planning practitioners need to understand where jobs are located within cities. Transportation planners need this information to predict likely commuting patterns, while economic developers need to know which neighborhoods have ready access to employment and which ones suffer from a lack of opportunity. Academic research in urban planning requires systematic ways to identify concepts like a business district or a downtown core that can be applied consistently in different cities. The algorithms I develop offer one such approach.

E-commerce retail continues to grow in its share of total U.S. retail sales, now making up close to 10% of annual sales. This growth in online sales has many implications for urban planning. First, retail is a key generator of nonwork travel (Handy 1993), therefore changes in physical retail establishments or shifts in consumer behavior have important implications for transportation, both for the length and frequency of shopping trips and for the truck trips made to deliver online purchases. Second, retail is an integral element of urban design and can help promote areas that are walkable, bike and pedestrian friendly and have a strong sense of community and place (Chapple and Jacobus 2009). Finally, retail is an important component of economic development, particularly in California where property tax is fixed and sales tax is a crucial element of both municipal finances and transportation funding.

Existing research has begun to explore what e-commerce and changing retail dynamics may mean for personal travel and goods movement, but has overlooked the potential implications for both municipal finance and the built environment (Bruce et al. 2009). More information is needed to understand how e-commerce is impacting sales in local businesses and what those changes may mean for when and where retail establishments flourish. Though researchers note that the “death of retail” is highly exaggerated, the retail sector is seeing shifts in how firms operate in terms scale, location, and concentration of establishments (Hortaçsu, and Syverson 2015). This research seeks to understand how retail dynamics have changed in Southern California and highlight the implication for sales tax revenue and the built environment.

Since fine grained data on e-commerce are scarce, this research will use city-level California State Board of Equalization taxable sales data across the six county southern California region to examine longitudinal changes across nine retail categories. This will illustrate how sales patterns have changed between categories that are more or less susceptible to e-commerce substitution. This data will then be combined with longitudinal business establishment data from Reference USA to determine the relationship between the birth, death, and churn (Meltzer and Capperis, 2016) of retail establishments and taxable sales across our sample of nearly 200 cities. Using GIS and parcel-level land use data we evaluate the role of the type of retail land use (e.g. strip centers, regional malls, and town centers) involved in this dynamic. By linking the dynamics of physical retail businesses with taxable sales, this research will fill a gap in e-commerce research by providing an analysis of the changing retail dynamics in a region which contains 6% of the U.S. population. This work will help researchers and planners understand the relative stability of different retail types as it relates to tax revenues, neighborhood change, and related transportation impacts.

ROUNDTABLE: RESILIENCE - A NEW PATH FORWARD FOR CLIMATE CHANGE ADAPTATION?

Abstract ID: 220

Roundtable

SHI, Linda [Cornell University] lindashi@cornell.edu, moderator

MEEROW, Sara [Arizona State University] sara.meerow@asu.edu

ROBERTS, Bart [University of Buffalo] bjr8@buffalo.edu

COWELL, Margaret [Virginia Polytechnic Institute and State University] mmcowell@vt.edu

In the last decade, resilience has rapidly risen in prominence to become an important concept in urban planning practice and academic discourse. Large, high-profile funding opportunities such as the U.S. Housing and Urban Development (HUD) \$1 billion National Disaster Resilience Competition and the Rockefeller Foundations 100 Resilient Cities demonstrate the support and interest in resilience at the city scale. Increasingly, cities are using resilience rather than adaptation in the context of preparing for the impacts of climate change. The shift from adaptation to resilience may have important implications for how cities plan for climate change.

The concept of resilience has evolved in multiple disciplines, including ecology, engineering, and psychology, where it has different meanings. The “fuzzy” definition of resilience may allow it to bring together diverse actors that may not traditionally participate in climate change efforts. Resilience may also be better suited to reorient planning to address underlying causes of vulnerability than adaptation. However, there have been few studies on how resilience is translated into planning. As resilience emerges as a new planning domain, it is critical to not only characterize resilience plans but also understand how they differ from adaptation and other plans cities may adopt.

The panel combines academic thinkers who approach adaptation from different theoretical approaches with practitioners of climate adaptation. It seeks to understand from both pragmatic and critical perspectives the similarities, differences, and tradeoffs between resilience and adaptation. What are the benefits of framing efforts to prepare climate change as resilience? What are the drawbacks? How is resilience translated into practice? In light of the importance of climate change adaptation for cities, it is important to reflect on the pathways available to cities to prepare for climate change and the tradeoffs of these different approaches.

ROUNDTABLE: TOWARDS A MORE EQUITABLE REDEVELOPMENT FOR POST-HURRICANE MARIA PUERTO RICO

Abstract ID: 238

Roundtable

IRAZABAL, Clara [University of Missouri-Kansas City] irazabalzuritac@umkc.edu, moderator

CONTRERAS, Santina [The Ohio State University] santina.l.contreras@gmail.com

ENCARNACION, Angeliz [The University of Texas at Austin]

LAMBA-NIEVES, Deepak [MIT] deepak@grupocne.org

SANTIAGO, Luis [University of Puerto Rico] santiago.luis47@gmail.com

SIEMBIEDA, William [California Polytechnic State University, San Luis Obispo] wsiembie@calpoly.edu

In the wake of Hurricane Maria's destruction in late September 2017, the prevailing sentiment among Puerto Ricans is that the island is being left to its own devices. With a dramatically-slashed disaster relief loan, prolonged infrastructure issues (primarily with its aging electric grid), and ever-present island-wide budgetary issues, Puerto Ricans sense a concerted effort to empty out the island for a future development sans Puerto Ricans, especially given the pressures to leave the island (Meléndez & Vargas-Ramos, 2014). In this sense, the insufficient response to Hurricane Maria is viewed as an extension of numerous environmental and social injustices experienced by the island (Dietrich, 2011). Furthermore, Puerto Ricans' effective second-class citizenship and complex political status has further complicated recovery efforts (Vargas-Ramos, 2013).

Understanding how myriad relational injustices affect Puerto Rico's physical environment is the starting point for the discussion (Ranganathan, 2017). Roundtable participants will bring a diverse background of viewpoints through which the question of equitable recovery and reconstruction will be discussed. Perspectives (perhaps sometimes conflicting) from hazards planning, Latinx planning, and resilient urban design, among others, will inform debate on the following questions:

1. What would an "equitable" recovery and reconstruction look like for Puerto Rico?
2. What are the major barriers prohibiting equitable recovery and reconstruction post-Hurricane Maria?
3. What are promising Puerto Rican movements or similar case studies that provide positive models for recovery and reconstruction?
4. How can a recovery vision for Puerto Rico be constructed using community-based efforts supported by a mix of external support mechanisms?
5. How do you build a long-term disaster risk reduction strategy for Puerto Rico?

From this, the roundtable seeks to inform future research and action in Puerto Rico by highlighting the major barriers to equitable recovery and reconstruction after Hurricane Maria.

MOTIVE (MODEL OF INTEGRATED IMPACT AND VULNERABILITY EVALUATION OF CLIMATE CHANGE): THE PRESENT AND FUTURE

Abstract ID: 242

Roundtable

SONG, Young-Il [Korea Environment Institute] yisong@kei.re.kr, moderator
LEE, Suji [Seoul National University] sjstars7@gmail.com
SHIM, Changsub [Korea Environment Institute] marchell@gmail.com
SEO, Jihyun [Korea Environment Institute] jhseo@kei.re.kr
KIM, Haeryung [Seoul National University] loveholic@snu.ac.kr
YOON, Heeyeun [Seoul National University] hyoon@snu.ac.kr
YOON, Eun Joo [Seoul National University] youn01@snu.ac.kr
LEE, Dong Kun [Seoul National University] dklee7@snu.ac.kr

This forum intends to discuss the present and future of a research project that constructs the Model Of Integrated Impact and Vulnerability Evaluation of climate change (MOTIVE). MOTIVE began in 2014 as a 7-year project (2014-2020) along with the ‘National Climate Change Adaptation Plan’ (NCCAP) every 5-year term in order to minimize potential damages from climate change, secure national safety and property, and moreover turn it to be used as opportunities in Korea. Because establishing and implementing the adaptation plan in a cost-effective and efficient way requires reliable scientific information to figure out the impacts and vulnerabilities stemming from various climate change issues scientifically and assess adaptation measures applied. The main purpose of MOTIVE is similar to the modeling research around the world such as the Climate Change Integrated Metrology for Cross-sectoral Adaptation and vulnerability in Europe (CLIMSAVE), Joint UK Land Environment Simulator (JULES) of UK, and Integrated Climate Assessment–Risks, Uncertainty and Society (ICA-RUS) of Japan.

MOTIVE has supported numerous scientific measures on climate change adaptation effort of South Korea. This roundtable briefly introduces four research results that are found from diverse planning fields, which include public health, heat waves, forest firing and housing price, and land use adaptation options. After short presentations, participants and audience will discuss the current stage of this MOTIVE project and the future of this project to consider what is missing and needs to added. The main presentation topics include:

1. Health-MOTIVE: Health impact assessment tool for climate change (presented by Ho Kim; Suji Lee; and Soo Hyun Lee): Health-Motive is an easy to use health-effect assessment program aimed for use by decision makers in Korea as it complies with local government. The program includes a subset of recent data pertaining to air pollution (O₃, PM₁₀), climate (temperature, precipitation), demography, health (for example mortality and malaria data), and specific relative risks from a disease based on statistical analysis. Results are displayed in the form of tables, graphs, and maps with municipal-level divisions. The output from Health-Motive will be useful for policymakers and assist in designing appropriate public health policies to minimize the impact of future climate change on human health.
2. Projection of future hot weather and the potential population exposure in Korea (presented by Changsub Shim; Jihyun Seo; Jihyun Han): Heat waves, often caused by consecutive severe hot weather events, are responsible for the majority of the medical costs associated with climate change in South Korea. This study obtained a regional climate change scenario (RCP4.5) for South Korea, with a 7.5×7.5 km² horizontal resolution and extending up to 2100, by dynamically downscaling from the results of the Community Earth System Model (CESM) with the Weather Research and Forecast (WRF) model. By analyzing hot weather events (daily maximum temperature greater than 33°C) in the summer season (June–August), with a focus on changes in their extent and frequency, this projection of extensive hot weather events starting from the middle of the 21st century suggests the need for urgent government long-term measures and enforcement to ensure an early response to extreme weather events in Korea.
3. Forest Fire and Housing Prices - A Case Study of the Urban Forest Fire in Pohang city, South Korea (presented by Haeryung Kim and Heeyeun Yoon): Urban forest fire has become one of the disaster types that has drawn public attentions. The increasing dry weather condition by climate change induces larger and long-lasting forest fires. This research applied to revealing the effect of an urban forest fire on real estate market values using a case of Pohang city in Korea because in real estate markets, homebuyers’ perception of such natural disaster risk is reflected on housing values. It is expected to find out price discount effect for properties near urban forest fire, which could be applied for the preparation of countermeasures and the political decision making.

4. Land use adaptation options mitigating climate change impact (presented Eun Joo Yoon and Dong Kun Lee): Climate change adaptation has been addressed only at the policy level, while relatively little is known about how to change the actual space composition to adapt to climate change. The study intends to suggest land-use adaptation options based on multi-objective genetic algorithms that are the most popular optimization tool in addressing multi-objective problems in land-use planning, and also provide immediate feedback to stakeholders. Considering the flexible structure of the optimization model, it is expected that stakeholders can generate other land-use options efficiently by adjusting certain model parameters, such as the weighting combination, and select options depending on their preference to address relevant problems.

ROUNDTABLE: AN ENVIRONMENTAL PLANNING FOR THERMAL EXTREMES - BUILDING CAPACITY FOR A SMART AND CONNECTED APPROACH TO CREATING MORE COMFORTABLE CITIES

Abstract ID: 576

Roundtable

COSEO, Paul [Arizona State University] pcoseo@asu.edu, moderator

HAMSTEAD, Zoe [University at Buffalo, The State University of New York] zoehamst@buffalo.edu

SHANDAS, Vivek [Portland State University] vshandas@pdx.edu

VERDUZCO, Vivian [Sonora Institute of Technology] vivian.verduzco@gmail.com

This roundtable examines capacity building approaches for management of thermal extremes. City officials are increasingly creating agendas that pursue both smart city initiatives and environmental planning policy related to thermal extremes (both hot and cold). Yet, it is unclear as to how the two agendas may improve the quality of our urban thermal environment and for whom. As the nation's leading cause of weather-related deaths, extreme heat and cold substantially impact human well-being in the United States. The impacts of heat and cold are unevenly distributed in urban areas as a result of variability in infrastructure and social factors that influence risk.

Regardless of season, not everyone who lives in a city experiences thermal extremes in the same way (Huang et al., 2011). For example, variations in human thermal comfort among city neighborhoods can be greater than the difference between a city and its surroundings. Even within neighborhoods, landscape differences and indoor thermal comfort variations between households likely result in uneven thermal exposure. In addition, personal health, access to health services, economic status, and demographic factors can modify a person's capacity to cope with thermal extremes (Gronlund et al., 2016). Many different agencies, organizations, and individuals are involved in the management of extreme heat and cold events through a wide range of preparedness and response activities. Improved coordination of actions and utilization of data resources would increase the return on public and private investments made to minimize adverse impacts of heat and cold and lead to reduced instances of weather-related mortality, morbidity, discomfort, and lost productivity. Grimmond and colleagues (2010: 259) suggest agencies have a high “[n]eed to develop tools that allow assessment of the best, or the ranking of, social,

economic and environmental decisions for urban climate management”. To date, urban climate or thermal management has been a nebulous concept in practice (Stone, 2012), and understanding what cities are doing is critical to developing an environmental planning for managing thermal extremes. The management of the thermal environment involves addressing both physical and social exacerbators of thermal comfort (heat/cold), which includes physical infrastructure along with community resources available to help people deal with those extremes. This roundtable convenes experts from different bioclimatic regions working with government agencies on a broad framework for management of thermal extremes. The purpose of the roundtable is to:

1. identify information gaps, who needs what data, and the feasibility of an environmental planning for thermal extremes;
2. provide examples of university-city environmental planning processes for managing thermal extremes in different bioclimatic regions; and
3. discuss challenges and opportunities for advancing an environmental planning for thermal extremes.

WALSH, Elizabeth [University at Buffalo, The State University of New York] elizabeth.walsh@gmail.com

As the centerpiece of the Obama Administration’s Partnership for Sustainable Communities (PSC), HUD launched SCI in June 2009. Perhaps one of the federal government most ambitious regional and urban planning experiments, SCI sought to infuse principles and policies of equitable development and sustainability through a series of regional planning grants, sustainable communities challenge grants and a robust suite of capacity building activities. With only 2 years of congressional funding, SCI allocated more than \$250 million through 143 grants and leverage an additional \$175 million of additional public and private funds. The SCI experience offers important lessons in capacity building, sustainability, and collaborative planning. Our roundtable will examine SCI’s legacy and explore how future governmental agencies, nonprofit institutions, philanthropy and community-based organizations could adapt the SCI model. Many of the proposed participants in this roundtable are authors of articles that appeared in the November 2017 special edition of HUD’s *Cityscape Journal* devoted to SCI and planning livable communities.

PRE-ORGANIZED SESSION SUMMARY

PLANNING AND DESIGN WITH URBAN TREES AND GREEN SPACE: STRATEGIES, BENEFITS AND CHALLENGES

Summary ID: 26

Abstract ID: 401

Abstract ID: 402

Abstract ID: 403

Abstract ID: 404

Urban ecosystems play an essential role in achieving some of the main goals of urban planning and design such as sustainability, climate change adaptation and mitigation, and public health in high density urban areas (Gómez-Baggethun & Barton, 2013). To study ecosystem services, both scientific modeling and policy analysis should be conducted together for informing planning and design regulations. Studies show that urban green vegetation can mitigate urban heat, air pollution, and storm water (Lovell & Taylor, 2013). Our session includes a range of explorations of urban green infrastructure, its benefits, and its costs. Presentations in this session discuss the impacts of trees on heat mitigation and thermal comfort. We also discuss how trees and tree planting initiatives can mitigate air pollution. In addition to exploring the air quality and microclimate benefits of trees, we explore the impact of trees on outdoor water usage. The presentations in this session come together like pieces of a puzzle to paint a big picture of costs and benefits of urban trees and surface vegetations.

Objectives:

- To discuss the impact of urban trees on mitigating air pollution and urban heat
- To discuss the dependency of trees on active irrigation as well as reducing water usage in relation to surface vegetation maintenance
- To explore how planning and design policies can address the above objectives and their complexities

QUANTIFYING THE CONNECTION BETWEEN URBAN LAND USE AND WATER USE - SCENARIO BASED PLANNING FOR WATER BUDGETS DURING TIMES OF SCARCITY.

Abstract ID: 401

Group Submission: Planning and Design with Urban Trees and Green Space: Strategies, Benefits and Challenges

FOLLINGSTAD, Gretel [University of Colorado Denver] gretelfollingstad@gmail.com, presenting author

This research contributes to water resource resilience planning, to increase community scale capacity to prepare, plan, absorb, recover from and adapt to the effects of our changing climate on water supplies (Cutter, Burton, & Emrich, 2010). Acknowledging that increasing population densities in urban areas create greater vulnerability, there is also an opportunity for community-scale changes that can mitigate these impacts. While not all hazard risks can be avoided, mechanisms should be in place to minimize effects. To address these circumstances, this paper explores the determinants of urban water use by modeling urban tree transpiration and comparing those results with water use data for the City of Denver. From a water management perspective, understanding transpiration rates of urban trees is fundamental to improving the selection of water-conserving species (Bush et al., 2008). Moreover, efficiencies in water use, infrastructure and land uses are essential for resilient urban development and redevelopment, thus linking urban forests and their ecosystem services to the planning and management of water. This study will inform sustainable urban land use design, as a key component to building resiliency into natural resource planning and mitigating the effects of water scarcity and drought events.

The primary research question is: Will creating a drought tolerant urban forest composition improve urban forest water use efficiency and improve resilience to drought events? I hypothesize that modeling transpiration rates of various tree species in the Denver Urban Forest will allow for improved decision making on tree replacements that require less irrigation; while improving water resource resiliency in times of drought.

This study interprets the extent to which outdoor irrigation drives urban water demand and models the capacity of changing landscaping practices, particularly those involving non-native trees and woody vegetation, to make up for diminishing municipal water supply. In doing so, I will analyze best practices in urban landscape irrigation needs and regulations for cities across the US West (Gober, Sampson, Quay, White, & Chow, 2016; Hale et al., 2015).

Methods:

Estimates of species specific tree transpiration rates will be derived using an empirical model called Etree (Litvak, McCarthy, & Pataki, 2015). The parameters within Etree will be modeled in ArcGIS. The Etree variables are derived using open data sources:

- FEMA LIDAR (2015) DSMs (digital surface models),
- Denver Tree inventory (over 200k trees; Denver Parks & Recreation 2015)
- Local weather data (Wunderground PWS)

This is a less robust, but more user-friendly approach to determining urban tree water use. The transpiration values are then assigned to each tree within Denver's urban tree inventory (using Arc GIS). The second phase of the study compares the transpiration rates of the tree inventory species with water use data from Denver Water to gain a clearer understanding of outdoor irrigation of trees by species. This analysis informs tree replacement strategies to create an urban forest that requires less irrigation water. Together, these results are used in scenario planning for variations in weather extremes and the effects of changes in water supply on urban ecosystems. While many Western cities have water conservation programs and municipal regulations used in times of scarcity (Mansur & Olmstead, 2012), apart from some arid southwestern cities (Holway, 2009), most urban areas don't have strict landscape ordinances. The results of this study will contribute to drought resilient land use policies and ordinances for open spaces and parks and landscaping guidelines for new developments.

DEVELOPING AND EVALUATING A SPATIAL DECISION SUPPORT TOOL FOR AN URBAN GREENING ORDINANCE

Abstract ID: 402

Group Submission: Planning and Design with Urban Trees and Green Space: Strategies, Benefits and Challenges

TROY, Austin [University of Colorado Denver] austin.troy@ucdenver.edu, presenting author

Denver voters recently passed a green roof ordinance ballot measure that is among the most far-reaching in the country. Initially written to require developers of new buildings greater than 25,000 square feet to install either green roofs or solar panels on a portion of the roof, since its passage the city has empaneled a group of experts to modify the law to make it more flexible. Specifically, the law is being adapted to allow for a variety of different possible greening strategies on properties beyond just green roofs, with the understanding that at many sites not only are green roofs cost-prohibitive, but lower-cost greening solutions may actually be far more effective, such as planting of trees and other vegetation at grade, among many others. If this approach is followed, the result would be nationally groundbreaking: a general greening ordinance that requires all new buildings to adopt some menu-based greening strategy that is most suitable for the site and that meets some minimum point total. The question remains, however, how to determine at each site which type of green investment is most suitable and most needed, from the perspective of the tentative suite of desired benefits articulated by the working group: mitigating urban heat, stormwater, and climate change; and maximizing green amenity value. Ideally, a tool could be developed that would help commercial land owners select the most appropriate greening practices for their sites, and help city managers simulate how the urban landscape might look and function after those choices were ultimately implemented.

Previous spatial decision support tools have been developed to help in optimally siting urban trees (Locke et al. 2010, Morani et al. 2011) as well as in evaluating the flow of ecosystem services from urban green infrastructure under different spatial scenarios (Kremer et al. 2016). Building on these previous techniques and based on the author's advisory work with the Denver ordinance working group, this paper describes a methodology that would automate the determination of which greening practices would be acceptable under the ordinance at each commercial parcel, based on a menu of acceptable practices (e.g. tree planting, green roofs, green walls, rain gardens, pervious pavement, etc). Not only would this approach identify minimum required actions, but in cases where multiple approaches are allowed, it would also identify the practice that would be most cost-effective in achieving the goals mentioned above.

It does this by classifying urban parcels based on suitability, additionality, and benefits maximization. The suitability dimension considers factors like the amount of available planting space at grade, based on the concept of "potential and realized stewardship" area (Troy et al. 2007), with the understanding that expensive green roofs or walls would be reserved for parcels with minimal at-grade planting opportunities. The additionality dimension considers what green elements already exist, using LiDAR and other remote sensing data, to ensure that any investments do not replace, but rather reinforce and add to existing green infrastructure. The benefits maximization dimension considers how to maximize the provision of the environmental benefits mentioned above for locations where there is high need. Based on these GIS algorithms, commercial parcels in the city of Denver are classified based on their ideal greening strategy and areas/counts in each category are totaled, in support of that city's nascent ordinance. The same is then done for Baltimore, an eastern city with very different urban morphology and no such ordinance and results are compared in terms of how many parcels and how much area is classified under each greening strategy in each city.

HOW SHOULD LANDSCAPING REGULATIONS OF DESIGN GUIDELINES AND ZONING CHANGE TO ACCOMMODATE HEAT MITIGATION STRATEGIES?

Abstract ID: 403

Group Submission: Planning and Design with Urban Trees and Green Space: Strategies, Benefits and Challenges

HERIS, Mehdi [University of Colorado Denver] mehdi.heris@gmail.com, presenting author

Urban heat is being intensified by climate change impacts. While urban heat island effects make cities warmer than their surroundings, extreme heat events will be more frequent and intense in the changing climate. To make cities more resilient in the face of such events, a series of integrated social, environmental, and physical planning efforts is required. Urban trees and climate responsive urban design can improve urban microclimate variables.

Our knowledge of how built form elements, including trees, mitigate urban heat is still evolving. Studies with high accuracy measurements and simulations of microclimate variables show that trees mitigate site scale ambient temperature up to 1°C (Middel et al., 2014). Although ambient temperature might not be dramatically affected by trees, thermal comfort and mean radiant temperature (MRT) can be significantly improved by trees (Lindberg et al., 2008).

The literature on planning and design policies addressing urban heat is still very thin. One area that is fairly well discussed is cool roof policies that are adopted in building codes (Rosenfeld et al., 1995). Furthermore, cities in hot and arid regions have started to adopt heat strategies in their climate action plans. Nevertheless, climate action plans are mostly advisory and they are not connected to regulatory planning and design tools. In this regard, zoning and design guidelines are the baseline for shaping the built environment form. This includes landscaping regulations managing private development projects (Punter, 1999).

The main research question here is: how should planning and design regulatory tools be modified for creating a more climate responsive urban form. To answer this question, I analyzed two urban redevelopment projects (Belmar in Lakewood, CO and 29th St Mall in Boulder, CO) in the Denver metropolitan area. Given that in both projects heat mitigation strategies were not adopted intentionally, the regulatory systems in both sites were scrutinized to understand how different choices affected urban microclimate. I used ENVI-met and SOLWEIG simulation models to simulate microclimate variables such as wind circulation, ambient temperature, and mean radiant temperature. To compare the heat performances, five policy scenarios were developed for comparison of policy choices in both sites. To explore planning processes and institutional differences, I interviewed the main stakeholders of both projects including city staff, developers, designers, city council members, and engaged citizens.

The results show that landscaping choices in Belmar performed more effectively in heat mitigation. Although the ambient temperature was not strongly affected by trees and built form elements, mean radiant temperature was

mitigated by trees and landscaping regulations. In Belmar, using trees to create a more walkable space was a core value. The developer planted mature trees, instead of small trees which would have had a lower survival rate. Also, I found that form-based zoning along with PUD (Planned Unit Development) that was used in Belmar provided a better foundation for fine scale landscaping regulations. Form-based code has a modular structure and landscaping codes were built in as a part of the main planning code. Trees and landscaping in Belmar can mitigate urban heat more effectively compared to 29th St in Boulder, CO. Design choices that made Belmar more successful in heat mitigation were made to achieve walkability and mixed-use urban center objectives. The zoning regulations in Boulder do not provide a structure for adopting fine-scale site regulations. Reviewing the planning process in both sites show that a regulatory framework that can accommodate fine-scale landscaping regulations, such as form based code, provides a better foundation for heat mitigation.

ADDRESSING AIR POLLUTION WITH URBAN TREES: OPPORTUNITIES AND REGULATORY BARRIERS IN DETROIT, MICHIGAN

Abstract ID: 404

Group Submission: Planning and Design with Urban Trees and Green Space: Strategies, Benefits and Challenges

LARSEN, Larissa [University of Michigan] larissal@umich.edu, presenting author

In 2009, the U.S. Environmental Protection Agency (EPA) estimated that 45 million people live, work, or attend school within 300 feet of a major roadway (4 or more lanes), a railroad yard, or airport (<http://www3.epa.gov/otaq/nearroadway.htm>). This statistic means that 14% of the US population is exposed to elevated air pollutants (using a current population estimate of 321,000,000). The primary air pollutants from vehicles (including diesel engines) are PM_{2.5} and NO_x. Elevated levels of these pollutants from cars, trucks, and other motor vehicles have human health impacts that include increased asthma onset and aggravation, impaired lung development in children, and more frequent early term or low birth weight babies (Finkelstein et al. 2004, Boehmer et al. 2013). While changes in the vehicle efficiency standards have lowered air pollutant levels, the EPA hopes to use tree buffers along roadsides to reduce air pollution concentrations. The positive aspects of trees extend beyond aesthetics to social and environmental benefits. Some environmental benefits include decreasing the urban heat island, increasing the probability of on-site stormwater retention, providing habitat, and mitigating air pollution (Larsen, 2015). Despite the announcement of significant tree planting programs in many North American cities, Nowak and Greenfield (2012) determined that many U.S. cities are losing their tree canopy. Over a five-year period, the urban canopy decreased in 17 of 20 U.S. cities. Detroit lost approximately 3.5% of its tree cover while its percentage of impervious surface increased between 2005 and 2009. Detroit's tree canopy of 16.5% is well below guidelines for temperate cities. The specific approach that I used in this project was based upon a similar analysis conducted for New York City in 2011. Unlike Morani et al., I used only PM_{2.5} and NO₂ criteria pollutants. First, in this presentation the audience will learn about how I combined air pollution data with demographic data in Geographic Information Systems (GIS) to prioritize tree planting locations. Second, the audience will learn what specific city and state regulations block tree planting along

roadways. Finally, the presentation will end with a summary of how I, working with a group of graduate students, am trying to change these regulations.

PRE-ORGANIZED SESSION SUMMARY

GROUP SUBMISSION: PUERTO RICO AND HURRICANE MARIA: PLANNING FOR A JUST, EQUITABLE AND SUSTAINABLE RECOVERY

Summary ID: 38

Abstract ID: 625

Abstract ID: 626

Abstract ID: 627

Abstract ID: 1263

On September 20, 2017, Maria, a category 4 hurricane with sustained winds of over 140 miles per hour, devastated the island’s infrastructure, transportation network, agriculture, natural environment, housing, and communications systems. Help was slow in reaching the island. Puerto Rico as an unincorporated territory of the U.S. qualifies for FEMA Assistance. However, with a poverty rate nearly double that of Mississippi, failing infrastructure that has been neglected for more than a decade and a public sector that has been increasingly dismantled in response to the debt crisis of over \$72 billion, the island was already in a state of emergency long before the storm hit. A week after Hurricane Maria, when it was clear that the preparations Puerto Ricans had taken were inadequate, San Juan Mayor Carmen Yulín Cruz stated in a press conference: “We are American Citizens; we can’t be left to die.” A number of actors, from the government to the grassroots have proposed solutions, but do these solutions promote resilience and sustainable development? How can recovery be effective and equitable? The purpose of this panel is to lay the foundations for such inquiries.

Objectives:

- Learn about pre-existing conditions of communities in Puerto Rico, the impact of the hurricane, and recovery trajectories.
- To identify built environment and infrastructure challenges faced by disaster-affected communities of Puerto Rico that require an sustainable, equitable and just approach to address them.
- To understand the socio-ecological-technical nature of these challenges through an interdisciplinary examination of their historical antecedents, concurrent recovery issues, as well as the needs and desires of local communities.

RELATIONAL APPROACH TO ENVIRONMENTAL INJUSTICES IN PUERTO RICAN RECOVERY

Abstract ID: 625

RIVERA, Danielle [University of Colorado Boulder] danielle.rivera@colorado.edu, presenting author

In the literature on environmental justice, an “injustice” has historically been defined as the maldistribution of risks, reflecting a distributive justice framework (Bullard, 1990). However, a number of environmental justice scholars have recently called for new approaches to theorizing “justice” that merge environmental justice research with more expansive justice theories (Jacobs, 2018; Ranganathan, 2017; Schlosberg, 2007). These perspectives, in the words of Malini Ranganathan (2017), take justice first and environment second, emphasizing the systemic sources of environmental racism.

This paper presents an experimental study conducted in Northern Puerto Rico in 2017 and 2018 to understand the physical planning issues facing Puerto Rican communities after Hurricane Maria through a relational justice lens. This framework for examining the immensely fraught reconstruction of Puerto Rico takes into account its colonization, suppression of indigeneity, mass migration, debt concerns, and second-class citizenship (Dietrich, 2011). The work constitutes an early exploration into a long-term project examining Puerto Rican reconstruction efforts and community organizing.

The paper ultimately highlights the benefits of using a relational justice framework for analyzing environmental justice in post-disaster Puerto Rico, highlighting key aspects of this approach and how it alters narratives around disaster response. Placing the issues within a wider historic narrative and understanding the role of the diaspora becomes central to the discussion, particularly given Puerto Rico’s fraught relationship with the United States mainland. Ultimately, the paper joins in other similar calls to center environmental justice studies within historical contexts and relational frameworks (Jacobs, 2018; Ranganathan, 2017).

POVERTY, INEQUALITIES AND THE STATE: AN OLD TALE THAT HURRICANES IRMA AND MARÍA REVEALED TO WORLD IN AN UNEMBELLISHED FORM

Abstract ID: 626

Group Submission: Puerto Rico and Hurricane Maria: Planning for a Just, Equitable and Sustainable Recovery

ENCARNACION, Angeliz [The University of Texas at Austin] encarnacion.angeliz@utexas.edu, presenting author

Many scholars have highlighted the inextricable link between poverty, hazards and disasters (natural and human-caused) that results in unequal burdens across vulnerable populations (poor, homeless, and others). Yet, unpacking how “processes of systemic oppression” set these communities at the forefront of these events aftermath, remains an important task in the disaster planning literature (Jacobs, 2018). Hurricanes Irma and María stroke Puerto Rico in September 2017 exposing the visible traces of economic and social inequalities in an unembellished form. Accordingly, the University of Puerto Rico Census Information Center at the Cayey campus (2017) estimated an 8.8 % increment in the island-wide poverty rate (from 43.5 % to 52.3 %). The existence of

chronic poverty and inequalities in Puerto Rico is not new, but it has been excluded from the official discourse and debates at the federal and state level for many decades (Colon Reyes, 2005; Rivera, 2017). The effects of the recent disasters offer a prime opportunity to explore the role of the state historically and the way that institutional structures (including the Puerto Rico Planning Board) have managed poverty and inequalities conflicts. In this context, this paper aims to trace back the systems of oppression that deny vulnerable populations the right to be prepared, protected and to recover from catastrophes. The research is based on an historical institutional analysis that contextualizes to what extent and in what ways hurricanes Irma and María exacerbated inequalities. This historical analysis is significant for the formulation and implementation of equitable reconstruction plans lead by Puerto Rican authorities and will also contribute to envision new directions for disaster planning research agenda.

FORCES ON THE GROUND: DISASTER RECOVER(IES), PLANNING AND THE GRASSROOTS

Abstract ID: 627

Group Submission: Puerto Rico and Hurricane Maria: Planning for a Just, Equitable and Sustainable Recovery

TORRES-CORDERO, Ariam [University of Illinois at Urbana-Champaign] ariamlt2@illinois.edu, presenting author

On September 2017, Hurricanes Irma and María struck the islands of Puerto Rico (PR), causing catastrophic damage and triggering what has been described by US and international media as a humanitarian emergency. Hurricane María (HM) has been recorded as the worst natural disaster in PR's history, crashing virtually the entire electric power grid and all communication systems, while wrecking much of the islands' infrastructure. For weeks, PR remained isolated, uncommunicated, and almost completely dark.

Reflections about PR's disaster recovery processes after Hurricanes Irma and María signal a growing distance between the government-led recovery endeavors and underserved populations' struggle to survive and recover. For months, the islands' state government operated in emergency mode, struggling to do even the essential: save lives, clear roads, provide clean drinking water and restore the electric power grid. Concurrently, many local residents organized at a grassroots level to help vulnerable populations that government-sanctioned recovery efforts ignored. Whether pooling resources to collect and distribute food, water and electricity, or creating brigades to clear pathways and help rebuild houses, many residents have engaged in recovery processes that are placed almost entirely outside the purview of the state.

Grassroots recovery practices have served as recovery infrastructure, providing access to basic survival needs, materials for reconstruction, and developing a communication structure, including social media (i.e., Facebook and Whatsapp), to connect people from all over the islands and the US mainland. This brings us to ask: how do these practices relate to official or government-sanctioned recovery endeavors? How do both "separated" processes speak to each other? To what extent disaster recovery researchers and planners identify, understand and engage with grassroots recovery practices?

Disaster recovery literature only provides a partial view of a plural, complex, fast-changing and to some extent contradictory processes. Little attention has been paid to understanding and engaging with communities and grassroots recovery practices that occur almost entirely outside the purview of official, sanctioned processes. Further, little attention has been paid to the points of intersection between unofficial – and sometimes unsanctioned– processes and the government-sanctioned recovery work. As such, and since there is no consensus on what ‘recovery’ means (Olshansky & Chang, 2009), and no “grand theory of post-disaster recovery” (Olshansky et al., 2012, p. 177), this research sets out to explore and engage with different configurations of recoveries, as described by different grassroots groups and underserved populations.

This research is an ongoing multi-method ethnographic attempt to advance disaster recovery scholarship, responding to the field’s need for case studies and ethnographic qualitative data. Through an inductive qualitative approach, we analyze PR’s disaster recovery processes as an effort to allow context to drive not only descriptions of the multiple recoveries but also to interpret the empirical findings. Our methods include ongoing interviews with leaders and members of several grassroots recovery groups and community-based organizations, participant observation and involvement in Puerto Rican diasporic organizing in U.S. mainland, virtual participant-observer reflections based on pictures and videos posted on social media, online archival research – including academic studies and government reports – and news media.

Preliminary findings suggest that people operating as recovery infrastructure are necessary in post-disaster environments. For example, one grassroots group reached more than 100,000 people across 45 municipalities (out of 78) within five months of HM. Grassroots recovery groups have also proven to be flexible in terms of recruiting different volunteer bases and changing “mission” objectives, depending on the changing needs of people. Preliminary findings also suggest that certain grassroots formations are able to maneuver outside political and bureaucratic structures to secure ready supplies that get stuck in logistical bottlenecks.

INTEGRATING GENDER EQUITY INTO SMALL-SCALE COFFEE FARMING AND LIVELIHOOD RECOVERY IN POST IRMA & MARIA PUERTO RICO. RAMÓN BORGES-MÉNDEZ, PHD & CYNTHIA CARON, PHD.

Abstract ID: 1263

Group Submission: Puerto Rico and Hurricane Maria: Planning for a Just, Equitable and Sustainable Recovery

BORGES-MENDEZ, Ramon [Clark University] rborgesmendez@clarku.edu, presenting author

In light of ecological uncertainty and economic stagnation, the current post-disaster context in Puerto Rico provides an opportunity to think strategically about the coffee sector’s reconstruction and socially inclusive growth that would focus on the role of women not just in production, but also all along the coffee supply chain and within the coffee regional economy. In most of the world, including Puerto Rico, small-scale farmers produce 70% of the coffee supply. A high percentage of small farmers and field, and sorting workers are women (up to 90% in some African countries). In the coffee supply-chain, however, women are typically concentrated as disadvantaged producers at the bottom of the chain, earn very low wages, occupy few leadership positions in

commercial operations, in addition to performing unpaid work in rural households. Given the fundamental role women play in small coffee farming and production, we will investigate ways to integrate women into the multifaceted process of reconstructing the coffee local and regional economy in PR. Taking a feminist line of inquiry is fully compatible with international standards and practices in agricultural livelihoods, disaster mitigation, and local/regional development planning research.

In 1898, Puerto Rico was the 6th largest coffee producer of the world. Throughout the 20th century, however, due to the expansion of sugar-cane monopoly agriculture, urbanization, natural disasters, and misguided agricultural policies, local production has declined. Nevertheless, in 2012 coffee was the fifth most important revenue stream Puerto Rico's agricultural GNP. The coffee industry now faces additional setbacks following hurricanes Irma and Maria, which damaged almost half of the coffee trees in the coffee region of the island. The coffee region (and industry) is geographically located in the central-west highlands of the island, specifically in ten contiguous municipalities, which are also some of the poorest in the island. Some of these municipalities, show pre-Maria unemployment rates close to 25%, which have been steady for almost a decade. The inability to produce a significant coffee harvest over the next decade will exacerbate the current fiscal crisis of the coffee region, the island's overall economy and maintain poverty levels for rural coffee small holders--already under siege by monopolistic consolidation in the industry by multinational companies. Reconstruction of the coffee industry also is under threat by climate change. Warming and drying trends are likely to accelerate after 2040 and could result in top producing municipalities losing 60-84% of their production suitability by 2070. In our research, we expect to identify programmatic opportunities that would facilitate collaborations between universities in PR with other universities in the mainland, as well as with US Federal Government agencies such as USDA, FEMA, NSF, NIFA, NOAA.

For Prof. Caron, this project brings two of her research foci together. She has examined gendered relations of land access and agricultural productivity in India, Zambia, and Uganda. This project would allow her to compare and contrast her feminist analysis of banana value-chains in Uganda to that of coffee. Secondly, this research on how disasters present opportunities to 'build back better' aligns with her on-going research on post-disaster recovery and reconstruction following the 2004 Indian Ocean tsunami. For Prof. Borges-Méndez (a native of Puerto Rico), first, this research is natural extension of his long-standing policy work on the impact of the 2008 recession and of the intensification of the Puerto Rican debt crisis on Puerto Ricans in the mainland and the island. Secondly, this research represents a direct professional and personal commitment to improve the prospects of reconstruction efforts in the island, especially of food systems (dairy and coffee), and of economic development pathways for the debt-ridden economy of the island.

PRE-ORGANIZED SESSION SUMMARY

CLIMATE CHANGE AND ENVIRONMENT MODELING I: MODEL OF INTEGRATED IMPACT AND VULNERABILITY EVALUATION OF CLIMATE CHANGE (MOTIVE)

Summary ID: 41

Abstract ID: 710

Abstract ID: 711

Abstract ID: 713

While causes and effects of climate change are complicated within both our ecological and socio-economic systems, it is clear that we are being influenced to our daily activities. Various direct/indirect and visible/invisible impacts of climate change appear broadly in the form of natural disasters, water resource shortage, and poverty, increasing threats to every sector at all the levels of global, regional, national and local governments. Based on the research projects conducted with the Model Of inTegrated Impact and Vulnerability Evaluation of climate change (MOTIVE) launched in 2014 as a 7-year project (2014-2020). The MOTIVE work is similar to the various global modeling research such as CLIMSAVE and JULES of UK, and ICA-RUS of Japan. Based on the main objectives that are to develop an integrated model evaluating the impacts and vulnerabilities of climate change and support the initiation of scientific measures on climate change adaptation effort of South Korea, this session provides various research findings conducted. This session can contribute to successfully establishing a new MOTIVE-type adaptation measure model for the US and other countries.

Objectives:

- Global climate change and local environmental and adaptation modeling
- Multi-disciplinary collaborative modeling practice

MEASURING PROBABILISTIC ECONOMIC IMPACTS STEMMING FROM VARIOUS DISASTERS ASSOCIATED WITH CLIMATE CHANGE: APPLYING THE KOREAN FLEXIBLE ECONOMIC MODEL

Abstract ID: 710

CHO, Dongin [University at Buffalo] didi9535@gmail.com, presenting author

PARK, JiYoung [University at Buffalo, The State University of New York] jp292@buffalo.edu, co-author

This study suggests a new framework that empirically quantifies the future, long-term economic impacts of various potential risk events stemming from climate change in South Korea. Assessing the long-term economic risk impacts has been one of most challenging work because of various limited modeling methods. For example, a key limitation of classic Input-Output (IO) model include fixed coefficient matrix in IO which makes no substitution effects. Utilizing secondary data, including various scenarios, the framework is used to identify the technological changes in production that adopt simulated results stemming from a major disaster. Gordon et al (2009), Park and Richardson (2014), and Park et al. (2017) suggested a new, innovative approach to constructing unknown IO coefficients of the future. The approach could successfully be built on both the demand- and supply-driven models, advancing the RAS method and estimating a new coefficient matrix. This approach is a resilient IO model that reflects substitution effects and understood as a quasi-dynamic economic impact model. Required data set to meet the target for the future assessment include an updated, new input-output table consisting of final demand and value added in the target year and input data for specific events related with climate change in the future. Based on the datasets prepared and socio-economic scenarios developed by Korea Environment Institute, this study analyzed a research question: what are the probabilistic economic impacts of health and social work industry sector stemming from Heat Wave? Years targeted are 2030 and 2050. This new framework, which provides estimates of economic impact adaptation process and resilient results, refines the often substantially overstated impacts provided by the application of conventional economic models. Findings include the followings: 1) the industry with which large losses are expected is Wholesale and Retail Trade; 2) if considering the entire scenarios, the Agricultural, forest, and fishery goods sector may experience larger losses in 2050; 3) in the future scenario cases, because socio-economic systems that recover direct losses quickly in the health and social work sector can be introduced, the effect on other industries may reduce; 4) this is also similarly found from low Type 1 multiplier that shows the effect to the losses in other industries diminishes, implying that a resilience society is expected to appear in the future.

A STUDY ON THE IMPACT OF CLIMATE CHANGE ON THE RICE FARMING SYSTEM IN KOREA USING SYSTEM DYNAMICS MODELING

Abstract ID: 711

Group Submission: Climate Change and Environment Modeling I: Model Of inTegrated Impact and Vulnerability Evaluation of Climate Change (MOTIVE)

CHO, Kijong [Korea University] kjcho@korea.ac.kr, presenting author
KIM, Yongeun [Korea University] kyezzz@korea.ac.kr, co-author
LEE, Minyoung [Korea University] alsdud514@korea.ac.kr, co-author
HONG, Jinsol [Korea University] jinsol9005@korea.ac.kr, co-author

Changes in agricultural systems due to climate change are one of the most important issues in the world in terms of food security (Challinor et al., 2014). In particular, since rice is a major crop used as a staple diet by nearly half of the world's population (Gibson and Kim, 2013), it is necessary to predict and manage the sustainability of the rice farming system to cope with climate change. To analyze the impact of climate change on the rice farming system, a comprehensive approach is needed that takes into account socio-economic and environmental changes as well as crop productivity (Rasmussen et al., 2012). Therefore, in this study, a system dynamics model including the main components of the rice farming system and their feedback effects, was developed and plans for maintaining the sustainability of the system were suggested. The system dynamics model is comprised of five major sectors such as rice production, water resources, cultivated area, economic factors, and soil fertility, and net income, irrigation and crop productivity connecting each sector are included in the model. In order to compare the regional impacts of climate change, each of the eight provinces of Korea was set up as an independent rice farming system. The RCP (Representative Concentration Pathways) 4.5 and 8.5 scenarios were used as climate change data sets, and the effects of three government policy scenarios on the sustainability of future rice farming systems were tested: R & D to improve rice productivity, increase in agricultural subsidies, and expansion of irrigation facilities. The simulation results demonstrate that the rice farming system in Korea will continue to deteriorate and will decay more rapidly in the RCP 8.5 scenario. Although the rice productivity due to climate change will not change significantly, the costs of pest control will increase, and consequently, the economic efficiency of rice production will be lowered. This trend is expected to be similar across all provinces and more prominently in regions with higher mean temperatures. The simulation results of policy test show that improving crop productivity is the most effective way to maintain the rice farming system, and other policies are predicted to have little effect. Although there are regional variances, it is predicted that the sustainable period of the rice farming system will increase by more than 5 years whenever rice productivity is improved by 10%. Overall, the system dynamics model enables prediction of various future scenarios by simulating the dynamics of the components of the system and their interactions. The developed model can be used as a decision support tool to assess the impact of climate change on the sustainability of rice farming system and to evaluate various measures to adapt to climate change. Although the model is applied to the rice farming system of Korea, it will be possible to analyze other agricultural systems using the developed model structure and approach.

DEVELOPMENT OF META-MODELS TO SOLVE POLICY ISSUES REGARDING CLIMATE CHANGE IN THE CONSERVATION AREA

Abstract ID: 713

Group Submission: Climate Change and Environment Modeling I: Model Of inTegrated Impact and Vulnerability Evaluation of Climate Change (MOTIVE)

RYU, Jaena [Korea Environment Institute] jnryu@kei.re.kr, presenting author

JUNG, Okjin [Korea Environment Institute] ojjung@kei.re.kr, co-author

RYU, Donghyun [Korea Environment Institute] dhryu@kei.re.kr, co-author

SONG, Young-Il [Korea Environment Institute] yisong@kei.re.kr, co-author

Climate change impacts in the forest ecosystems could vary (Kirilenko and Sedjo, 2007). These include forest growth, natural disaster, biomass, distribution of forest species, and forest carbon. The impacts are complicate as one impact can influence the other and also react each other (Kurz et al., 2009). Meta-models are computationally-efficient or reduced-form models that emulate the performance of more complex (original) models to deliver fast run times (Holman and Harrison, 2011). Therefore these can be used to overcome computational difficulties of physically linked models in representing interlinked impacts of climate change. This study aims to develop meta-models to solve policy issues regarding climate change in the conservation area and to evaluate the integrated impacts of climate change on the forest.

This study developed and linked 5 meta-models which were meta-forest fire model, meta-landslide model, meta-Ko-D-Dynamics model, meta-Ko-D-Hytag model, and meta-FBDC model. From the 5 complex (original) forest models (forest fire model, landslide model, Ko-D-Dynamics model, Ko-D-Hytag model, and FBDC model), input and output datasets were gathered first. The main input datasets were non-climate and climate data under RCP 8.5 climate change scenario provided by Korea Meteorological Administration. Meta-models were developed using artificial neural networks (ANNs) and were calibrated and validated using outputs of the 5 forest models. The most suitable ANN designs were selected on the basis of the variability explained (R²) and the root mean square error (RMSE) to improve its accuracy. The output datasets were annual forest fire probability, landslide probability, species distribution, forest growth and forest carbon uptake in the South Korea for the meta-forest fire model, meta-landslide model, meta-Ko-D-Dynamics model, meta-Ko-D-Hytag model, and meta-FBDC model respectively, detailed 1-km resolution for the period around 2030-2080. In particular, the results of meta-FBDC model, forest carbon uptake, are the final output solving policy issues regarding climate change in the conservation area. These represent integrated impacts of climate change in the conservation area as the meta-FBDC model is the final linkage of the 5 models.

The models could be used to provide reliable scientific information and to assess adaptation measures. These have its strength on solving policy issues by delivering the results fast with much reduced run times. Various adaptation measures therefore could be easily assessed using the models. The models are expected to be used in the establishment of climate change adaptation plans in conservation area in more efficient way.

Recently, concerns about impacts of climate change on biodiversity and ecosystems have drawn much attention due to habitat loss of native species, the change of species distribution and expansion of invasive species. The objective of this study are to develop the vulnerability index of species and to assess the climate change impact and vulnerability of species and its habitat in South Korea. We developed the vulnerability index with the distribution change of plant species, and created hotspot and vulnerability maps using the output of an ensemble model of SDMs (Species Distribution Models) adopting the adaptability of species using dispersal ability (unlimited, long, middle, short dispersal). We selected 44 national climate sensitive indicator species plant species, 16 national alien invasive species and 216 national climate change adaptation plants with three range types which are endemic, northern and southern limit in South Korea. Bioclimatic variables were generated using HadGEM3-RA climate data which was created by Korean meteorological agency. Landuse, forest fire and landslide data were incorporated to build the assessment model. RCP4.5 and 8.5 climate change scenarios was used to predict the future distribution in 2030, 2050 and 2080. The results showed that the vulnerability of each species was ranked and changed according to climate change scenarios and adaptation ability and then we can set the priority of conservation plan for vulnerable species. Vulnerable habitats of existing species were detected. Current hotspots of climate sensitive species were located in north-eastern and south coastlines. Central mountain ranges will be new hotspots in the future. Current hotspots of alien invasive species were located in central and south-western regions. They will expand to south coastal line and north- western regions in the future. Current hotspots of plants are located in north-eastern region, central mountain ranges and Jeju island. The future hotspots of plants became small in same regions and changed under future climate change scenarios according to their range types. North-western region and north-eastern coast will be new refugia of species. Therefore, we can make appropriate adaptation policies to conserve vulnerable species and habitats using these results.

PLANNING FOR CHANGE: HOW DO LOCAL GOVERNMENT-PLANNING EFFORTS IN THE US PLAN FOR FOOD AND WATER IN A CHANGING CLIMATE?

Abstract ID: 17

Individual Paper Submission

RAJ, Subhashni [University at Buffalo, State University of New York] subhashn@buffalo.edu, presenting author

Land-use planning decisions, through zoning, development, and land allocation, impact the availability of and access to water and food in cities and their surrounding regions across the United States (Page and Susskind 2007). Consequently, considerable planning literature has focused on demonstrating the critical links between land-use decisions and water-resource management (Wiering and Immink 2006). More recently, as a result of Pothukuchi and Kaufman's (2000) landmark article calling on planners to pay attention to food, the field of planning has also begun to recognize food systems as a planning issue (Pothukuchi and Kaufman 2000, Raja et al. 2008). While studies of food and water have gained prominence in planning scholarship and practice (Page and Susskind 2007), the links among food, water, and land-use planning in a changing climate have received much less consideration.

This study focuses on the critical links among food, water, and land. Two research questions anchor the study:

1. How do local governments use planning tools to address food and water issues, especially in drought conditions?
2. How do local governments incorporate considerations of food systems and water resources in drought conditions into formal plan documents?

First, I analyze data from a national survey of American planners to understand how local governments use planning implementation tools to respond to water and food issues in drought conditions. Planning implementation tools encompass a range of actions available to local governments to enact strategies, policies, and actions captured in plans or other strategic documents. In this study, planning implementation tools include provisioning of easements, land trusts, legal land protections, density bonuses, development incentives, zoning ordinances, grants, loans, tax incentives, free or reduced-price utilities, public lands and licenses, and publically sponsored programs. I then use a plan-evaluation framework to measure the degree to which local governments integrate food and water considerations into plans prepared by local government and quasi-local government agencies in Doña Ana County, a drought-affected community in New Mexico. The plan evaluation discusses contradictory policies for food and water in plans that undermine resource management in drought conditions. The presence of such contradictory policies undermines the long-term sustainability of water and food resources and highlights the importance of understanding their interconnections.

I find that many local governments across the United States are not implementing planning tools to protect water resources or to help farmers adapt to climate change. Local governments that do take action, predominantly use zoning to regulate land use. In addition, the study reveals that local governments attend to water more than to food issues.

I recommend, on the basis of the results, that planners pay attention to the connection between land use and the food-water nexus. Developing closer working relationships with the water and agricultural community can help local governments better understand the interconnections across the food-water nexus. At a minimum, planners must be cognizant of these interconnections, to reduce unintended impacts of land-use decisions on the sustainability of water and food resources. I also recommend the development and application of new planning tools to address complex feedback that arises from a changing climate. New challenges emerging from climate change require innovative planning strategies.

DOES GREEN INFRASTRUCTURE PROMOTE EQUITABLE DEVELOPMENT? THE MEDIATING ROLE OF SOCIAL CAPITAL IN ASSESSING IMPACTS

Abstract ID: 58

Individual Paper Submission

FISCH, Jessica [Georgia Institute of Technology] jfish@gatech.edu, presenting author

Planners, policymakers, and elected officials increasingly view investments in green infrastructure, parks and other green development as opportunities for spurring economic growth, increasing environmental quality, and providing social and recreational amenities in urban areas. However, as planners and city leaders focus on these impacts of green projects, research has proposed that equity concerns--such as access for low-income and marginalized groups, affordability, and displacement--are often not adequately addressed, leading to 'environmental gentrification.' At the same time, several works have argued that networks of stakeholders have the potential to support more equitable development, thereby counteracting the potential for gentrification. To date, research has not fully examined the conditions under which more equitable outcomes for green infrastructure projects might be supported and the role of social capital development in addressing these concerns.

To address these concerns, this study seeks to clarify the mechanisms through which green infrastructure planning might support social capital development surrounding housing affordability, gentrification and displacement, and community benefits concerns. Further, it seeks to clarify the mechanisms through which social capital impacts green infrastructure planning and implementation, and policy development surrounding housing affordability, gentrification, and community benefits. The research will examine these interrelationships in two case cities with a prominent focus on planning for green infrastructure, high levels of segregation by race and income, and variation in political context and in project scale and form. Cases include the Atlanta Westside neighborhoods of Vine City, English Avenue, Washington Park, Bankhead, and Grove Park, and East of the River Washington D.C. neighborhoods of Anacostia, Fairlawn, Buena Vista, Barry Farm, Congress Heights, and St. Elizabeth's, areas which have engaged heavily in green infrastructure planning. In clarifying interactions between social capital and green infrastructure planning processes and outcomes, the research will enhance our understanding of how social capital might support an increased focus on equity concerns in green infrastructure planning, as well as on the importance of contextual factors such as state and local political context.

WILDFIRES AND ENVIRONMENTAL JUSTICE IN CALIFORNIA'S WILDLAND-URBAN INTERFACE

Abstract ID: 61

Individual Paper Submission

GARRISON, Jessica [University of California - Irvine] jdgarris@uci.edu, presenting author

HUXMAN, Travis [University of California - Irvine] thuxman@uci.edu, co-author

As climate change makes California hotter and dryer, the state's notorious wildfires are becoming more frequent and severe. Meanwhile, the distribution of ecological and social vulnerability is changing. Because wildland-adjacent homes command high prices, market pressure continues to push development and ecological disturbance into the expanding wildland-urban interface (WUI), rendering an increasing area vulnerable to wildfire. Meanwhile, since the late twentieth century, low-income people of color have increasingly been moving from central cities to older inner-ring suburbs in search of affordable housing. However, these inner-ring suburbs are, by definition, distant from the flammable WUI. Managing wildfire requires investing public resources in risk mitigation, fire suppression, emergency services, and post-fire recovery. Consequently, an increasingly diverse suburban population may be footing the bill to protect affluent wildland-adjacent neighborhoods, whose relatively wealthy residents may be putting themselves in more physical danger than they have acknowledged.

This paper will synthesize insights from urban planning and ecology to address the following questions: how do residents of areas burned by wildfire compare with the rest of California, how has this changed since the 1970s, and what are the implications for environmental justice? Four time periods will be examined: the 1970s, 1980s, 1990s, and 2000s. For each, the proportion of residents who are nonwhite and the proportion who are below the poverty line will be measured at the census tract level, using decennial census data. Census tracts that intersect the boundary of any fire during that decade (as mapped by the state's Fire and Resource Assessment Program) will be classified as wildfire areas. Using t tests, we will determine if wildfire areas significantly differ from the rest of California in mean poverty rate and proportion of nonwhite residents. In preparation, we have conducted a preliminary case study of Orange County in Southern California. Our results indicate that wildfire areas have consistently lower poverty and fewer nonwhites than the rest of the county. In addition, these populations have increasingly diverged since the 1970s. We expect to find similar patterns across California, given that Orange County's increasingly diverse population and expanding WUI make it prototypical of California suburbs.

By expanding this analysis to cover all of California, our proposed paper will give a broader picture of how climate change, development, and the suburbanization of poverty are reshaping the landscapes of ecological and human vulnerability to wildfire. The results will have significant implications for environmental justice. If low-income communities of color continue to have little access to open space, then public investment in wildfire management in the WUI will primarily benefit affluent residents. As California grows increasingly diverse, such an imbalance could imperil future political support for wildfire management, threatening the survival of these ecosystems. By analyzing suburbanization's changing demographics and ecological impacts through an equity lens, this paper will clarify the need for long-term regional planning to ensure wildlands are protected in a socially equitable manner that ensures all residents' future enjoyment of this natural resource.

USING GREEN INFRASTRUCTURE (THE GOODS AND SERVICES OF NATURE) IN A LAND USE PLANNING FRAMEWORK TO BUILD RESILIENT RURAL COMMUNITIES

Abstract ID: 67

Individual Paper Submission

KRAEHLING, Paul [University of Guelph] pkraehli@uoguelph.ca, presenting author

Planners have important roles to play in addressing the health and liveability aspects of life in rural communities (Caldwell, 2008; Frank and Reiss, 2014). This paper makes an argument that nature/natural systems, or green infrastructure (GI) can be leveraged to plan and build resilient rural communities. There are a number of interrelated ideas associated with the topic: a healthy ecological foundation is required as the basis on which human endeavour can occur using Cato's (2009) strong environment sustainability definition; and the elements embedded within the goods and services of nature are often unrecognized or under-appreciated as to how they benefit humankind, (Corvalán, Hales, & McMichael, 2005).

This paper will provide an overview of recent PhD research on the topic of GI planning in rural southern Ontario. This geographic context has been selected as it is a land use conflicted landscape, comprising various human-condition objectives from diverse governance organizations as well as in consideration of various private and public interests, i.e., a land base used extensively for development, resource activities (agriculture, forestry, aggregate extraction) and natural areas which are limited in extent and variety.

The research was conducted within a mixed method qualitative assessment approach examining the utility of a GI planning framework for use within rural municipalities. A variety of research tools involving a literature review, surveys, key informant interviews and various discussion forums were employed to examine the question "Can a planning systems framework be devised acknowledging the goods and services of nature as a mechanism to build resilient rural communities?" The work has also included a consideration of the following: a clear definition of GI planning, how it can be used in addressing community issues and challenges, what are some of its antecedents, how is it used in various parts of the world, and what are examples of GI program and action elements being used in rural Ontario communities today.

The information from the GI element research is categorized using themes from the European literature: community strategic initiatives; education, recreation and tourism; local food production; soil quality enhancements; biodiversity protection and enhancement; climate change adaptation/mitigation mechanisms; water and stormwater management; woodlands and trees; and other measures, e.g., degraded land rehabilitation efforts (European Environment Agency, 2011). A conceptual planning framework is formulated and is adapted from Rouse and Bunster-Ossa (2014). The GI planning framework is a systems design mechanism illustrating how a strong community foundation can be formulated. The framework clearly outlines the integration benefits of networking traditional built 'grey' infrastructure facilities with the multi-functional GI features of nature that are present in any community.

The research findings will be of interest to planners, policy makers and researchers who are intrigued by the idiosyncrasies of acknowledging, integrating and deriving additional utility from nature/natural system assets in our rural communities. The findings are illustrative of the potential collaborative and co-ordinative attributes of nature within a community. Based on practices found in many locales of the world today, a GI planning framework can be shown to be a useful device to structure conversations and activities around the competing land use interests of public/private sources. The planning framework provides a systematic approach for governments, special interest groups and citizens to work together, and provides utility to addressing issues that cross various municipal operational boundaries. While the beauty and 'priceless' value of nature is at the core of GI planning, the framework moves the planning agenda beyond this to leveraging additional value for human life and enterprise.

BEYOND CLIMATE-INDUCED MIGRATION: THE INTERACTIONS OF SOCIAL RESILIENCE, VOLUNTARY RESETTLEMENT AND THEIR IMPLICATIONS FOR PLANNING FOR CLIMATE CHANGE

Abstract ID: 72

Individual Paper Submission

MARIN, Marielos [University of Massachusetts Amherst] marielosmari@larp.umass.edu, presenting author
HAMIN, Elisabeth [University of Massachusetts Amherst] emhamin@larp.umass.edu, co-author
WHITE, Gregory [Smith College] gwhite@smith.edu, co-author

There is an increasing need for planning for climate change to explore with more consciousness of the interaction of climate change resilience and climate-induced migration in rural areas of developing countries. Due to the complexities of each phenomenon and other priorities regarding general research, the explorations have been focused on each topic independently. Nevertheless, in the last decade, there is an increase of study that combines both, focusing on the complexities that each provides to the system. This research evaluates the interaction of social dimensions of resilience and voluntary resettlement after a slow onset disaster. The emphasis is on the social capital aspects that are part of migration agency, by considering a critical single-case study research in Jiquilisco, El Salvador.

Jiquilisco is poor compared to averages in El Salvador and has experienced repetitive losses associated with climate change, most of them related to flooding, landslides, pollution, and droughts. Nevertheless, its residents have been reluctant to relocate. This research considers what is the role of social resilience in voluntary-resettlement after slow onset disasters? The objective is to understand the importance of social capital in the decision-making process to resettle. This study derives from semi-structured interviews with multiple sources of evidence and stakeholders. The data gathering and analysis consisted of the constant comparative method and theoretical sampling.

The research finds two main simultaneously complex and complementary results, first the decision-making process to resettle could be both an outcome of environmental disasters, but also cause a surge of environmental pressure on other cities and regions. Second, bonding and linking is prevalent among its residents, bonding but varies based on age, education, and social class, and strong social ties are essential reasons why residents stay. Linking, on the other hand, is also widespread with ‘ad-hoc’ community organizations and entities to preserve their rights and demand actions from the government to increase their adaptive capacity. Although focused on specific topics like food security and risk assessment, planning for climate change is not part of their agenda.

By understanding this complexity of the social ties and how is impacting the decision to relocate, the practice of the planning field can go beyond the mere inclusion of topics like relocation and resettlement programs in several international policy reports. In cases where social ties are active, a promising approach is to use advocacy planning to take the lead when promoting tools of planning for adaptation to climate change rather than relocation ‘per se.’ Even though, the plans may suggest relocation, the social resilience of communities plays a crucial role in determining whether to resettle or to stay.

In this sense, while planning for climate change, planners also need to understand the reasons behind why people decide to move or to stay to promote attuned actions with coastal communities. Different policies have been considered as adaptation measures and are part of the identification of possible projects, programs and policy actions of public investments and infrastructure. (UN-Habitat, 2011, 2014; UNEP, 2015) These actions were suggested depending on the threat level, the sensitivity of people, places, and institutions, but were considered especially for high hazard areas and informal settlements in which a “planned retreat” or relocation strategies should be part of the plans. (UN-Habitat, 2014, pp. 27, 63, 96).

The findings suggest the need to move away from explicit calls for resettlement of climate-impacted populations and instead provide the services that people want to stay in their locations, based on their reasons for staying. This one case study illuminates these complex interactions of social resilience and voluntary resettlement and are relevant in the many communities impacted by climate change.

GREEN INFRASTRUCTURE ADAPTATIONS AND AFFORDABILITY: THE CHALLENGE FOR ECONOMICALLY MARGINALIZED COMMUNITIES

Abstract ID: 98

Individual Paper Submission

HENDRICKS, Marccus [University of Maryland, College Park] mdh1@umd.edu, presenting author

NEWMAN, Galen [Texas A&M University] gnewman@arch.tamu.edu, co-author

YU, Siyu [Texas A&M University] yusiyu_1989@tamu.edu, co-author

HORNEY, Jennifer [Texas A&M University] horney@sph.tamhsc.edu, co-author

As part of the ongoing recovery from catastrophic flooding associated with Hurricane Harvey, Houston and other communities along the Texas Gulf Coast must consider the implementation of adaptations that are both just and affordable. Rapid development in the region over the last 50 years has increased the percentage of impervious surfaces and exacerbated flooding issues because there is less non-developed space to support stormwater absorption. Green infrastructure for stormwater management is often recommended as a sustainable, low-impact solution to localized urban flooding and larger scale inundation; many cities have initiated efforts for their installation. Several green infrastructure design/planning projects are the results of partnerships between universities and communities, which provides the opportunity to amplify solutions to flood related issues through service-learning. However,

there is a concern that urban green space solutions are not equitably available for all, particularly in marginalized communities. Service-learning projects provide an opportunity for making community design schemes more inclusive through university-community partnerships. However, design implementation remains challenging due to the high costs of proposed systems. This paper demonstrates how service-learning projects can sometimes leave socially vulnerable communities with unaffordable sustainable design solutions. Using landscape

performance modelling, we calculate projected costs for a set of green infrastructure proposals developed during a service-learning project in a vulnerable, underserved neighborhood in Houston, Texas. This paper argues that, while the solutions proposed can benefit the neighborhood in the long term, shortcomings include installation and maintenance costs, which create additional environmental and economic burdens for these already marginalized communities.

FISCAL VULNERABILITY TO SEA LEVEL RISE: TYPOLOGIES OF RISK, TAXATION, AND TIPPING POINTS IN COASTAL MASSACHUSETTS

Abstract ID: 124

Individual Paper Submission

SHI, Linda [Cornell University] lindashi@cornell.edu, presenting author

VARUZZO, Andrew [Cornell University] amv88@cornell.edu, co-author

Studies of local governments consistently reveal that inadequate funding is an impediment to climate adaptation planning and implementation (Carmin, Nadkarni, & Rhie, 2012). In this paper, we examine how future climate change will further impact local tax revenues, and which cities will be most affected. Fiscal stress due to climate change will affect local capacity to adapt, thereby shaping not only local but also regional vulnerability.

Assessments of local vulnerability to climate change have focused on the exposure of institutional and physical assets, sensitivity of different socio-demographic groups, and magnitude of damages associated with different climate hazards (e.g., Hamin, Gurrán, & Emlinger, 2014; Risky Business, 2014). Although studies recognize that vulnerability and adaptive capacity are unevenly distributed within and across municipalities (Cutter, Mitchell, & Scott, 2000), none have systematically examined how municipal finances will be affected by climate change.

In response to this gap, we present research assessing the fiscal vulnerability of municipalities in coastal Massachusetts to sea level rise. We overlaid six NOAA sea level rise scenarios with spatial information on municipal boundaries, building footprints, tax parcels, and state Department of Revenue data on local property values, tax rates, and tax assessments. We find that at six feet of sea level rise, 99 municipalities in Massachusetts will face direct impacts. In the twenty municipalities with the greatest tax exposure, sea level rise would directly touch buildings or inundate more than 25% of property parcels that currently generate 7 to 24% of the total municipal budget. As a percentage of municipal own source revenues, this percentage rises to 12 to 43%. By absolute value, Boston, Cambridge, and other urbanized cities in Boston Harbor have the largest tax rolls at risk to sea level rise, with a major increase in exposure between 4 to 5 feet of sea level rise. Residential municipalities, particularly those with expensive coastal real estate like Nantucket, Barnstable, and Falmouth, are also at risk. In some municipalities, mostly commercial or industrial properties face inundation, while in others residential properties do, pointing to the need for context-specific coalition building and responses.

This study presents a first snapshot of how one aspect of climate change (sea level rise) will add to the long-term fiscal stress of municipalities. Local governments are responding to current fiscal stress by applying for grants, deferring capital investments, and reducing tax sharing (Aldag, Warner, and Kim, under review). Significant fiscal stress may also affect municipal bond ratings. Vulnerable municipalities may therefore experience a vicious cycle of disinvestment in protective infrastructure that exacerbates climate impacts and property devaluation, even as they compete against each other for scarce federal and state resources. Fiscally, the incentive for vulnerable communities will be to recoup or anticipate their losses by incentivizing post-industrial waterfront development or raising tax assessments on residential properties. Tipping points later in the century may negate the tax base in low-lying areas added over the next fifty years.

Efforts to catalyze local adaptation have prioritized technical assistance and capacity building. This study shows that looming fiscal realities may inhibit investment in adaptation and paradoxically lead to development in at-risk areas. The next generation of local and regional adaptation should therefore consider fiscal and governance reforms that encourage and enable cities to “do the right thing.” The spatial distribution of the most vulnerable municipalities suggests that there are opportunities for regional fiscal strategies, land use policies, or even consolidation. This research is part of a larger project to integrate physical, social, and fiscal vulnerability assessments and to compare these vulnerability profiles across states with different state, county, and local policies on taxes and levels of fiscal stress.

LOW-CARBON CITIES IN CHINA: A STATE DISCURSIVE PROJECT IN SHENZHEN

Abstract ID: 212

Individual Paper Submission

LI, Yunjing [Columbia University] yl2510@columbia.edu, presenting author

As the role of cities in addressing climate change has increasingly been recognized over the past two decades (Bulkeley & Betsill, 2013), the idea of low-carbon cities has gained great recognition in practice as well as academic and policy discussions. In many developing countries witnessing rapid urbanization, this idea has become a popular way of imagining a future urban world. Furthermore, ‘low-carbon cities’ have constituted a dominant discourse under which urban development and governance is approached. It is unclear, however, how the concept of low-carbon cities is operationalized on the ground and how the general discourse of decarbonization influences the conventional growth-oriented urban institutions.

The goal of this paper is to better understand the the relations between discourse, socio-political contexts, and institutional arrangement for building low-carbon cities. Focusing on the Shenzhen International Low-Carbon City (SILCC), China, the paper addresses three main questions: (1) How is the idea of a low-carbon city operationalized? (2) What is the role of the state in this process? (3) How does the discourse of decarbonization alter development practice and the associated urban institutions? In answering these questions, the paper reveals

the particular obstacles and opportunities faced by cities as they increasingly engaged with addressing climate change. It also explores the progressive potentials within the emerging environmental discourse of carbon reduction to promote urban sustainability.

The research uses a case study design and the findings are mainly based on three field trips as well as 40 semi-structured interviews with related local government officials, professionals, developers and industrial interest groups, community residents and organization members, etc. The case analysis follows Hajer's (1995) argumentative approach to discourse analysis. In particular, the analysis builds on the concept of "story-line" to examine how particular discursive orders in the SILCC were established, maintained, transformed, and translated to practice activities (Hajer, 1995).

I argue that the low-carbon city is a state discursive project. Rather than an established material goal, a low-carbon city is an evolving process in which the discourse of carbon mitigation introduces a new package of values, parameters and governing logics into development practices and redefines the legitimacy and accountability of urban development. By virtue of the interpretive flexibility within the discourse of decarbonization, the state takes a strategic position to retouch the relationships between the economy, the environment and the society.

Being situated at the intersection of the works on sustainability policy, urban development politics, and environmental discourse, this paper aims to add to an accumulating body of literature on urban-scale solutions to climate change in general and urban low-carbon transitions in particular. More specifically, it interrogates how 'carbon rationing' in urban governance—a process of strategic calculation driven by the instrumental goals of cutting carbon emissions—has profound implications for the local development regime under the developmental state context (While et al., 2010).

POSITIVELY RESILIENT? PUBLIC PERCEPTIONS OF URBAN RESILIENCE AND IMPLICATIONS FOR PLANNING

Abstract ID: 218

Individual Paper Submission

MEEROW, Sara [Arizona State University] sameerow@umich.edu, presenting author

NEUNER, Fabian [University of Michigan] fgneuner@umich.edu, co-author

Cities are undergoing rapid economic, social, and environmental changes, while grappling with a wide array of risks and hazards, from climate change to natural disasters. For decades, academics and policymakers have been working to develop plans and policies to better cope with these threats and changes. These efforts have often been couched in terms of building sustainability, hazard mitigation, disaster risk reduction, reducing vulnerability, or adaptation. More recently, these efforts have been framed as a need to build resilience. One of the main explanations for the concept's growing popularity offered in the literature is that resilience has a better social connotation and is more positive than related concepts (McEvoy, Fünfgeld, & Bosomworth, 2013; Miller et al., 2010). Empirical evidence supporting this claim is lacking (Weichselgartner & Kelman, 2015). Moreover there is no consensus on how resilience is defined. Previous work has shown that definitions of resilience differ significantly within the academic literature and among US local government practitioners, but it is still unclear

how these ‘expert’ conceptualizations compare with the broader public’s (Meerow & Stults, 2016). This study uses two survey experiments to test 1) the widely stated, but largely unsubstantiated claim that resilience has a more positive connotation than other concepts; 2) whether the public is more likely to support policies aimed at increasing a city’s capacity to deal with challenges when they are framed in terms of ‘resilience;’ and 3) how the public conceptualizes resilience. Specifically, we test support for policies and conceptualization of four terms that are commonly used in the literature: making cities “more resilient,” “less vulnerable,” “more adaptive,” and “more sustainable.” Survey 1 was conducted on a convenience sample (n=500) of US-based adults drawn from Amazon’s Mechanical Turk crowdsourcing platform. Survey 2 was conducted on a broad national sample of US adults (n=1000) fielded by Survey Sampling International (SSI).

Overall, we find significant differences in policy support and perceived importance, which we trace back to variations in how the concepts are interpreted. Most surprisingly, the results suggest that respondents are significantly more supportive of these efforts when the term “sustainable” is used in comparison to the term “resilient”. We find no differences, however, in perceptions of how positive these two terms are. Analyzing open-ended questions about the meaning of these terms reveals that they evoke different associations. This leads us to hypothesize that the term “sustainable” may elicit more support because people are more likely to think about protecting the environment in that condition. We test this intuition in the second experiment by manipulating whether the supposed city efforts are couched in environmental terms. Our key quantities of interest then are: 1) whether the dynamics observed in Study 1 replicate, and (2) whether they are constant across the environmental manipulation. The results of the second experiment confirm our hypothesis. When the question prompt does not mention the environment we see the same difference in responses between the “sustainable” and “resilient” conditions, with respondents being more supportive when the term “sustainable” is used. However, when the prompt mentions the environment, this difference disappears and there is no significant difference in support for the measure between the “resilience” and “sustainable” conditions. These findings have implications for environmental and hazard planning. The study confirms that framing likely impacts public support for plans and policies, but it calls into question claims that resilience is inherently a more appealing frame.

A 3ES REPORT CARD FOR THE 100 LARGEST US CITIES AND METRO AREAS, 2000-2015

Abstract ID: 219

Individual Paper Submission

LANDIS, John [University of Pennsylvania] jlan@design.upenn.edu, presenting author

Much has happened since Scott Campbell published his 2003 interrogation of the nexus between sustainability and planning. Perhaps the most significant development is that the concept of sustainability has been systematically broadened to add progress toward equity and economic prosperity to original core concept of environmental and natural capital sustainability. These days, whenever planners speak of sustainability, it is usually in the context of “the 3Es” (environment, economics, equity).

Under this paradigm, how much more sustainable are American cities and metropolitan areas today than when Campbell published his seminal JAPA article in 2003? This paper will use the double-decile difference method

(3D) as applied to multiple measures of economic prosperity, economic and racial equity, and natural resource use and pollution levels among the 100 largest U.S. cities and metropolitan areas to identify which are the most and least sustainable, and which have improved or backslid the most since 2000. As a reminder, the 3D method sorts places (e.g., cities, MSAs, census tracts) into deciles along some measure or combination of measures, and then determines how the various decile ranks have changed over time. The advantage of the 3D method is that it can be used to robustly identify rankings and changes in rankings over time even when the underlying indicators have changed, as is typically the case with economic indicators not denominated in constant dollars (Landis 2016). Among the economic prosperity indicators we will examine (for each city and metro area) are median household income, poverty rates, labor force participation and unemployment rates, housing cost burdens, and college graduation rates. Among the environmental and natural resource measures we will examine are rates of resource-to-urban land conversion, wetland loss, residential energy consumption rates, air and water pollution levels and standard violation incidence, and CERCLA cleanup activity. Among the equity measures we will examine are Gini coefficients, segregation indices, various socio-economic measures, and pollution exposure levels, all disaggregated by race and ethnicity. These individual measures will be combined into summary environmental, economic, and equity indices, and then compared across the 2000-2015 period. Additional statistical analysis will be undertaken to identify the degree to which the observed performance levels follow particular spatial or other patterns. Of particular interest will be any correlations between cities and metro areas that have undertaken sustainability planning and/or programming efforts and observed improvements in their environmental, economic, and equity performance levels.

DECENTRALIZED WATER INFRASTRUCTURE FOR GROWING URBAN NEIGHBORHOODS: ENVIRONMENTAL, SOCIAL, AND FINANCIAL IMPLICATIONS

Abstract ID: 225

Individual Paper Submission

LEE, Heonyeong [Georgia Institute of Technology] leehy@gatech.edu, presenting author

LEIGH, Nancey Green [Georgia Institute of Technology] ngleigh@design.gatech.edu, co-author

There is continued concern over the long-term sustainability of conventional centralized water infrastructure. The alternative, decentralized water-conserving technology, such as rainwater harvesting and greywater recycling, has been widely discussed. However, the lack of knowledge around the financial, social, and environmental consequences of city-wide applications of decentralized technology impedes mainstream acceptance of the technology. To bridge the knowledge gap, this study investigates financial, social, and environmental impacts of decentralized technologies for urban water system administrations. We then describe a simulation model that traces dynamics in urban land use, population, water demand, and effectiveness of decentralized technologies. To develop this simulation model, we employ a variety of data sources, including actual household water bills in Atlanta between 2013-2015. The model is applied to a low-income urban neighborhood in Atlanta, where an average household spends over three percent of their annual income on water bills. With this simulation model, we estimate the reduction in water demand and water bills, as well as financial health of an urban water infrastructure system after the introduction of technology (rainwater or greywater system) at a decentralized scale (individual or shared scale). We also evaluate the cost of combining centralized and decentralized water technology, incorporating construction and operation costs obtained from the City of Atlanta's Department of Watershed Management. To account for future uncertainty, we test both slow and rapid development scenarios for our study area. The results of our analysis indicate that decentralized water infrastructure can reduce total

neighborhood water demand by 21-47%. The reduction in potable water consumption leads, in turn, to lower water bills for households and business establishments. Significantly, our simulation indicates a shared system can be operated without harming the financial health of urban water system despite the reduction in revenue from water bills. Overall, our study suggests that decentralized water infrastructures can be both effective and efficient tools for cities to meet growing demands for water and pressures placed on conventional centralized systems without increasing the cost burdens for water on households and businesses.

CREATIVE RESILIENCE: COMBINING URBAN AND MILITARY ADAPTATION CAPACITY IN NORFOLK, VA

Abstract ID: 294

Individual Paper Submission

TEICHER, Hannah [MIT] hannah.teicher@gmail.com, presenting author

At the best of times, federal progress on climate change, whether mitigation or adaptation, has been slow in the United States. As the threat of climate change has become more severe, cities and regions have attempted to fill this void. These efforts have gained more urgency in the wake of the Trump administration's attack on federal environmental capacity and withdrawal from the Paris agreement. While cities are making notable efforts, legitimate questions remain about just how much they can accomplish on their own and to what extent they are hampered by a lack of federal support. This leads to the overarching question: in the context of a low federal commitment to addressing climate change and inherent limits to the capacity of localities and regions to accomplish adaptation, what "back door" federal opportunities can urban leaders leverage to reinforce their own adaptation efforts and elevate a broader adaptation agenda?

One such "back door" that has received little attention in the context of urban studies and planning is the Department of Defense. For at least fifteen years now, the DoD has been taking climate change seriously, factoring climate risks into scenario planning, facilities planning handbooks and building codes. At the same time, think tanks have developed expertise to promote a "climate security" policy agenda both inside and outside of the federal government. In this context, the city of Norfolk, Virginia, home to the largest naval base in the world, has become ground zero for urban/military collaborations for adaptation planning. This raises the following questions: How and why do municipal and military leaders collaborate on adaptation? Does the adaptation occurring alter or overcome commonly understood limits to adaptation? What are the policy and planning impacts of a climate security discourse?

This research is undertaken through a case study method comprised of over 30 semi-structured interviews with urban and military stakeholders, participant observation of multiple conferences from the urban and military perspective, and content analysis of policies, plans and media. Analysis is conducted through a multi-step coding and discourse analysis process attending to discourses, subject positions, and practices.

While there are clear risks to military influences in urban planning, in this case, urban/military collaborations have led to some progress on adaptation. In Norfolk, stakeholders have engaged in a unique adaptation process developed from the ground up; though this appeared to result from a federal mandate, it was in fact initiated by a group of local “champions.” Subsequently, those same leaders have adapted a long-standing, widely-replicated military planning process to directly address current flooding impacts. In one surprising result, the historically antagonistic cities of Norfolk and Virginia Beach are now productively cooperating on adaptation planning. In this sense, the military presence appears to be facilitating more inter-municipal cooperation at the local level, tempering one significant barrier to adaptation planning. The “climate security” angle also has a tangible local impact; as widely respected military personnel advocate for climate action, they engage a broader public.

This military role in adaptation planning has direct implications for a number of American cities with a significant defense presence. But, more importantly, this research is relevant to other forms of intergovernmental adaptation planning and lessons from this context could be instructive for multilevel planning between localities and national organizations such as hospital systems with a vested interest in adaptation. Practice and scholarship of multilevel adaptation planning will benefit from a deeper understanding of urban/military collaborations.

COMMUNICATING ABOUT FLOOD RISKS WITH REAL ESTATE MARKET ACTORS

Abstract ID: 300

Individual Paper Submission

ANDREWS, Clinton [Rutgers, The State University of New Jersey] cja1@rutgers.edu, presenting author

A “science-push” model of expert advising inspires much scientific information about coastal flood risks and sea-level rise. Such an approach attributes failures to heed scientific warnings to ignorance, stupidity, or irresponsibility. This paper offers a contrasting “demand-pull” perspective by focusing on the needs, interests, and capabilities of different coastal decision-makers; investigating what decision-makers in coastal real estate markets want to know about; and asking how they understand coastal flood risk. By focusing on the demand for sea-level rise and coastal flood risk information, the paper aims to improve the effectiveness of this type of scientific communication.

With funding from the New Jersey Sea Grant Consortium, we employed a mixed-methods approach that touched many risk information users. We convened an expert group to characterize the scientific consensus on flood risks in coastal New Jersey, and they produced a concise, insightful report. Then we convened a group of professional stakeholders and policymakers to identify local, state, and federal policy implications of that report; they wrote their own companion report. With these twin baselines, we conducted separate focus groups with professional planners, real property appraisers, and realtors, and one with a mixed group of professionals. Next, we conducted focus groups with recent home buyers in three coastal communities: Asbury Park, Toms River, and Union Beach, NJ, which suffered significant but disparate impacts during Hurricane Sandy in 2012. We took a deep dive into one town, Union Beach, to understand how public policies interacted with real estate market transactions prior to

and following the hurricane. Finally, we quantified the extent to which housing prices incorporated flood risk information using hedonic regression analysis of recent property sales.

Key findings include the following. The econometric model confirms that houses located in floodprone areas sell for lower prices, all else equal. Home buyers experience confusion in interpreting coastal flooding risk data. There are two distinct residential coastal real estate submarkets in NJ – seasonal and year-round. Recent events such as Superstorm Sandy have served to exacerbate this difference. Nearly all seasonal home purchases in desirable coastal communities are transacted in cash, do not require flood insurance (there is no mortgage) and are treated as likely to flood (e.g., nicer interior finishes are reserved for upper floors). Year-round buyers are more concerned with flooding risk, confused by multiple and changing flood-related regulations, and fear that flood insurance will become unaffordable. Among realtors and appraisers, “sea level rise” can be an off-putting term and planners encounter resistance to the use of this phrase and also “flooding risk.” All parties agree it is okay to discuss recent flooding or repeat flooding in communities where this is “a fact of life.” Realtors and planners are aware of the Community Rating System while appraisers are not. There are serious institutional barriers to successful information sharing. For example, planners have parcel elevation data but are not allowed to enter it into the databases used by property tax assessors; the assessors do not otherwise use such data.

The relevance of this work to planning is its (1) identification of the distinct information needs of different participants in real estate transactions, (2) demonstration that professional silos hinder the effective flow of information, and (3) confirmation that “official” information is more important than accurate information at almost every step in the transaction process.

PREDICTING FLOOD RISK INCREASE DUE TO URBAN GROWTH: THE CASE OF TAMPA, FLORIDA

Abstract ID: 324

Individual Paper Submission

KIM, YOUJUNG [Texas A&M University] yk2247@gmail.com, presenting author
NEWMAN, Galen [Texas A&M University] gnewman@arch.tamu.edu, co-author

Rising sea levels due to climate change will make U.S. coastal cities more vulnerable to floods. Growing populations and urban expansion can worsen climate change conditions and enlarge hazard impacted areas. When open space land uses are converted to urban land uses, flood risk can increase due to increased floodplain areas and impervious surfaces. Land use change is the result of interaction between human activity and natural resources (Agarwal et al., 2002). Understanding historic land development processes in order to better predict future circumstances helps support urban planning for potential flood risk mitigation.

This research examines flood vulnerability for future urban growth in the lieu of sea-level rise using Tampa, Florida, USA as a study site. It seeks to answer the question: how much urban land will be at flood risk by 2040 and 2100 when considering sea-level rise and projected urbanization?

Drawing from 16 proven determinants, proximity (e.g. waterfront, residence) and density (e.g. slope, population density) variables, for urban growth from the literature, this research employs two analytical methods to identify variable relationships between driving factors for urban change: logistic regression and drop-one experiment (Brown et al., 2013; Pijanowski et al., 2002). Future land use is forecasted using the Land Transformation Model (LTM), a GIS based artificial neural network prediction tool for analyzing relationships between spatial predictor drivers and predicted cell change (Pijanowski et al., 2002). The sea-level rises floodplains by 2040 & 2100 are spatialized using a rising sea level of 0.62m & 3.21m predicted by the National Oceanic and Atmospheric Association by adding to the base elevation of the 100-year floodplains (Berke et al., 2015). Future flood impacted areas are calculated from the forecasted land use change 2040 and the sea-level rise 2040 & 2100.

Due to spatial autocorrelation, systematic sampling methods were utilized with a 330m distance to minimize spatial dependency. The logistic regression result shows that population density and distance to school, significant level at 5%, are negatively related: the less are population density and school distance, the more probable is urban growth. Distance to waterfront and slope are negatively related, and distance to residence is positively related, significant level at 10%. The drop-one model result shows that slope and race variables are the most influential factors, with distance to waterfront and park variables the least. Forecasted model calibration outputs are measured to validate the accuracy of the prediction model: PCM 52.5%, Kappa 49%, Overall Agreement 93%, and Area under the ROC Curve 75%, with all levels showing an acceptable or good level of prediction. The projected 2040 sea-level rise in the extreme scenario case (+ 0.62m) permanently occupies 8.9km², 3% of Tampa's area. When sea-level rise and the 100-year floodplain are combined, 107.9km², 35% of the land in Tampa is under high flood-risk: existing urban 43.7km², future urban 12.8km², and undeveloped area 51.4km². When examining the projected 2100 sea-level rise (+3.21m), 141.2km², 46% of land, which is 33.3km², 11% more land than the 2040 sea-level rise case, is under flood-risk (existing urban covers 68.3km², future urban 15.3km², and undeveloped area 57.6km²). Results suggest that, when predicting sea-level rise and future urban, the Tampa Comprehensive Plan must prepare their hazard mitigation plan for both the permanently inundated existing and future urban areas with increasing flood risk.

This study contributes to the improvement of understanding land change driving factors and predicting urban growth methodology and flood risk. The results will help city officials and communities to identify flood vulnerable areas, to guide direction for urban growth, and finally to establish a more resilient urbanized area.

THE IMPACT OF HURRICANE MARIA ON COMMUNITY FLOOD EVENT PLANNING AND MANAGEMENT FRAMES: THE CASE OF SAN JUAN, PUERTO RICO

Abstract ID: 349

Individual Paper Submission

SANTIAGO, Luis [University of Puerto Rico] luis.santiago47@upr.edu, presenting author
FLORES, David [USDA Forest Service] david.flores@fs.fed.us, co-author

The passage of Hurricane Maria in Puerto Rico has transformed how communities and individuals perceive and manage urban flood risk. The Rio Piedras watershed, located in the San Juan, Puerto Rico metropolitan area is of particular interest given its high population density, its proximity to critical infrastructure, including Puerto Rico's main port and airport, and a history of flood management through channelization and other engineered measures. Our research explores how Rio Piedras watershed community leaders reframed flood event planning and management at the community level after the passage of Hurricane Maria, considering the event's impact on livability.

We consulted twenty-five community leaders using a semi-structured interview format. Data was collected during two time periods: pre-hurricane (January to May, 2017), and post-hurricane (February to June, 2018). Interviews were transcribed and translated for content analysis, with an emphasis on identifying flood event planning and management frames at the community level, and the subsequent reframing as a result of Hurricane Maria.

Preliminary findings reveal that younger community organization participants considered local green infrastructure solutions as a critical way forward. Older participants still emphasized the role of government in flood event planning and management for San Juan area at-risk communities, even though there was a recognition of government led tried and not-so-true engineered solutions implemented at the local and regional levels.

Community leaders' flood event planning and management frames, including the role of green infrastructure, are of particular interest given the insufficiency of current engineered measures to minimize vulnerability due to hurricane damage and a history of implementation of short term local coping strategies. Hygienic versus green city imaginaries will be used to explore the extent to which community leaders adhere to hygienic, engineered visions of the city or advocate transitioning towards strategies that consider ecological processes and functions. Bottom up, ecologically inclusive approaches will increasingly become a key component of flood event planning and management strategies given current financing constraints for engineered infrastructure and an increase in the frequency and severity of extreme storm events in the Caribbean.

PLAN INTEGRATION FOR RESILIENCE SCORECARD: ASSESSING FLOOD VULNERABILITY AND THE NETWORK OF PLANS IN NIJMEGEN, NETHERLANDS

Abstract ID: 381

Individual Paper Submission

YU, Siyu [Texas A&M University - College Station] syu@arch.tamu.edu, presenting author

BRAND, A.D. [TU Delft] A.D.Brand@tudelft.nl, co-author

BERKE, Philip [Texas A&M University - College Station] pberke@arch.tamu.edu, co-author

Different community plans (land use, transportation, environmental) guide growth and development in hazard areas, and thus the integration of multiple and independent plans can significantly impact future community vulnerability to hazards. The Netherlands is one of the most flood-vulnerable countries on earth, with 55 percent of housing located in areas subject to flooding. Although massive coastal engineering projects have largely eliminated the threat of flooding from the sea, significant dangers remain with respect to riverine flooding. To address this in the near- and long-term, the Dutch government has begun to take a new approach—making more room for water rather than continuing to increase the size of dikes. However, a lack of coordination between this “Room for the River” initiative and a community’s network of spatial plans may increase the vulnerability of people and the built environment. Little is known about the degree to which plans are coordinated with the “Room for the River” program and the ultimate influence of plans on flood vulnerability.

This study explores the influence of plan integration on community resilience to flooding in the Dutch city of Nijmegen, the site of the largest “Room for the River” project in the Netherlands. The research questions examined are:

- (1) How well-integrated are “Room for the River” program policies throughout the Nijmegen network of plans?
- (2) How does this integration affect vulnerability to flooding at the neighborhood scale?

A three-phase process is used to evaluate plan integration and flood vulnerability in the City of Nijmegen (Berke et al. 2015): (1) delineate planning districts (e.g, neighborhoods, downtown, ecologically sensitive areas) and hazard zones; (2) determine the level of vulnerability; and (3) determine scores that measure the degree to which plans integrate hazard vulnerability reduction in different districts.

Findings show that the policies of the “Room for the River” initiative are integrated throughout the City of Nijmegen’s network of plans regarding flood vulnerability reduction and natural area protection. However, national, provincial, and local plans and policies are not consistent in reducing vulnerability at the district level. These inconsistent policies are aimed at increasing density and economic development in neighborhoods that are already highly vulnerable.

The Plan Integration for Resilience Scorecard provides scholars and planning practitioners with a new method to assess how networks of plans influence community vulnerability, and to determine the degree to which plans target the most vulnerable geographic areas. It can be used to support the “Room for the River” program’s goal of aligning with local development priorities while expanding the floodplain to reduce national flood risk. The scorecard is recommended to help communities self-evaluate their plans and make revisions to improve integration of vulnerability reduction in local networks of plans.

ENVIRONMENTAL JUSTICE AND THE PROVISION OF STORMWATER INFRASTRUCTURE: FINDINGS FROM HOUSTON

Abstract ID: 422

Individual Paper Submission

LEE, Jessica [Texas A&M University] jjlee8605@tamu.edu, presenting author

VAN ZANDT, Shannon [Texas A&M University] svanzandt@arch.tamu.edu, co-author

Land use planning and capital investment in infrastructure work together to generate development patterns. The resulting development patterns may interact with the natural environment to influence the hazard exposure of neighborhoods. Stormwater management infrastructure is intended to mitigate flooding by managing runoff and streamflow of stormwater in an area (e.g. watershed and/or neighborhood). Yet recent research has revealed the unfair distribution of stormwater infrastructure across neighborhoods based on the racial/ethnic composition, suggesting discrimination in the provision of infrastructure (Hendricks, 2017; Mandarano, et al., 2017). However, current research is limited by the types of infrastructure considered.

This research builds on work by Hendricks (2017) to examine the distribution, capacity, and condition of stormwater infrastructure, including not only the roadside open ditches but also buried grey infrastructure, across diverse neighborhoods. Specifically, we address following questions: 1) How is the distribution of roadside open ditches and buried grey infrastructure associated with neighborhood socio-economic composition?; and 2) Does neighborhood socio-demographic composition relate to the adequacy (capacity and condition) of stormwater infrastructure?

This research examines a specific case site: the City of Houston, Texas. Perhaps the largest, most diverse, and most exposed city in the U.S., Houston has been suffering from local flooding problems for the past 30 years, due to its location in a coastal, low-lying area, making it a strong case for examining the equitable distribution of stormwater infrastructure. Our data comes from GIS shapefiles provided by the City of Houston GIMS website (<http://www.gims.houstontx.gov/PortalWS/MainPortal.aspx>). The dataset includes existing location, size, and condition information of roadside open ditches and buried grey infrastructure, including culverts, inlets, and such on. We merge it with ACS census block data, the smallest unit at which demographic characteristics are available. We examine the provision of infrastructure, its condition and adequacy (size, as appropriate for population density), and use bivariate correlations and regression to answer the research questions.

Our review of environmental justice and social vulnerability literature leads us to the following hypotheses: 1) Socially vulnerable neighborhoods have more open ditch systems and less grey infrastructure for stormwater management, when controlling for density; 2) Low-income neighborhoods and neighborhoods of color have more poorly maintained open ditches and culverts; and 3) Socially vulnerable neighborhoods are more likely to have infrastructure which does not meet the city standard. The expected findings of this research have substantial implications for how the reduction of hazard risk for vulnerable populations may be achieved. Understanding the distribution and adequacy of stormwater infrastructure will be helpful to develop land use plans and capital improvement plans to reduce and make more equitable the impacts from flooding.

BRIDGING POLICY ADOPTION AND POLICY IMPLEMENTATION – AN EXPLORATION OF LOCAL GOVERNMENTS’ SUSTAINABILITY ACTIONS

Abstract ID: 424

Individual Paper Submission

LIAO, lu [Cornell University] ll743@cornell.edu, presenting author

WARNER, Mildred [Cornell University] mew15@cornell.edu, co-author

HOMSY, George [Binghamton University] , co-author

Scholars of the policy process have long argued the distinctions between policy adoption and policy implementation. Different interests and information are involved in these two stages, and more scholarly attention is needed on the connections that bridge adoption and implementation. The specific characteristics of the policy add complexity to the discussion. To address these gaps, we take four issues – waste management, water conservation, energy conservation within governments, and energy conservation at the community level, and group local policies under these four issues according to their levels of complexity and innovation. We empirically explore factors that influence adoption and implementation in these four policy areas. Our data come from a national survey we conducted with the International City/County Management Association of all municipalities and counties in the United States in 2015. The survey measured the adoption of 6 policies in water, 10 in waste management and 15 in energy at the government level and 10 in energy at the community level. The survey also measured performance in these four sustainability policy areas. 1899 counties and municipalities responded.

We conduct regression models for each of these four policy domains comparing factors leading to policy adoption and policy performance. We also control for the state fixed effects to account for the variances at the state level. Our preliminary results show that factors that influence sustainability policy adoption are more related to local government characteristics such as goals, sustainability staffing and fiscal capacity. By contrast, the implementation of policy is more of a political process that involves voices of different stakeholders - pressure from the residents, pressure from the advocacy groups and pressure from the business. Within each policy arena we find adoption of the more complex issues is driven by the capacity of government while the adoption of the easier policies is more likely to be influenced by the local voices. Lastly, we find local governments with sustainability goals are more likely to take actions in the areas that requires more innovation (such as energy usage), while performance measures are more common in policy adoption in more traditional areas (such as water and waste). Our study bridges the gap between policy adoption and policy implementation, and shows goal setting and technical capacity are most important in promoting innovation, while citizen pressure and performance measurement are more common in more traditional policy areas. Our work enhances scholarly understanding by providing further empirical information on the patterns of policy process.

EFFECTS OF AUTONOMOUS VEHICLES ON VEHICULAR EMISSIONS

Abstract ID: 427

Individual Paper Submission

HWANG, Ha [University at Buffalo, The State University of New York] hahwang@buffalo.edu, presenting author

Autonomous vehicle (AV) technology is in its final stages, and related experts predict that AVs will be commercialized within 10 years. Although many researchers have proposed a prospect for changes in the behavior of our lives and the effects on the industrial economy due to the introduction of AVs, there is a lack of research on the environmental impacts, especially on the effects of vehicular emissions to air pollution. The introduction of AVs is expected to bring about fundamental changes in traffic demand, supply, and driving behaviors. These changes will cause total and spatial changes in vehicular emissions, and these changes are important both in terms of Environmental Sustainability and Environmental Equity. Therefore, before the introduction of AVs, thorough investigation should be conducted on factors that cause changes in total amount of emissions and whether the increased emissions caused by these changes are concentrated in a specific region or class.

In this study, we analyzed the effects of driving behavior changes on the total amount and spatial change of vehicular emissions by AV introduction. The changes in driving behavior were considered as two factors: 1) increase in road capacity due to reduction of distance between vehicles; and 2) increase in traveling speed limit due to increase of driving stability. Simulations were conducted by using a virtual transportation network with increasing the traffic link capacity from 0% to 50% and increasing the speed limit from 60 km/h to 140 km/h, respectively.

The simulation results are summarized as follows. First, as link capacity of the virtual transportation network increases, the average link speed increases and the amount of vehicular emissions decreases. Second, as the link capacity increases, the vehicular emission reduction rate becomes larger as the amount of link emission is higher. When the link capacity increased by 50%, the standard deviation of link emissions decreased by less than a half compared with 0% increase. These results show that the introduction of AVs has the mitigation effect on vehicular emissions caused by road congestion. Third, the amount of vehicular emissions shows a concave curve shape as the traveling speed limit increases. The amount of vehicular emissions decreases as driving speed limit increases, but it tends to increase when the speed limit exceeds 95 km/h. Fourth, when observing changes in vehicle emissions per individual link, links with increasing link emissions continue to increase, and links that decrease tend to continue to decrease as link speed limits increase. This is due to the fact that traffic volume is dispersed to the paths with longer distance without traffic congestion as the speed limit increases. Lastly, the standard deviation of link emissions is the smallest at a speed limit of 110 km/h, but the effect is not significant.

Congress originally intended to encourage private property owners of all incomes to preserve natural and scenic resources with significant public benefit, using the federal tax deduction for the easements that meet specific but malleable criteria (i.e., in purpose, placed in perpetuity, and held by qualified easement holders). There is a small but growing body of research that has been examining private land conservation motives, particularly as conservation easements have been increasingly and ubiquitously used throughout the U.S. These studies are limited by small sample sizes (Ernst & Wallace, 2008; Farmer et al., 2011; Brenner et al., 2013) or by the conservation easement holder typology (Rissman et al., 2007). Their findings are disparate but suggest that the federal incentive has some impact (although it may not be the primary motivating factor) in the landowner's decision to place a conservation easement. In central upstate New York, Brenner et al. (2013) found that the land uses on a property, particularly "recreation and wild food prospecting, are among the most powerful and significant predictors of landowners' willingness to conserve conservation easements" (30), as well as owning a large parcel of land.

To continue contributing to the literature on private land conservation motives, our team tested the Brenner et al. (2013) findings and broadened their geographic scope by eight counties in four states, California, Colorado, Minnesota, and South Carolina. Using a fine-scale dataset of easements, their characteristics, their locations, and their underlying parcel values, we conducted a pre- and post-approach in ArcGIS on the conservation easements parcels (and adjacent ones, within a buffer for land use types) in these four counties over a decadal period (1997 – 2008, when data permitted). We determined the underlying land uses of the conservation easement parcels, as well as their size, both before and after the easement placement to ask if there is a consistent and statistically significant pattern/trend that emerges in conservation easement parcel size and underlying land uses, regardless of location or state. These results were also refined by analysis solely on donated easements, or easement holder type, where there was a sufficiently statistically significant sample size.

While our findings do not isolate individual motivations, which can only be ascertained through landowner surveys and/or interviews, they contribute to the growing body of private land conservation motivations by testing an existing finding in one geographic location. They also further distinguish spatial patterns in the conservation easement placement. The results can inform planning policy, particularly since planners can more directly influence the parcels and zoning within their jurisdictions than broader federal tax policy.

POTABLE WATER REUSE IN THE INLAND SOUTHWEST: UNDERSTANDING PUBLIC PERCEPTIONS

Abstract ID: 472

Individual Paper Submission

DISTLER, Lauren [University of New Mexico] distler@unm.edu, co-author

SCRUGGS, Caroline [University of New Mexico] cscruggs@unm.edu, presenting author

In the face of increasing population, development pressures, and climate change, many regions around the world face freshwater shortages. Planned potable water reuse can improve the sustainability and reliability of water supplies by generating high-quality drinking water from wastewater (USEPA, 2012). While technically feasible, project implementation faces challenges associated with public acceptance and education (e.g., Dolnicar et al., 2010; Hurlimann and Dolnicar, 2010). Though most potable reuse research has focused on large coastal communities, the US Department of Interior predicts that “hot spots” of conflict over water in the arid West are “highly likely” in numerous inland communities. Potable reuse options may be different in these two contexts, not only in terms of the technologies used, but also in the communities’ knowledge of and attitudes toward the required technologies (e.g., Ormerod and Scott, 2013). Furthermore, little is known about the level of public knowledge on various related topics, such as water scarcity, climate change, and the urban water cycle. Due to the impact that information and education may have on acceptance of water reuse, it is important to consider the information the public receives on the topic during planning and implementation, and the sources from which that information comes (Wegner-Gwidt, 1991). Significant knowledge gaps exist regarding these issues for the arid, inland context, making it difficult for inland water planners to understand the feasibility of potable reuse for their communities.

Our study aims to fill these gaps using a large (n=4,000) survey, which was preceded by focus groups, debriefing sessions, and pretesting to hone the survey instrument. We used Albuquerque, NM, as a case study, with water utility customers as our sample population, and collaborated with the Albuquerque Bernalillo County Water Utility Authority. Our main objectives were to determine public acceptance of two types of potable water reuse and whether or not the type of educational materials provided to respondents affected their level of acceptance. We tested educational materials with three different themes, which have been linked to increased acceptance of reuse in the water reuse and water communication literatures: 1) water scarcity and reliability of supplies, 2) the environmental benefits of wastewater reuse, and 3) the urban water cycle and current unplanned reuse practices. A fourth set of materials (no educational information) served as a control. Aside from acceptance of reuse, the survey also collected data on the population’s climate change perceptions, water use at home, level of trust in various entities, and demographic data. The response rate for the survey was 46%. Preliminary data analyses using R Studio and Excel indicate that there is: little difference in acceptance levels across the different educational materials, a relatively low level of trust in the local government and media, a high level of trust in academic researchers and public health professionals, and relatively high levels of awareness of climate change and water scarcity issues. Also, our population had a much higher overall acceptance of potable water reuse as compared to populations from other studies found in the literature. It appears that several factors may have predictive power in the likelihood to accept potable water reuse. Water planners in New Mexico and other arid inland regions can use the final results of this survey to make informed decisions on public communication and education processes, which are necessary to the success of water reuse projects. This research was supported by the National Science Foundation (award 1345169).

RACIALIZATION IN INFRASTRUCTURE REBUILDING: LESSONS FROM SEWER SYSTEM UPGRADES IN SAN FRANCISCO, CA

Abstract ID: 504

Individual Paper Submission

SOLIS, Miriam [UT Austin] mvsolis@gmail.com, presenting author

This research examines how the rebuilding of crumbling wastewater infrastructure systems across the country presents an opportunity to advance racial justice. Critics of technocratic planning methods of the past argue that the next wave of wastewater systems should be less centralized, both in their management and design. Christian-Smith and Gleick's (2012) call for a soft-path to water, for example, involves creating more system efficiencies by better matching resource management to users' needs. These ideas are echoed in Sedlak's (2014) Water 4.0 concept, which proposes greater engagement on the part of homes and neighborhoods. Yet, despite the well-documented environmental burdens created by wastewater infrastructure in low-income communities of color, these frameworks pay minimal attention to the potential role of marginalized communities in the rebuilding process. This research suggests that the repair of wastewater infrastructure is a site for critical engagement due to its potential to reproduce patterns of racial exclusion, as well as well as an opportunity to create infrastructure that is socially just. It builds on environmental justice theory's insights on the politics of scale (Swyngedouw and Heynen 2003; Sze et al. 2009) to draw conclusions on how the involvement of low-income communities of color in the planning process reshapes our understanding of the future role of wastewater infrastructure in cities. I posit that there is a scalar mismatch between the goal to decentralize wastewater planning to individual service users and neighborhoods and the risk of gentrification and displacement low-income residents of color face.

In San Francisco, wastewater planning's racialized history and efforts to avert patterns of exclusion have converged. Eighty percent of the city's wastewater is treated in Bayview-Hunters Point, a historically African American neighborhood. At the same time, the city's utility is the first in the country to adopt an environmental justice policy. The attempt to correct-course the sewer system is complicated by citywide gentrification and displacement trends. In this research, I illustrate how the physical renovation of the treatment plant involves turning a burden into an asset in a gentrifying neighborhood and ask how scalar bounds of the infrastructure are conceptualized and enacted. How does planning conceptualize the relationship between infrastructure upgrades and their implications for residents, and how are these conceptualizations racialized? How does the involvement of longtime Bayview Hunters Point residents in the planning process rescale the implications of the upgrades to consider citywide and regional "African American out-migration" (Wilson 2012) trends? What practices avert emergent forms of racial inequity through infrastructure rebuilding?

I find that the transformation of environmental burdens into assets represents a shift in how infrastructure planning can support social justice—it is at once a stimulator of gentrification and a potential averter of displacement. Empirical data is derived from semi-structured interviews with public works officials, leaders of community-based organizations, and consultants from technical services firms; participant observation; and in-depth analysis of policy documents. My findings provide insight on how infrastructure rebuilding is implicated in larger citywide and regional trends, helping build theory on the link between infrastructure and racialization.

SUSTAINING COLLABORATION THROUGH INEVITABLE DISRUPTIONS: NAVIGATING TURNOVER IN LONG-TERM ENVIRONMENTAL MANAGEMENT COLLABORATIONS

Abstract ID: 505

Individual Paper Submission

BUTLER, William [Florida State University] wbutler@fsu.edu, presenting author

Collaboration in environmental planning and management contexts has become not only ubiquitous but increasingly mandated (Cheng 2006; Monroe and Butler 2016). As it has become more widely practiced, collaboration in environmental management has become an increasingly long-term endeavor. Environmental problems require notoriously long-term solutions to restore ecosystems and build resilience, opportunities to address uncertainties through learning and adaptive management efforts, and collaboration through implementation and monitoring to hold management agencies to account for the agreements established in planning phases (Margerum 2011). Some collaborative groups have now spanned decades.

In such contexts, collaborative groups will face inevitable disruptions. Principally among these disruptions is the simple reality of turnover. Collaborative groups that span many years inevitably face turnover due to retirements, promotions, fatigue, personal reasons, and numerous other events in people's lives. Agencies and organizations enter into collaborative arrangements, but often they depend on the individuals and relationships of specific participants in the collaborative to come to agreement and get things done. Others have written about the importance of trust and relationships in shaping collaborative accountability to ensure that agreements are adhered to by participating organizations (Weber 2003; Romzek et al. 2012). In a context that depends so extensively on relationships and trust to ensure accountability, turnover can test the collaborative's ability to effectively influence agency and organizational decision-making processes to ensure environmental management goals can be achieved.

In this paper, we examine this question through a series of comparative case studies of collaborative groups participating in the Collaborative Forest Landscape Restoration Program (CFLRP). Established in 2009, CFLRP is unique among federally mandated collaborative environmental management programs in that it requires collaboration through planning, implementation and monitoring and it comes with a budget allocation to support implementation of projects for a 10-year period and multi-party monitoring for 15 years. The program applicants had to demonstrate that they had undertaken successful collaborative projects before, so in most cases, the collaborative groups were well established and have now been engaging in new forest restoration work for 8 years on top of their previous collaborative work. In these cases, collaboration is required, but the authority and responsibility for restoration work rests on the US Forest Service on national forest lands.

Our research spans the first eight years of the program and identifies cases where turnover has been impactful to the group. Through analysis of transcripts from more than 120 interviews over time, we examine how they handled turnover of key personnel and participants to draw out lessons for collaborative sustainability and resilience. Turnover partly stems from the longstanding practice of the US Forest Service to move personnel from place to place to ensure that objectivity could be retained and collusion minimized. Our interviewees pointed to numerous staff positions changing, new forest supervisors cycling through, and a lot of "actings" [temporary

personnel] filling in. Changes in collaborative leadership likewise was experienced by several collaboratives and was particularly impactful when founding leaders or facilitators moved to another region and the collaborative had to recover their footing with new facilitators, new coordinators, and even a restructuring to account for the loss. In our cases, we seek to identify how participants reconstruct lines of communication, build trust and relationships among new parties, and reestablish a process for engaging in dialogue and making decisions that can sustain collaboration in the face of disruptions over the long-term.

USE OF DEEP MAPPING FOR CO-PRODUCTION OF KNOWLEDGES IN PLANNING: LESSONS FROM COVER CROPPING IN NORTH CENTRAL ILLINOIS

Abstract ID: 510

Individual Paper Submission

CORWIN, Charles [University of Illinois at Chicago] ccorwi3@uic.edu, presenting author

Planning, and particularly environmental planning and community development, calls for co-production of knowledges, in order to recognize many different voices and build relationships between people and organizations in changing environments. Actor network theory is an ontological framework for exploring the co-production of knowledges in material and natural worlds that has been used in studying scientific and technological systems and environmental change but is rarely applied in urban planning (Rydin, 2012). This paper draws on a case study of adaptation of cover cropping in agriculture from the perspective of actor network theory and a related methodology of deep mapping to make recommendations for planners on the use of deep mapping in understanding and participating in co-production of knowledges.

Actor network theory is often critiqued for its neglect of broader state politics and global markets, but it is useful in the context of knowledge production, community development, and agriculture because of its ontological orientation that draws in non-human actors as equal contributors to emergent adaptation strategies (Rydin, 2012; Schneider, Steiger, Ledermann, Fry & Rist, 2010). Actor network theory uses research tools, such as spatio-temporal maps and descriptive narratives (or deep mapping), to represent the activity of network building among key actors (Latour, 2005; Read & Swarts, 2015).

In this paper, I explore deep mapping as a methodology and performative activity to explore and represent the interactions among farmers, agricultural institutions, local ecologies, as well as the larger climatic and economic forces (Springett, 2015). Exploring such interactions in different cropping systems through actor network theory and deep mapping exposes the various actors, knowledges, and practices involved in network formation among a certain agricultural system (i.e., cover cropping). Following Read and Swarts' (2015) use of the theory, I ask the research question, how did cover crops come to be? To answer such question, I compare cover crop farming with conventional farming in the Vermilion River Watershed in Livingston and Ford County, Illinois. Doing so allows me to understand how co-production of knowledges and network building differ amidst a divergent adaptation strategy.

Initial findings from farmer and agricultural personnel interviews and field day visits suggest that economic and social factors are not causal indicators for farming behaviors, nor do such factors alone inspire

innovation or create new knowledges. Instead, a more nuanced form of knowledge production—through experimentation, tradition, collaboration, and scientific rigor—better describes the emergence of cover crops in my watershed. Soils, hydrologic features, climate, and farm policies also take active roles in the formation of the landscape and knowledge networks. To capture such intricacies, deep mapping uses farmers’ narratives, farmer created drone footage, farmer identified artifacts, and co-created visual representations of the landscape.

The purpose of this paper is to show that actor network theory offers important tools, such as deep mapping, for research on knowledge networks, community development, and agriculture. Through exploration of the particular case of cover cropping in north central Illinois, I demonstrate that deep mapping is also useful for exploring network building and knowledge co-production in community planning and development scenarios, especially in the context of environmental change.

THE PROCESS OF ECOLOGICAL PLANNING: A NEW MODEL FOR INTER- AND TRANSDISCIPLINARY SOCIAL-ECOLOGICAL COLLABORATION

Abstract ID: 519

Individual Paper Submission

ROTHFEDER, Robin [University of Wisconsin - Stevens Point] rrothfed@uwsp.edu, presenting author

In recent years, scholars across disciplines have increasingly focused on the overlap and integration of urbanism (planning, design, landscape architecture, etc.) with natural science (ecology, hydrology, geology, etc.). The reason is readily apparent. In an interconnected world dominated by wicked social-ecological challenges and opportunities, both built environment professionals and biophysical scientists must find new inter- and transdisciplinary ways of theorizing and conducting their work. Within urban and regional planning, this imperative has generally fallen under the broad heading of ecological urbanism or ecological planning.

While its general meaning is straightforward, there remains a pressing need to define ecological planning in clear, precise, and actionable terms. A particular challenge in this regard has been to understand ecological planning process: the phasing over time of actions and interactions by real collaborative teams. In the words of Nassauer and Opdam (2008), there is a “great need” to understand “the impact of different forms of scientific knowledge on the planning process” (p. 643).

What defines the process of ecological planning? At ACSP 2018, I will present the results of rigorous qualitative research aimed at answering this question. As Nassauer and Opdam (2008) explain, it is a question that must be addressed by diagramming (visually) how the workflow of science and urbanism can integrate and intersect. Several recent scholars have taken this approach, including Steiner (2008), Childers et al. (2015), Felson et al. (2013), Hinnert et al. (n.d.), and Nassauer and Opdam themselves. Each of these process models is a box-and-arrow diagram, which shows the relationships between actions and/or actors in a stepwise fashion. Each one reveals much about how science and the built environment can fit together. However, these and other existing

process models also exhibit two consistent drawbacks: 1) a graphic format that struggles to convey the underlying depth, clarity, and complexity of thought, and 2) an emphasis on uniqueness, based upon a small set of complicated case studies, as opposed to broader interdisciplinary consensus-building and synthesis.

In contrast, this research employs semi-structured interviews with 18 ecological planning experts from both academia and professional practice, including ecologists, biologists, geologists, engineers, planners, designers, landscape architects, and real estate developers. Coupled with these interviews are online and in-person interactive diagrams: a firsthand picture of each participant's workflow process. Through methods of transcription, coding, content analysis, and graphic design, the final research product synthesizes these individual insights and diagrams into a new model of ecological planning process. This model uses a unique graphic format that is more dynamic, flexible, aesthetic, and comprehensive than existing box-and-line diagrams, and that is more thoroughly grounded in a broad expert consensus. Within this new definition of ecological planning process, conference attendees will find specific and important roles for themselves (as planning scholars and practitioners) to fulfill: collaborating in inter- and transdisciplinary teams at the intersection of science and urbanism, both creating social-ecological knowledge and reciprocally shaping the form and function of the built environment.

LOCAL KNOWLEDGE LANDSCAPES: UNDERSTANDING CURRENT PROGRESS AND ONGOING NEEDS TO BUILD RESILIENCE IN COASTAL CALIFORNIA

Abstract ID: 534

Individual Paper Submission

HIRSCHFELD, Daniella [UC Berkeley] daniellah@berkeley.edu, presenting author

HILL, Kristina [UC Berkeley] kzhill@berkeley.edu, co-author

RIORDAN, Bruce [Climate Readiness Institute] bruce@climatereadinessinstitute.org, co-author

Theoretical Context and Questions

There is strong agreement in the climate adaptation literature that some transformations in infrastructure systems, social systems, economic systems, and governance systems are needed to build long-term resilience (Kates et al., 2012). Moreover, many recognize that local governments will be on the leading edge of these resilience building efforts (Meerow et al., 2016). While authors such as Moser and Tribbia (2007) note that we need more than just information to create such changes, the current literature does not sufficiently address the specific strategic intervention points that will allow local jurisdictions to achieve these transformations. In this context our research explores three critical questions regarding knowledge systems and sea level rise planning: 1) What is the current quality of each region's sea level rise planning efforts? 2) What regional differences lead to various level of progress? and 3) Where are the knowledge opportunities for intervention?

Approach & Methods

In this project we address this knowledge gap with special attention to empirical data and research into 'on-the-ground' practice. Specifically, in our project, we develop a quantitative assessment framework build on prior

work by Woodruff and Stults (2016) and Baker et al. (2012) to determine the current quality of sea level rise planning efforts and identify the opportunities for intervention. We use a mixed methods approach to characterize seven aspects – written plans, physical infrastructure projects, public awareness, social justice, governance, and use of science – of resilience building progress at the local government level. We used web searches, written surveys, and group and individual interviews with key sea level rise stakeholders to gather and analyze the quality and content of local progress.

Preliminary Findings and Contributions

Our preliminary findings show that while regions are making planning progress, the extent and quality of that progress varies widely. Some regions are leading the way in terms of high quality vulnerability assessments, while others are stronger in terms of implementation of policy changes. Additionally, while there has been progress on public engagement, we find that all regions struggle with engaging vulnerable populations. We also find that regional variations are primarily driven by resources available, public pressure for action, and the presence of local champions. This work contributes to the literature on climate adaptation planning and local practice, by proposing a method for quantitative comparison of coastal communities in the context of sea level rise. Moreover, by closely examining local progress on sea level rise adaptation planning, we shed new light on critical areas for strategic intervention to develop resilience in the face of climate change.

NEEDS ASSESSMENT OF WATER-RELATED DECISION SUPPORT TOOLS

Abstract ID: 555

Individual Paper Submission

SHAH, Sagar [American Planning Association] sshah@planning.org, presenting author
READ, Anna [American Planning Association] aread@planning.org, co-author

Communities face a range of water-related issues, from flooding and stormwater management to drought and insufficient quality water. Uncertainty associated with climate change exacerbates these issues, and we need tools to make effective development decisions based on current and future climate events (Quay 2010). Geospatial models and scenario planning tools are becoming an indispensable part of a planner’s toolkit because of their ability to visualize and analyze the potential impacts of water on populations, natural resources, and infrastructure (Nay et al. 2014).

NOAA’s Office for Coastal Management funded the American Planning Association to conduct a needs assessment of water-related decision support tools (DSTs) to help planners make land use decisions. The goal of the study was to identify needs of practicing planners that are not being addressed by existing DSTs, so that new DSTs can be designed to fill the gap. Based on this goal, the study addresses three questions: i) Which key issues

are not addressed by the existing water-related DSTs?, ii) Which aspects of DSTs make them useful and what are the challenges associated with using them?, and iii) If new DSTs are created, on which water issues should they focus on and what should be their features?

The needs-assessment methodology was as follows: first, we reviewed existing needs assessments of water-related DSTs in both the grey and academic literature. Second, we convened a one-day stakeholder workshop (n = 38). The stakeholders included APA members working in planning practice (users), members representing national organizations (subject experts), and DST designers (software developers). The workshop involved large and small group facilitated discussions on pre-selected questions. Third, we conducted a survey of practicing planners and professionals working on water-related issues to understand their needs and perspectives regarding DSTs.

The literature review, workshop, and survey provided several insights about how to support planners in their water-related work. There are a wide range of existing DSTs related to water (The Trust for Public Land 2015). However, this study shows that they are not user-friendly, do not allow analysis at different scales, and cannot be integrated with other tools. The end-users want DSTs that allow integration of existing tools (e.g., FEMA floodplain maps), increase awareness of existing DSTs especially related to flooding and green infrastructure, and provide additional training on how to use DSTs.

The study also demonstrates that practicing planners spend only a part of their working time on water-related efforts and they want tools that can be easily used to analyze issues related to flooding, green stormwater infrastructure, and water supply. Based on their feedback, we recommend development of two types of tools: 1) Tools to understand flood impacts from multiple sources (e.g. coastal and riverine flooding). This can help planners better understand potential flood impacts on existing and proposed development; and 2) Tools to understand the impacts of low-impact development (LID) or green infrastructure interventions on stormwater management. These tools could support analysis of existing and proposed site conditions and impacts of LID and related changes on impervious cover. In addition to being a standalone tool, such tools could also be added to the existing DSTs such as National Stormwater Calculator and Stormwater Management Model.

The challenge for the future tool development is to create DSTs that are user-friendly but are simultaneously multifaceted and can be used to perform more than just one type of analysis.

In this study we identify the keys to successful implementation of community-wide climate action plans in the U.S. In addition, we examine how implementation has evolved and matured as climate action planning becomes institutionalized. The emergence of climate action plan (CAP) development has been a frequent subject of research over the last five to 10 years (e.g. Bassett & Shandas 2010; Stone et al, 2012; Shi et al. 2015). These efforts describe the content, context, quality, and need for such planning. Because most CAPs are less than 10-years old, there have been few opportunities or efforts to evaluate implementation and effectiveness. In 2012, the authors conducted a survey, plan assessment, and follow-up interviews with cities that had adopted a CAP. In this research, the survey, plan assessment, and interviews are repeated 5 years later with an added focus on implementation methods, lessons learned, and effectiveness.

Surveys on CAP implementation were sent to 105 U.S. communities in 2012 (representing the known population of CAPs at the time) and there was a 48% response rate. A revised survey focused on changes and lessons learned was sent in 2018 to the 50 respondents from the 2012 study. The initial survey identified keys to success for plan development and implementation including cultivation of broad based community support, diverse funding sources, and institutionalization of climate planning. This initial study was limited, though, because most communities were very early in the implementation phase and had little to report. This follow-up study offers a new perspective on climate planning as there are now cities with six or more years of implementing their plan. Many of the measures in a CAP have prolonged implementation periods, as well as lengthy period of time needed for intended outcomes to be observable. This research seeks to identify lessons learned through prolonged pursuit of climate planning goals. The research seeks to discover where have these cities experienced the most success and to what factors do they attribute this effectiveness. In addition, how these plans and the implementation of them have changed over time will be assessed.

FLOWING VALUES: COST RECOVERY, CONSERVATION, AND SOCIAL EQUITY IN U.S. DRINKING WATER PROVISION

Abstract ID: 612

Individual Paper Submission

HOMSY, George [Binghamton University] ghomsy@binghamton.edu, presenting author

WARNER, Mildred [Cornell University] mew15@cornell.edu, co-author

GASTEYER, Stephen [Michigan State University] gasteyer@msu.edu, co-author

Central theme: In the United States, a sophisticated system of drinking water delivery has developed over more than a century that provides healthy, high quality of water to a majority of residents. But the benefits of that high quality system are not felt by all citizens. Recent experiences in Michigan and Kentucky illustrate that water shutoffs and threats of water system privatization leave many low income and minority communities with inadequate or unhealthy supplies (Vanderwark 2012). Most research into the environmental justice issues around drinking water have been important, but limited, case studies (e.g. Butler, Scammell, & Benson 2016). Many of these have started to show that while drinking water quality makes the headlines, the cost of water to customers is an increasingly important issue (e.g. Colton 2017). At the same time, local governments, which own the majority of public drinking water systems in the US, must wrestle with keeping operations financially solvent and recognize the growing importance of water conservation in increasingly resource constrained regions. In this paper, the authors describe the characteristics of those communities that seek to protect low-income residents from water shut offs and those that seek to implement a range of water conservation measures.

Methodology & findings: Using a 2015 survey of local governments from across the country (n=1,899) in a pair of logistic models, we find that government-owned utilities are more likely to both protect residents from water shutoffs and increase water conservation efforts. However, state regulators of publicly-owned utilities, public utility commissions, seem to push these local operations towards full cost recovery at the expense of social equity and environmental conservation. Suburbs tend to have a higher likelihood of implementing shutoff protections versus urban areas, where such protections are more important to low-income families. Local governments that experienced a drought are more likely to conserve water. Communities with social equity expressed as an explicit planning goal are more likely to protect low income households, yet having environmental protection as a priority does not increase conservation. The research points to the importance of publicly-owned water utilities in balancing the three dimensions of sustainability and the struggles utilities face as they are held to high cost recovery standards. It also indicates the importance of communities articulating social equity goals to provide a framework for decision making around the provision of public services.

Relevance: Engineers and water system managers often oversee infrastructure, but planners are often tasked with coordinating local land use and sustainability policies (Andrews, Popper, Lowrie, and Stiles, 2018). Yet, even in small- to medium-sized municipalities, the provision of basic services is a complex task with pressures to balance fiscal solvency, social equity, and environmental protection. As pressures increase to privatize water systems, local governments need to understand the value of municipally-owned operations versus those owned by investors.

TRANSFORMING INCINERATORS INTO COMMUNITY AMENITIES? THE SEOUL EXPERIENCE

Abstract ID: 656

Individual Paper Submission

LAURIAN, Lucie [University of Iowa] lucie-laurian@uiowa.edu, presenting author

HAN, Albert [University of Calgary] albert.han@ucalgary.ca, primary author

GO, Min Hee [Ewha Women's University] minniego@gmail.com, co-author

This paper explores the possibility that pairing desirable community amenities with polluting, industrial, or otherwise unwanted sites such as waste incinerators, may have the potential to mitigate or even compensate for negative local impacts. The environmental justice literature shows that polluting sites tend to disproportionately affect low income and disenfranchised communities. Could this be reversed by linking positive amenities to polluting sites? The South Korean experiment with building community amenities (recreation centers, pools, gyms etc.) at waste incinerators may provide answers to this intriguing question.

Municipal waste incinerators are typically considered Locally Unwanted Land Uses (LULUs) because of the toxic air pollutants they emit and the truck traffic they generate. Yet, many nations, in particular in Northern and Western Europe, as well as Japan and South Korea rely heavily on incinerators for waste management. Modern incinerators are typically waste-to-energy facilities, generating heat and power fed back on the grid or distributed via district heating infrastructure. Air quality and public health impacts – the major concerns being heavy metals

and dioxin emissions- are mitigated via strict regulatory standards and through Best Management Practices, mainly high temperature combustion, filters and scrubbers.

Despite these advantages and BMP advances, incinerators continue to pollute (it is not unusual for incinerators to fail emissions standards), and are necessarily associated with garbage truck traffic. In addition to well-documented health and environmental impacts, incinerators –as other LULUs- can negatively affect neighborhoods' reputations and lower local land and housing values.

In this context, we explore the unique case of South Korea, the only country to our knowledge that associates positive community amenities to the construction of waste incinerators to mitigate their negative impacts. The Seoul Metropolitan Area (SMA) hosts about 50% of the South Korean population, and 17 of its 49 waste incinerators. In 2013, nearly 2 million tons of waste were incinerated in these facilities (about 59% of the waste generated nationwide). These incinerators generate heat (1790 GJ) and electricity (120,000 Mwh) distributed to local communities at a discounted price or put back to the grid. Some of these incinerators were built to include swimming pools, gyms and community recreation centers, thus transforming them into community assets. This has the potential to compensate for the negative health impacts of incinerators that may persist (even though they are assessed as negligible in Government studies) and for the negative impacts incinerators may have on neighborhood perceptions and local property values.

We explore the impact of these innovative strategies on the effects incinerators have on local land and property values. We hypothesize that the transformation of LULUs into community amenities may minimize or even render positive the impacts of incinerators on local land values and housing market. We also hypothesize that given these compensation mechanisms, the populations of incinerator impact zones may not be disproportionately socio-economically disadvantaged compared to those in the rest of the metropolitan area, i.e., we may not be seeing environmental injustices in incinerator siting patterns in Seoul.

To test these hypotheses, we employ difference-in-differences (DID) analyses using land prices, property tax values, and socio-demographic characteristics at the district, or gu, level for 2000 and 2010. We ran two DID models, one testing the difference between districts affected by incinerators built with amenities (treatment group) and those without incinerators (control group); and the other testing the difference between districts affected by incinerators built with amenities (treatment group) to those built without community amenities (control group). We present the results of this analysis and its implication for planning practice, not only for incinerators, but potentially for other types of polluting facilities as well.

TRANSFERRING GLOBAL CLIMATE CHALLENGES TO LOCAL PRIORITIES IN A DEVELOPING CONTEXT: A CONTENT ANALYSIS OF LOCAL-CARBON ACTION PLANS OF 55 CHINESE CITIES

Abstract ID: 801

Individual Paper Submission

LIU, Zhilin [Tsinghua University] zhilinliu@tsinghua.edu.cn, primary author
CHEN, Heyin [Tsinghua University] chenheyin9494@163.com, presenting author
DAI, Yixin [Tsinghua University] yixindai@tsinghua.edu.cn, co-author

Climate change poses a global threat to the long-term sustainability of the human society. With international collective action largely stalled and nations struggling to fulfill their greenhouse gas reduction commitments, cities are increasingly recognized as the groundbreaking force in addressing climate change. Cities are better positioned to adopt locally-tailored, innovative measures to achieve the congruence of local priority and global sustainability. An emerging literature has sought to identify motivations of local climate policy adoption and assess the quality of local climate plans. Most studies, however, have drawn from empirical analysis of cities in Western Europe and North America, which are primarily post-industrialized, democratic countries with greater local autonomy and less pressure on industrial growth. Relatively little knowledge has been offered with respect to local climate actions adopted by cities in China, which not only is the world's biggest greenhouse gas emitter but also face severe environmental problems in multiple fronts on its own.

This paper presents a content analysis of local low-carbon action plans adopted by Chinese cities, an equivalent of local climate action plans. Unlike in Western cities where climate actions tend to be locally initiated, in China, the National Development and Reform Commission in 2010 started a low-carbon city pilot program (LCCP) to stimulate local actions to address global climate change and achieve low-carbon development. This program to date has included 70 cities over three phases (2010, 2012, and 2017), which were required to make and implement a low-carbon city action plan. We collected the action plans for 55 pilot cities through a combination of online search engine (for publicly released plans) and government information disclosure request. We conduct quantitative content analysis to assess the quality of these plans including policy areas, targets, projects, and policy instruments. A preliminary analysis has revealed that only a small number of cities have specifically included global climate change as an organizing concept for the plan.

Further analysis thus seeks to investigate the relationship between global climate change awareness and the quality and of the action plans. Specifically, we seek to test the following hypothesis: cities with greater awareness of global climate change – i.e. using climate change as an organizing concept, as well as analyzing the impacts of climate change to local development – are more likely to develop a low-carbon action that is more comprehensive – i.e. involving not just the industrial and energy sectors but also residential building, transportation, and daily life consumption, and more feasible – i.e. with specific targets, actions, and projects in each policy area. In addition, we also test whether plan quality is associated with the city's economic and environmental conditions as well as prior experience of international cooperation, particularly collaboration with international organizations and developed countries.

Our research offers an empirical assessment of local climate action plans of Chinese cities and, by comparing with similar plans in Western cities, contributes to the international literature on the role of local cities in addressing the global challenge of climate change.

DECISION SUPPORT FOR URBAN CLIMATE ADAPTATION PLANNING ACROSS SCALES: LESSONS FROM NORTH AMERICAN CITIES

Abstract ID: 820

Individual Paper Submission

OMUNGA, Philip [Savannah State University] omungap@savannahstate.edu, presenting author

Despite the growing number of urban adaptation planning initiatives for responding to the effects of changing climate (e.g. sea-level rise) and extreme events (e.g. drought and flooding) on built environment, water quality and resource protection, and public health, recent research suggest there exist significant barriers related to implementation uncertainties that hinder translation of adaptation plans into actions (Bierbaum et al., 2012; Biesbroek et al. 2013; Carmin et al, 2012; Preston et al. 2010). This paper argues that overcoming the implementation uncertainties will require decision support tools that generate better and well-informed choices of specific urban climate adaptation options. Thus, it becomes imperative to understand what determines the choices of urban climate adaptation options across a variety of scales.

This paper presents evidence drawn from a systematic review of urban adaptation planning initiatives between 2008 and 2013 across North American cities. The modified Driver-Pressure-State-Impact-Response model published by Rounsevell, Dawson, and Harrison in 2010 provided a robust framework for structuring relevant data from specific cases for analysis using descriptive statistics and binomial logistic regression to generate objective and generalizable outcomes.

The review findings suggest that anticipation of economic benefits, perception of risks to management and conservation of urban natural resources, need to protect and support of human and social systems, and improvement of policy and regulations were significant predictors of the choice of specific adaptation options (namely enhancing adaptive capacity; management and conservation; and improving urban infrastructure planning and development) across a variety of scales. This does not imply that other factors such as information and knowledge; perceived funding and economic opportunities; evidence of climate change effects have insignificant relationships with the choice of adaptation options, only that the review did not find evidence to support such claims.

These findings offer useful guidance to future design and development of decision support tools that could generate viable robust adaptation options while taking account of uncertainties surrounding implementation of effective climate adaptation actions, especially in regions where urban adaptation plans are weak or absent.

THE POLITICS OF SCALE IN SPATIAL PLANNING PRACTICE

Abstract ID: 866

Individual Paper Submission

MILZ, Dan [Humphrey School of Public Affairs, University of Minnesota] dcmilz@gmail.com, presenting author

The politics of scale asserts that scale is socially constructed and politically contested. The scales chosen for diagnosing water quality degradation, for the application of wastewater management policy, or for the construction of green infrastructure are negotiated outcomes of planning and policy-making processes. Even when “natural” alternatives (i.e., watersheds) are present, the complexity of social-ecological systems provides a plethora of scales that are all, more-or-less, natural (Milz, Zellner et al 2017). Thus, stakeholders and decision-makers are required to sift through all these various scales and the interactions that ripple across them. Therefore, the politics of scale relies on the spatial judgments of stakeholders, and scale becomes the product of their “...incessant judgment, subject to critical argument” (Rittel and Webber 1972, p. 162). A scale once adopted becomes reified through practice as planners and policymakers work together using that scale to guide their deliberations.

In spatial planning practice, selecting one scale over another, while reducing the conceptual complexity of the problem, may blind planners and policy-makers to dynamics and solutions at other scales (Cohen & McCarthy 2015). Moreover jumping to the conclusion that a single scale was chosen via a contested political process dominated by powerful interests provides limited advice for practitioners faced with complex problems. However, viewed as an institutional re-design process (Simon 1996; Ostrom 2005), planning and policy-making processes are fertile ground for exploring the unfolding dynamics of the politics of scale. Moreover, understanding these process, in detail, can demonstrate how doing scalar politics need not be an exercise in futility—planners and policy-makers can get scale right without having to pick the right scale.

This paper explores how spatial judgments impact planning and policy-making by studying how a group of stakeholders relied on a pair of cognitive strategies to consider cross-scale relationships (Walker, Gunderson et al 2006). Analysis of video data from community planning workshops dissects the spatial judgments of stakeholders on Cape Cod, Massachusetts as they developed a “regional” or “area-wide” wastewater management plan. Detailed analysis of their deliberations shows a much more complex and dynamic portrait of their scalar politics than one would presume via a casual reading of their adopted plans and policies. This paper demonstrates the wide range of spatial judgments stakeholders may be capable of applying as they make plans for complex social-ecological systems.

MEASURING ENERGY AND AIR QUALITY IN PUBLIC HOUSING SITES DURING HEAT WAVES

Abstract ID: 873

Individual Paper Submission

Earth's warming climate gradually increases the likelihood of extreme heat weather events, which can lead to intensified urban heat island effects, higher demand for energy, and worsened air quality both outdoors and indoors [Horton, 2014, IPCC, 2014, Wilby, 2007]. With more intense and frequent heat waves, there is a growing concern for vulnerable populations such as the elderly, and especially those elderly residing in highly urbanized or industrialized areas, with inadequate living conditions and poor access to resources [Belanger, 2015, Zanobetti, 2012].

Our work examines how senior public housing sites perform under heat waves, relative to energy, air quality and well-being. We draw from an empirical study conducted in Elizabeth, NJ, which has the worst air pollution in the state. Our sample consists of 24 apartments and their senior residents, located within 3 different sites; each belongs to a different neighborhood and can be separated from the rest in terms of surroundings, building envelopes, and the residents' profiles. The first 2 include conventional multifamily buildings while the 3rd includes a LEED-rated residential building. Our data come from interviews with the residents (household conditions, socio-demographics, health, heat coping actions) and from sensors installed in the seniors' apartments and outdoors (temperature, humidity, CO₂, PM, ozone, window operation, occupancy, A/C use). Additional information includes apartment and building envelope attributes (number of windows, floor area, height, orientation, HVAC systems etc). All data were gathered during April-October, 2017.

In this paper, we argue that a number of social-ecological factors, such as the local climate and the site characteristics including building systems, social context and individual agency, may jointly affect the heat coping processes; however, some components may be more important determinants to energy use and air quality indoors. The premise that the site defines the seniors' behavior, which may contribute equally or more than infrastructure performance and the outdoor climate suggests that we take an in-depth analysis of the spatio-temporal patterns underlying the variables of interest.

The results of our multi-level regression models illustrate how adaptable different population segments are to heat waves as a function of personal, building and site level, and local climatic characteristics. The outcomes support our hypothesis and suggest that 1) energy use relies heavily on outdoor temperature and building/site attributes, with interestingly low values on the LEED-rated site with central A/C and an overall better building envelope, and that 2) air quality variables like PM and CO₂ have significant links to behaviors, such as smoking, lighting candles/incense, having pets and inadequately ventilating; those are mainly observed in the residents of the two conventional sites, who take more adaptive actions, both indoors and outdoors.

Our findings highlight the importance of human agency in the heat adaptation process, as it is not just about the infrastructures and the adjacent physical environment, but also how people end up using them. They further imply the need for integrated solutions to the heat waves problem across scales; from changes to residents' habits, to building envelope modifications and building operations, and to outdoor space alterations. We provide guidance for communities who seek to transform their built environments along with informing individual behaviors, and we highlight the value of joint collaborations among residents, infrastructure designers, and public officials.

SCENARIO-BASED STORMWATER MANAGEMENT PLANNING SUPPORT SYSTEM FOR COMBINED SEWER OVERFLOWS (CSOS): A CASE STUDY IN CINCINNATI, OHIO FOR A SINGLE CSO POINT

Abstract ID: 874

Individual Paper Submission

FU, Xin [National Risk Management Research Laboratory, U.S.EPA] fxi@mail.uc.edu, presenting author
 WANG, Xinhao [University of Cincinnati] wangxo@ucmail.uc.edu, co-author
 HOPTON, Matthew [National Risk Management Research Laboratory, U.S.EPA] Hopton.Matthew@epa.gov, co-author

Combined sewer systems (CSSs) are designed to discharge excess untreated water to natural water ways when the combined flow exceeds the capacity of the wastewater treatment system that still serves as a common urban conveyance method in many cities around the world, especially in old towns (Liao, Zhang, Wu, He, & Chen, 2015). Combined Sewer Overflows (CSOs) contain pollutants that can cause serious environmental problems and public-health risks (U.S.EPA, 2014). Green Infrastructure (GI), which can infiltrate, store, and/or detain stormwater at different levels, has been integrated with existing Gray Infrastructure (GrayI, such as gutters, pipes, and drains conveyance and storage facilities) to overcome CSO problem in urban areas (Carpenter, Todorov, Driscoll, & Montesdeoca, 2016). However, there lacks an objective-oriented planning framework from the angle of whole watershed or sewershed aiming at eliminating CSOs. Although the GIs present many advantages on managing runoff, the combination of GIs and GrayIs for solving CSO problems cannot be overlooked. Moreover, the existing spatial units in stormwater simulation, such as catchment areas, place barriers in GI implementation and public participation. Variations within a catchment for spatial distribution, attribution, ownership, and management of GIs are not clearly informed.

To address above gaps, we developed a scenario-based Stormwater Management Planning Support System for CSOs (SWPSS-CSO). The goal of the SWPSS-CSO is to provide a platform for coordinating the installation of GI and GrayI to eliminate/reduce CSOs of a specific watershed or sewershed. The analysis is parcel-based and provides GI's exact amount (retention volume or pervious area), location, associated ownership, costs of construction, and maintenance. Researchers, planners, utility managers, community leaders, and the general can use the SWPSS-CSO to participate in GI planning process to address runoff control and enhance community quality.

The SWPSS-CSO was developed using CommunityViz (v5.0), a planning support extension of ArcGIS, and applied to CSO #488 sewershed in Cincinnati, Ohio as a case study. It consists of three components: scenario generation, scenario modeling, and scenario comparison. One baseline scenario and three alternative scenarios are developed. The baseline scenario presents a sewershed with existing CSS without any GI installation. The three alternative scenarios represent an increasing use of GI by adding practices to the preceding scenario: 1) installation of rain barrels and green roofs on private parcels; 2) installation of porous pavement on private driveways and paved parking; and 3) installation of porous pavement on sidewalks and retention basins on public-owned land. The suitability analysis of each type of GI is based on drainage area, slope, hydrologic soil group, stream buffer, and roof type (U.S.EPA, 2004). Runoff, time of concentration, and peak flow rate are simulated using USDA TR55---Urban Hydrology for Small Watersheds (NRCS, 1986). Results show the third alternative scenario has the best performance among four scenarios by mobilizing 97.25% private parcels and 27.59% public

parcels to attend GI installation, reducing almost 41% runoff comparing to the baseline scenario, and dropping the peak flow rate to 226.19 cfs, under rainfall event of 5-year recurrence interval. However, to eliminate the CSO problem, tanks (GrayI) are needed with 22.57 ac-ft storage capacity. Although GrayIs still play important roles in controlling CSOs, GIs can add meaningful capacity to the stormwater system.

The SWPSS-CSO can further be applied to test more scenarios for other watershed or sewershed, such as scenarios for extreme rainfall event related with climate change, future land cover change, and new types of GI. In addition, the SWPSS-CSO is an open system that allows users to customize objectives, models, indicators, and parameters for runoff-related decision-making needs.

PLANNING IMPLICATIONS OF CLIMATE CHANGE: A CASE STUDY FOR LOS ANGELES COUNTY, CALIFORNIA

Abstract ID: 878

Individual Paper Submission

KIM, Sungyop [University of Missouri - Kansas City] kims@umkc.edu, presenting author

SUN, Fengpeng [University of Missouri - Kansas City] sunf@umkc.edu, co-author

IRAZABAL-ZURITA, Clara [University of Missouri - Kansas City] irazabalzuritac@umkc.edu, co-author

Intensifying climate change calls for attention on who will be affected by climate change in cities and how (Reckien et al., 2017). While planning is increasingly paying attention and contributing to the rapidly increasing literature on climate change adaptation and mitigation, it has paid little attention to understanding vulnerability to heat and its intervention measures. Yet, heat is far more deadly and damaging to health than any other weather event. Climate scientists have been developing and exploiting numerical models to project climate change, e.g., rising temperatures, however, their efforts have not yet been successfully translated into planning practice. Also, the usage of climate change information by planners and policymakers has barely occurred.

Integrating heat projections with demographic and socio-economic data, this study analyzes potential impacts of climate change at a micro-level geography and presents critical planning issues that need to be addressed in the era of climate change. We employ a high-resolution (1.24x1.24 mi or 2x2 km grid) climate data that includes the projected changes in 6.56-foot (or 2-meter) surface air temperature and the number of extreme heat days (daily maximum temperature greater than 95°F) between the baseline period (1981–2000) and the mid-21st-century period (2041-2060) in Los Angeles County, California. The climate data is based on a hybrid dynamical–statistical climate downscaling model (Sun et al., 2015; Walton et al., 2015). This climate data considers a “business-as-usual” scenario, i.e., Representative Concentration Pathway RCP8.5 scenario, in which greenhouse gas emissions continue to increase throughout the twenty-first century (Meinshausen et al. 2011).

We found a significant micro-level geographic heterogeneity in surface air temperature and the number of extreme heat days associated with climate change. The inland regions in the study area are expected to face more severe impacts than the coastal area by mid-century. This implies that increasing suburbanization may aggravate the impacts of climate change. Also, we found that low-income minority populations in the Los Angeles County will be more significantly impacted by extreme heat events. The increases in surface air temperature and the number of extreme heat days are much more likely to happen in suburban and exurban areas with a high concentration of low-income and Hispanic populations if current geographic distributions of these populations continue.

The study presents substantive planning and policy implications. Temperature increase and extreme heat days may not occur uniformly. The micro-level climate change data can provide information about potential impacts and indicate areas where more serious impacts will concentrate. Therefore, this high-resolution data should be part of planning data analyzed for local and regional long-range comprehensive plan making. Heterogeneous locational impacts of climate change may require a new dimension on equity planning and environmental justice. Surface air temperature increases, in particular extreme heat days, will have more negative impacts on the quality of life among disadvantaged community members. Mitigation and adaptation strategies should be specifically developed for this disadvantaged community. Finally, to improve climate sustainability and justice, certain local areas may need to be discouraged for developments. Continuing suburbanization and new development in exurban areas may need to be discouraged, while local areas with the least impacts may need to develop inclusive development strategies. This would require regional approaches in planning for future development and the retrofitting of existing built environments in the era of climate change.

ENVIRONMENTAL JUSTICE IN WAREHOUSING LOCATION ACROSS CITIES: INSTITUTIONAL PERSPECTIVES

Abstract ID: 884

Individual Paper Submission

YUAN, Quan [University of Southern California] QUANYUAN@USC.EDU, presenting author

In response to the growing demand for goods movement, the warehousing industry has experienced an unprecedented expansion in the major metropolitan areas. Such strong and widespread growth has profound environmental and social implications. An increasing number of recent research revealed that warehouses are disproportionately located in minority neighborhoods, and it becomes a rising environmental justice problem that calls for a systematic examination. It is increasingly evident that the spatial inequity exists not only at the neighborhood level, but also between municipalities. The existing research, however, failed to present how municipal institutional factors play a role in the dynamics that cause the environmental inequity. After all, local governments make siting decisions, and their interventions and policies have strong and long-term effects on land

use patterns. These effects are too critical to be ignored in evaluating the environmental justice problem in warehousing location.

In this study, I first identified local public policy elements that affect the location choice of warehousing facilities by reviewing relevant literature and interviewing planners, warehousing developers, and regional agency staff. Then I evaluated the relationship between these policy elements and warehousing development using qualitative city-level data from the Los Angeles region. In this step, I decoupled the local institutional factors from other factors in the warehousing location choice by comparing municipalities which have similar socioeconomic characteristics but different trajectories of warehousing development. With this research design, I was able to recognize how divergent policy making contributes to the gaps in warehousing intensity between municipalities.

Results showed that land use policies (e.g. industrial zoning, land parcel division rules), job related policies (e.g. job creation initiative, job density requirements), financial incentives (e.g. tax rates, financial incentives), and environmental regulations (e.g. building design, buffering between conflicting land uses, landscaping) are the major policy elements that impact warehousing development. There is, however, no evidence showing that local policies have played a major role in linking low-income and minority population with warehousing related externalities so far.

However, as the growing warehousing related environmental threats have caused more and more concerns among local residents, local policies would potentially become a major drive towards environmental inequity in warehousing location. More affluent and educated residents are more likely to organize and lobby the local authorities for anti-warehousing policies. Variations in demographic and socioeconomic characteristics including income, race, and education attainment may eventually be translated into variations in warehousing related policy making and intensity of warehousing development. The currently significant gap in warehousing externalities between municipalities may even widen, making the environmental justice problem more severe.

What should local governments do to cope with the problem after all? First, they should get familiar with how warehousing development is affected by local policies, and how warehousing causes environmental hazards. Second, local governments need to review the current policies, evaluate their socioeconomic resources and capacities, and make practical plans to balance the benefits and costs from warehousing development. Third, local governments may need to work together to reduce the spatial inequity in warehousing location. Regional collaborations can help address the problem. Cities can learn from each other and adopt the most appropriate policies according to their own circumstances. Finally, local governments may consider establishing a policy discussion forum where residents, environmental agencies, regional organizations, and the private sector can sit together to generate policies that are both acceptable to all parties and effective in achieving the shared goals.

SOURCE WATER PROTECTION PLANNING IN THE MIDWEST

Abstract ID: 945

Individual Paper Submission

WILSON, Jessica [The ohio State University] wilson.3499@osu.edu, presenting author

Amendments to the U.S. Safe Drinking Water Act in 1986 and 1996, required states to create source water assessment programs and conduct source water assessments for all public water systems using groundwater wells (1986) and surface water sources (1996). Source water protection involves keeping drinking water sources clean and fit for human consumption. Impacts from increased urban development, population growth, and climate change all directly challenge the future of drinking water quality and quantity in cities. Connections between land uses and water quality have been well documented, as have participatory planning efforts to protect water quality at the watershed-level (Sabatier et al., 2005; Conroy, 2011). At the same time, studies in planning and environmental management literature have noted a disconnect between water management and land use planning, especially under jurisdictional fragmentation, challenging management efforts (Kim et al., 2015).

While the regulation of drinking water protection in the U.S. is not new phenomenon, there is limited research into the planning and implementation processes utilized by local planning departments and water utilities (Lindsey & Schoedel, 1997). US EPA and state guidance stress collaboration and participation of state and local agencies and stakeholders during the assessment and planning processes (US EPA, 2002). However, it is unclear who is actually involved in the protection planning process, and what collaborative efforts, if any, take place. It is also generally unclear what specific integration (across water and land use management) is necessary to protect drinking water, and what role planners serve in larger institutional and governance processes to protect drinking water sources. As such, this study builds on previous work and asks: how do water and land use governance structures interact during the source water protection planning process?

The methodology for the study includes two parts: a document analysis and survey. The study sample (n=256) includes a total of 128 public water suppliers, as well as their municipal planning department counterparts in five Midwestern states: Ohio, Indiana, Illinois, Michigan, and Wisconsin. These suppliers use either groundwater, surface water, or a mixture of both, but do not withdraw water from the Great Lakes and do not purchase water from another utility or private company. First, I review the most recent source water assessments, protection plans, and associated local comprehensive plans and land use ordinances to examine the elements of protection plans, understand organization across plans/ordinances, and to inform the survey instrument design. Next, I survey water utility managers and city planners to examine the most recent assessment and protection planning processes, analyze connections and integration across local planning efforts, and examine local opportunities for and barriers to successful source water protection.

Results from this research are expected to inform planning practice related to “land-water nexus” and collaborative planning, including identifying explicit points of planning intervention into source water protection. Additionally, the work is most relevant to the recent update to the APA Water Policy Guide that calls for an integrated approach to water management and related policies.

CHARACTERIZING LONG-TERM CHANGES IN URBAN GREEN INFRASTRUCTURE: A COMPARATIVE STUDY OF THE COLUMBUS AND ATLANTA METROPOLITAN AREAS

Abstract ID: 953

Individual Paper Submission

PARK, Yujin [The Ohio State University] park.2329@osu.edu, presenting author

GULDMANN, Jean-Michel [The Ohio State University] guldmann.1@osu.edu, co-author

Urban growth has been coupled with the erosion of open green spaces. The environmental footprints of sprawling developments include the loss of ecological and social services provided by urban green spaces (UGSs), such as mitigation of extreme temperature and air pollution, reduction of surface run-off, and habitat conservation (Lynch, 2016). However, beyond the simple loss of greenness, metropolitan areas have expanded their built-up surfaces in different ways, leading to heterogeneous distributions of urban green spaces (Wheeler, 2015). Using spatial metrics, Debbage et al. (2017) find that urban forms of major US metropolitan cities differ significantly in terms of the contiguity of impervious surfaces. Even though sprawl driven by low-density residential suburbs has generally decreased among most US metropolitan areas, particular metros continued sprawling development for commercial and industrial uses, further fragmenting their green spaces (Debbage et al. 2017). Nowak & Greenfield (2012) analyze the land-cover composition (trees/shrub, grass, agricultural land, built-up surface, water) of 20 major U.S. cities in 2005 and 2009, finding that cities have very different surface layouts with a wide range of variations in vegetation quantities. As more and more cities seek ways to promote sustainable urban development, the quantitative modelling of the spatiotemporal configuration of UGSs is critical for the development of effective greening strategies and judicious land development.

Using time-series satellite images from 1975 to 2015, this study quantitatively characterizes the long-term spatiotemporal changes in urban green spaces in two metropolitan areas – Columbus (OH) and Atlanta (GA). Metro Atlanta is the tenth largest metropolitan area in the U.S., but the city has the highest tree/shrub cover (53.9%) among major US cities (Nowak & Greenfield, 2012). Metro Columbus, ranking 33rd in the nation, is one of the fast growing regions in the U.S., with its suburbs having expanded quickly during the last few decades. Their changing patterns of UGSs are compared to identify similar and divergent trajectories in terms of green space management. The metropolitan scale represents the functional boundary of socioeconomic activities where housing-job-shopping locations are enclosed. Therefore, the long-term impacts of urban developments on UGSs can be best understood at this scale.

We develop the necessary data from 1975 to 2015 using Landsat (4, 5, 7 and 8) satellite multispectral images. To measure the amount and quality of UGSs and other land cover features, we use a set of spectral indices derived from Landsat images: (i) vegetation: NDVI, SAVI, DVI, EVI; (ii) impervious surfaces: NDSI, MNDSI; (iii) buildings/built-up area: NDBI, IBI, VIBI, BCI, NBUI, BUI; (iv) soil: NDSI, RNDI, BI, NDBI; (v) water bodies: NDWI, MNDWI.

These indices represent the levels/intensity of greenness (e.g. trees, shrub, short vegetation, and their health), imperviousness, built-up areas, bare soil, and water, all measured at 30m grid cells (Li et al., 2017). We collect this intensity information per cell for each year and the resulting multi-year database is used to carry:

- (1) Gradient analyses of green spaces and other land covers changes over time and space;
- (2) Clustering analyses, where pixels of similar/close values are regrouped into larger patches;
- (3) Landscape metrics analyses, using area, shape, edge, contiguity, and interspersed metrics;
- (4) Green-space accessibility analyses by interfacing Census of Population data for 1980, 1990, 2000, and 2010, with existing green infrastructure.

The results will highlight the spatial changes in green spaces over time and their substitutions with other land covers in both metro areas, as well as changes in their accessibility and exposure. Similarities and differences will be linked to the histories and policies of Columbus and Atlanta, providing insights for green infrastructure planning.

SPATIAL VARIATIONS IN FLOOD RISK ASSESSMENTS: A COMPARISON OF ANALYTICAL APPROACHES

Abstract ID: 956

Individual Paper Submission

LORENTE, Paula [Texas A&M University] plorente@tamu.edu, presenting author

Empirical evaluations of direct observations of flood damages are often used to identify factors that influence household vulnerability to floods. The National Flood Insurance Program (NFIP) provides the most complete information available today on flood-related damages in the United States. Risk and planning researchers who rely on actual flood damage records to guide development, insurance and disaster mitigation decisions typically conduct observational studies of flood insurance claims. Given limitations with data quality or availability, such studies are often forced to make assumptions about the representativeness of available records for a given area of interest (e.g., zip code, county, etc.) in the hopes that the sample is sufficiently representative of the level of risk experienced by all structures in that geography. Flood damage researchers recognize that this methodological limitation may lead to biased results and have called for increasing the granularity of flood damage data for flood risk studies. However, it is yet unknown the impacts of this limitation on the accuracy of flood risk assessments. This paper reports on two different approaches to assess and compare the spatial distribution of flood risk in 540 residential neighborhoods in Harris County, Texas after a major flood disaster event. The comparisons between analytical approaches are made in terms of operational results, and respective advantages and shortcomings with respect to local planning and insurance decision making. Flood insurance data from the NFIP are used for both analyses. The first approach, following the commonly used approach of observation-based studies, summarizes total flood insurance claim payments of residential property damages for each geography of interest, in this case, neighborhoods. The second and less well-known approach uses flood insurance policy and claim information to derive direct measures of flood risk for each neighborhood. Results from both approaches are used to rank and map neighborhoods by levels of risk. Neighborhood and city-wide descriptions of flood risk are then compared using descriptive analyses and visual mapping methods. Each analytical approach provides a different view of neighborhood flood risk with distinct spatial variations across the entire urban landscape. This second approach is considered a more promising and accurate method because it restricts the empirical analysis of flood risk to only those cases with full information concerning damage or absence of damage. Findings from this work suggest that the selection of different flood risk assessment approaches can thereby potentially affect important community disaster decisions, mitigation investments and resilience outcomes.

IMPACT ASSESSMENT OF THE FEDERAL NATURAL AND CULTURAL RESOURCES (NCR) RECOVERY SUPPORT FUNCTION (RSF)

Abstract ID: 962

Individual Paper Submission

CHANDRASEKHAR, Divya [University of Utah] D.Chandrasekhar@utah.edu, presenting author
 RUMORE, Danya [University of Utah] danya.rumore@law.utah.edu, co-author
 PROFFITT, David [University of Utah] david.proffitt@utah.edu, co-author
 SIDDIQ, Fariba [University of Utah] faribasiddiq@gmail.com, co-author

The management and stewardship of the Nation's lands, waters, and public trust resources requires skillful public service supported by sound science based in experience (Driscoll et al, 2012). Thoughtful impact assessments of current public policy programs can provide this support. In 2011, the Federal Emergency Management Agency (FEMA) released the National Disaster Recovery Framework (NDRF) which provides technical support in the form of Recovery Support Functions (RSFs) to local communities affected by disasters (National Disaster Recovery Framework, 2016). This includes the Natural and Cultural Resources (NCR) Recovery Support Function (RSF) which is coordinated by the Department of Interior (DOI) and aims to "preserve, protect, and restore the affected community's natural and cultural resources and historic properties in a way that is inclusive, sustainable, and resilient" (NDRF, 2016, p.32).

Since the program's inception, the DOI's Office of Environmental Policy and Compliance (OEPC) has helped provide technical assistance to help affected states, tribes, and local communities recover natural and cultural resources impacted by 2011 wildfires in TX, 2012 Hurricane Isaac in LA, 2013 floods in CO, 2014 floods in NM Santa Clara Pueblo, and the 2014 mudslides in WA. There has however, been no formal assessment of the effectiveness of the program in promoting effective recovery and local resilience to future disasters, which makes it difficult to correct inefficiencies in the program and improve its effectiveness, or to learn from its experiences to improve other recovery policy programs.

In this study, we use key informant interviews and surveys of NCR field coordinators, state and local officials in the case studies described above to identify the extent to which the NCR RSF program has facilitate local recovery and resilience. We report on findings on the influence of NCR RSF activities on long-range thinking, networking and coordination, use of creative sources of funding, improved planning culture and capacity, and in meeting local needs in target communities. The results of the study can help the DOI, OEPC and its federal and non-federal partners to better understand the impact and success of NCR RSF recovery efforts led by the DOI and FEMA and provide valuable case studies to inform planning and improve the performance of future disaster recovery operations under the NCR RSF and other allied efforts at multiple scales. This study is funded by the National Park Service and the University of Utah.

JUSTICE BURNING: INCINERATORS AND THE LANDSCAPE OF ENVIRONMENTAL JUSTICE IN THE U.S.

Abstract ID: 974

Individual Paper Submission

ROLHEISER, Lyndsey [Harvard University] lyndseyrol@gmail.com, presenting author

POLLANS, Lily [Hunter College, City University of New York] lily.pollans@hunter.cuny.edu, co-author

Environmental justice (EJ) solidified as a concept and a movement with the observation that hazardous wastes were most often stored or treated in communities of color that had little political power.^[i] Since that time solid waste management has remained a flashpoint for EJ study and political action. Throughout the 1980s, waste-to-energy (WTE) incinerators were proposed across the United States to solve local disposal crises as old municipal landfills closed. Most of these proposed incinerators were never built as a result of public opposition, some of which was explicitly part of the environmental justice movement. Incineration has remained highly controversial in the United States, but there have been few recent studies of the spatial landscape of incinerators that are still operational.

This is problematic because incinerators with advanced pollution control have recently surfaced again as a potential source of renewable energy as well as a long-term solution for solid waste management, particularly as recycling markets have destabilized.^[ii] Despite renewed interest, critics charge that incineration conflicts with material reuse and recycling, and will always result in toxic pollution in some form. In addition, the history of environmental injustice suggests that the impacts of waste management infrastructure in general, and incinerators in particular, are never evenly distributed.^[iii]

This research seeks to update our spatialized understanding of incineration, given the changes in the landscape over the last several decades. Using a comprehensive, longitudinal data set of incinerator locations over three decades, this project will investigate whether local demographic characteristics have predicted facility commissioning and closure in the years since the rise of WTE in the 1980s. In other words, are the landscapes of injustice the same as they were thirty years ago when EJ research was just beginning?

Following the methodological approach of Laurian and Funderberg,^[iv] in which they examined incinerator plant openings in France, initial descriptive regressions will test associations between planned incinerator plants and actual plant openings, and the socio-economic characteristics of surrounding neighborhoods. Building on Laurian and Funderberg, we will also include plant closure and plant planning, thus examining both the politics of siting, and the politics of plant maintenance over time.

Our initial hypothesis, grounded in the classic theory and previous findings of the EJ literature, is that incinerator plants were initially targeted towards communities with lower incomes and higher non-white minority populations. Further—and the anticipated key contribution of this study—we expect to find that plants are most likely to have been closed in communities with higher incomes and lower non-white minority populations, or places that have experienced demographic change.

RACE, PLACE AND RESILIENCE IN NORTH CAROLINA'S POST-DISASTER BUYOUTS PROGRAM

Abstract ID: 992

Individual Paper Submission

MARTIN, Amanda [UNC-Chapel Hill] awm@live.unc.edu, presenting author

Planners recommend post-disaster buyouts to reduce the vulnerability of neighborhoods located in risky areas. Buyouts funded by the federal Hazard Mitigation Grant Program (HMGP) remove development from harm's way, and the land is converted into open space in perpetuity. However, some advocates and critical scholars decry post-disaster buyouts or other post-disaster land use mitigation strategies as veiled means of dismantling low-income communities of color. There is scant research on whether buyouts disproportionately occur in marginalized populations, intentionally or unintentionally. In addition, we may be concerned about disproportionate buyouts in marginalized communities because buyouts can have positive and negative community development impacts. These impacts, from the liquidation of homeowners' real property assets to the creation of recreational amenities or derelict vacant lots, are poorly documented and therefore also not well understood. This research project uses empirical data to build a better understanding of the kinds of neighborhoods where buyouts occur and the changes that those neighborhoods, and nearby neighborhoods, experience after buyouts.

To test the hypothesis that the incidence and impact of buyouts relate to social inequality, this research examines HMGP buyouts of 4,600 properties in North Carolina following flood-related disaster declarations from 1996 to 2010. There are two primary research questions: 1) What are the sociodemographic characteristics of neighborhoods that had the greatest buyout participation? 2) What are the neighborhood-level changes in sociodemographic characteristics associated with neighborhoods where buyouts occur and neighborhoods near buyouts where spillover effects may occur?

To answer these questions, I use an administrative dataset from North Carolina Emergency Management and tract-level ACS and Census data. The first, cross-sectional question uses ordinary least squares regression to measure the association between buyouts and neighborhood sociodemographic characteristics. I hypothesize that a neighborhood's physical vulnerability may bias the results because households of lower socioeconomic status may be more likely to live in vulnerable areas and buyouts, by definition, occur in neighborhoods proven to be vulnerable to floods. To measure the effect of this bias, I run the model with and without floodplain and flood damage data. To answer the second question, I use regression modeling to analyze the association between buyouts and neighborhood change, and I use spatial regression techniques to examine how buyouts are associated with changes in nearby neighborhoods, which may receive an influx of residents after buyouts occur.

The results from this study will contribute to a growing scholarly conversation about buyouts and help bridge the gulf between hazard mitigation planners who promote buyouts and the critical scholars who study their racially disparate outcomes. The results will also point to possibilities for reducing the role of inequalities in the implementation of buyout programs. Buyouts have been implemented with a wide variety of program designs. This flexibility may allow for the use of prioritization, incentives, counseling, and community planning to address disparate impacts and generate additional benefits for participants and their neighbors.

GREEN INFRASTRUCTURE FOR COMMUNITY RESILIENCE: A QUALITATIVE ASSESSMENT OF SCENARIO PLANNING TECHNIQUES

Abstract ID: 997

Individual Paper Submission

HILDE, Thomas [Cleveland State University] t.hilde@csuohio.edu, presenting author

There is increasing recognition that sustainable cities must in turn be resilient to disasters and climate change impacts (e.g., see Cutter, 2008; United Nations, 2015). However, an enduring challenge in local planning is that hazard mitigation and other forms of resilience planning remain fragmented from other community planning efforts (Berke et al., 2015). There is still a limited connection between resilience and green infrastructure (GI) objectives in local planning, despite evidence that ecosystem services provided by urban GI features such as parks, open spaces, riparian areas and greenbelt networks are an essential element of community resilience (Benedict & McMahon, 2012; United Nations, 2015). Thus, a key challenge limiting the use of GI approaches for urban resilience in practice is the lack of an integrated methodology for assessing and comparing GI resilience functions in the context of mainstream community planning. Scenario-based planning—a collaborative process for communities to explore alternative development patterns and learn about their consequences—offers a potential opportunity for drawing these connections more effectively. To follow up on a recent project that explored innovative scenario-based techniques for resilience planning, this paper asks: How effective were the scenario-based approaches for drawing connections between GI and community resilience from the perspective of local planning stakeholders?

This research reports on qualitative feedback regarding the combined use of urbanization scenarios (via the open source Envision Tomorrow geodesign GIS plugin) and flood loss estimation models (via FEMA's Hazus GIS plugin) to assess the resilience of alternative GI land use approaches in Austin, TX. Two underutilized types of scenarios were used: historical counterfactual scenarios to examine past flood events and identify missed opportunities for improving resilience through GI planning approaches; and exploratory scenarios to test how future development might best utilize GI planning approaches to increase resilience to a range of plausible future flood events. While the results of the analysis produced novel information flows, a critical piece of this research is a qualitative understanding of what the information meant to local stakeholders, how it affected their understanding of GI and resilience issues, and what they considered the strengths and weaknesses of the scenario

techniques. For this purpose, semi-structured pre- and post-analysis interviews were conducted with ten local stakeholders in Austin, representing a range of disciplines and sectors related to GI and resilience planning.

Interview findings support the use of historical counterfactual scenarios as a powerful learning device. They also found that the use of integrated scenario techniques and tools were effective for discovering complementary ecosystem benefits (e.g., amenity value, recreation, and flood loss avoidance), identifying important trade-offs between green and grey infrastructure approaches, and understanding the relationship between urban development patterns and GI opportunities. At the same time, interviewees identified areas of potential improvement, such as the inclusion of GI operation and maintenance costs, increased transparency of models, and clearer communication of outputs.

While prior research has investigated the effectiveness of using of scenarios and analytical tools in community planning (e.g. see Bartholomew, 2007; Goodspeed, 2016), qualitative assessment has been limited and has yet to focus on counterfactual and exploratory scenario frameworks. With growing use of scenario planning techniques in practice and the development of new planning support tools, feedback related to their effectiveness is important to consider. In addition, this study is unique in its specific focus on effectively drawing connections between GI and community resilience objectives.

LOCAL CLIMATE ACTION PLANNING AND URBAN GOODS MOVEMENT: ASSESSING STRATEGIES TO REDUCE GREENHOUSE GAS EMISSIONS FROM URBAN FREIGHT TRANSPORTATION

Abstract ID: 1051

Individual Paper Submission

ALEXANDER, Serena [San Jose State University] serena.alexander@sjsu.edu, presenting author
GOETZ , Andrew [University of Denver] andy.goetz@du.edu, co-author

Climate change is one of the most complex challenges of our time requiring planners and their communities to consider the various contributors to the problem and develop effective solutions. In the absence of meaningful federal action to combat climate change, many U.S. cities have developed Climate Action Plans (CAPs) to mitigate greenhouse gas (GHG) emissions from different sectors, such as energy and transportation. Within the transportation sector, an important topic that has not received enough attention is the growing contribution of freight transport to GHG emissions. This is especially problematic in urban areas, where goods movement has become more difficult due to increased urbanization, the critical role of cities in global supply chains, increased freight demand from urban businesses and residences, and changing land use that favors higher-density developments. While contributing to many sustainability goals, higher-density smart growth development has posed significant challenges for more efficient and cleaner transport of freight. This study discusses the common shortcomings of local CAPs relevant to freight GHG emissions reductions, and identifies, evaluates and

recommends the promising GHG emission reduction strategies for urban goods movement. The research process included a review of the literature on innovative strategies to reduce freight emissions and enhance efficiency, document analysis of 32 local CAPs from across the United States that have reached the implementation stage as well as freight plans of the same cities or related metropolitan areas to understand potential linkages between the two types of plans. Findings indicate that local CAPs and freight plans are not linked. Most local CAPs rely on policy measures related to public transportation, walking, cycling and city fleet to reduce transportation emissions and ignore opportunities to reduce freight GHG emissions. Although freight plans consider strategies to reduce GHGs and other environmental impacts from urban good movement, these plans do not consider opportunities for coordinated action with local CAPs. This can hinder the success of GHG mitigation strategies and potentially create conflicts between the goals or outcomes of these two types of plans. Nevertheless, the review of the literature, the local CAPs and freight plans offer some innovative strategies to tackle freight GHG emissions. We used illustrative case studies to highlight innovative freight emissions reduction strategies, and the cost-effectiveness and/or co-benefits of these strategies. This research is relevant to planning scholarship, practice and education as it identifies gaps in our climate action planning practices and offers strategies to further reduce GHGs from the transportation sector.

PLANNING FOR COST-EFFECTIVE MATERIAL AND WASTE MANAGEMENT

Abstract ID: 1060

Individual Paper Submission

ZHENG, Junjun [University of Illinois at Chicago] j.j.zheng2012@gmail.com, presenting author
AI, Ning [University of Illinois at Chicago] ain@uic.edu, primary author

Having material and waste management (MWM) as one of the largest municipal budget items (Daniels, 2014), planners are often faced with the challenges of achieving better MWM performance in a cost-effective manner. Existing studies have shown controversies in effective MWM in relation to public expenditure. MWM expenditure was found positively correlated with higher recycling rates (Sidique, Joshi & Lupi, 2010). It is a concern that spending less on MWM leads to inadequate services (e. g., reduced service frequency and recycling programs) (McCullough, 2017). In contrast, other studies have argued that a budget cut may actually foster a regime shift (e. g., efficient route design for waste collection or privatization) when environmental and economic goals can be mutually effective (Ai and Grande, 2012). In addition, regional heterogeneities, including economic of scale, political and financial resources, citizen awareness, and economic structure, can all influence MWM performance (Ai and Leigh, 2017; Bruce, Asha, and Ng 2016; Sidique, Joshi & Lupi, 2010).

While most existing studies build upon anecdotal case studies or theoretical discussions, this study developed a multi-region and multi-year study that connects the local government expenditure with MWM performance. The Minnesota SCORE reports, which publish county-level MWM statistics (i.e., waste generation, recycling, recovery, expenditures, and enacted policies) from 1997 to 2013, provide a critical opportunity for implementing

our proposed research. This study employed the Log-mean Divisia Index (LMDI) method for a decomposition analysis that explains the changes in waste recycling rates (measured for the effectiveness of MWM) over time. Specifically, three factors were included in the decomposition analysis: recycling program efficiency (i.e., per-ton MWM recycling expenditure), public MWM spending (i.e., per-capita MWM expenditure), and waste generation (i.e. per-capita waste generated). To capture regional heterogeneities, this decomposition analysis differentiated counties within metropolitan areas from those outside. Various metrics of MWM performance are developed and evaluated for planning and policy discussions.

Initial results revealed that annual waste generation volume generally increased along with population growth in Minnesota from 1997 to 2013, although there were some fluctuations. Per-ton recycling expenditure slightly decreased over time, which suggests a general trend of increasing cost effectiveness. Notably, MWM expenditure increased from 1997 to 2001 while waste diversion rates decreased. The decomposition analysis identified recycling program inefficiency and increasing waste generation rate as the main driving forces. In addition, this study found that MWM performance in non-metropolitan areas was more sensitive to macro-economic forces compared to that in metropolitan counties, which is likely associated with various population densities and economies of scale. During economic recession years (2001-03 and 2007-09), the recycling program efficiency improved in metropolitan counties, despite significant decreases in the MWM expenditure. In non-metropolitan counties, although the MWM expenditure remained at the same level, an overall decline in MWM performance was found to be related to decreases in recycling program efficiency. To reveal specific planning implications, this study also explored the effects of local economic structure, demographic characteristics, consumption pattern, MWM infrastructure availability, and evolving policies on MWM program performance. The findings from this study will provide bench-marking information and critical references for sustainable MWM plan-making.

INTEGRATING CLIMATE SCIENCE WITH LOCAL KNOWLEDGE FOR ADAPTATION PLANNING IN HAWAI‘I

Abstract ID: 1075

Individual Paper Submission

SPRIANDELLI, Daniele [University of Hawaii] danieles@hawaii.edu, presenting author

Like many low-lying coastal regions of the world, Hawai‘i is vulnerable to the impacts of present and future hazards associated with climate change. The island of Kauai is especially vulnerable due to a combination of high hazard exposure, high sensitivity of coastal infrastructures, coastal ecosystems, its geographic isolation, and dependence on imported goods. In early 2018, the County of Kauai adopted their 2035 comprehensive plan, which explicitly calls for integrating climate change risks into future land use, development, and infrastructure planning through 2035. Following the adoption of the 2035 General Plan, the County is updating four community plans in West Kauai.

There is growing acceptance that assessment of risks and identification of adaptation responses should take place at the community level, with a process closely involving local stakeholders (van Aalst, Cannon, and Burton 2008; Berke and Lyles 2013; Moser and Pike 2015). Detailed assessments require a combination of the scientific understanding of hazard exposures and local knowledge of conditions for a more nuanced understanding of risks (Kettle et al. 2014; Spirandelli et al. 2016). Integrating scientific and local knowledge is expected to enhance the risk management approach and adaptation process. Here we report on efforts to design and perform a community-based vulnerability assessment across the four West Kauai communities with the objective of integrating climate change risks and adaptation strategies into the comprehensive plan. We hypothesize that integrating local knowledge with scientific knowledge enhances stakeholder understanding and perceptions of climate risks, increases the usability of climate science information, and increases the salience and credibility of the best available science on climate change risks.

We test these hypotheses with in-depth stakeholder interviews and an assessment, a community-based decision support tool, and a post-evaluation survey in West Kauai. For this presentation, we will report on the results from twenty-five semi-structured interviews with community members, local, state and federal managers responsible for infrastructure, facilities and natural resources in West Kauai. Interview questions address how climate risks are framed, how adaptation options are discussed, and how to deal with scientific uncertainty. Preliminary results suggest there is some convergence on the understanding of climate hazard exposures particularly to sea level rise in low lying areas. We find stories of historical land use practices help explain projected exposure maps of future flooding and erosion. We will discuss the relevance and insights on the meaning and practicalities of knowledge co-production and interactions at the climate science-practice interface (Moser and Pike 2015).

EXPLORING THE FULL SPECTRUM OF SOCIAL PROTECTION ACTORS/PROVIDERS AT PLAY AFTER AN EXTREME WEATHER EVENT—THE CASE OF TROPICAL STORM ERIKA IN DOMINICA

Abstract ID: 1084

Individual Paper Submission

LAMBERT, Esther [University of Toronto] e.lambert@mail.utoronto.ca, presenting author

This paper investigates the wide range of non-state and informal social protection actors involved in recovery after an extreme weather event, something that is largely absent from the climate change adaptation (CCA)/disaster risk reduction (DRR)/social protection (SP) integration literature. Although the usefulness of integrating the fields of SP, CCA and DRR has been embraced as conceptually sound, more work is needed to better assess the impact of SP programmes and socially-conscious climate disaster programmes on livelihood resilience (Johnson, Bansha Dulal, Prowse, Krishnamurthy, & Mitchell, 2013; Siddiqi, 2011). More specifically, the role of informal SP systems or networks and support systems amongst family and friends has been largely

overlooked within the SP/CCA/DRR discourse (Johnson et al., 2013). To begin this conversation, however, we need to rethink our categories for social protection providers, which are currently referred to as formal, semi-formal or informal (Getu & Devereux, 2013). This paper argues that they are too general and do not reflect the wide range of social protection arrangements presented in varying contexts. They therefore stifle our ability to consider the wide range of current and potential actors involved in social protection interventions, and their role in ensuring livelihood resilience.

Most of the scholarly work on the role of SP programmes in the context of climate shocks are centered around formal or state SP actors and heavily focused on rural communities in South Asia and Sub-Saharan Africa (Browne, 2014, p. 4), leaving much room for investigation into Caribbean Small Island Developing States (SIDS) like Dominica, whose residents suffered devastating impacts from Tropical Storm Erika in 2015. This paper identifies a wide range of state as well as non-state and informal social protection actors at work for a sample of 191 households in 4 Dominican communities severely impacted. The study reveals a much wider range of social protection providers, to include a number of different non-state and informal sub-categories currently overlooked in the CCA/DRR/SP integration discourse. The level of involvement exercised by a given provider depended on such factors as extent of damage experienced by the community, political influence, and extent of community spirit. Effective, longterm recovery depends on a thoughtful coordination amongst social protection providers (pre, during, post storm), in order to avoid duplication of efforts, and, on a community's ability to give sufficient support to providers that may play a crucial role in rebuilding.

A multi-method case study research approach was used to investigate the range of state, non-state and informal social protection actors at play in Dominica after Tropical Storm Erika in August of 2015. Yin (2003) offers a thorough elaboration on case study research as a nonlaboratory social science methodology. My research is a direct response to the need for more case studies that can be applied to the real world and lead to practical solutions (Corcoran, Walker, & Wals, 2004, p. 7). This research is exploratory and analytical. With the help of research assistants (community workers) sourced through local contacts at the local government level, the researcher administered a survey to approximately 191 heads of households in 4 communities. Afterwards, approximately 20-25 in-depth household interviews were held with heads of households from all communities. Other key informant semi-structured interviews (approximately 30) were held with national and local government officials, representatives from community organizations, non-governmental organizations, religious organizations and other community groups.

This research is a contribution to the SP/CCA/DRR integration literature, which is currently focused on formal social protection provider arrangements in non-SIDS, rural environments. This work will be useful to SIDS' governments, nonprofits, development organizations and donor organizations working to build the adaptive capacity of vulnerable communities to the impacts of climate events.

PLANNING FOR EXTREME HEAT EVENTS: BUILDING A DECISION SUPPORT FRAMEWORK FOR THE CITY OF CHICAGO

Abstract ID: 1102

Individual Paper Submission

CHAKRABORTY, Arnab [University of Illinois at Urbana-Champaign] arnab@illinois.edu, presenting author
WILSON, Bev [University of Illinois at Urbana-Champaign], co-author

Extreme heat events are an important and often overlooked consequence of global climate change that warrant more attention from urban planners (Habeeb et al., 2015; Oke, 2006). The impact of such events on human health in urban areas is likely to worsen in the future due to ongoing patterns of urbanization and the potential for the urban heat island effect. Further, in the U.S., aging population and segregated residential patterns elevate the risks of disproportionately affecting vulnerable populations and communities.

While responses to heat events, like other extreme events, have historically been a public health and emergency management concern, planning's role in creating more resilient communities is increasingly acknowledged. These include regional climate action planning and greater investment in green infrastructure, to policies that target building design and human behavior to reduce energy consumption and heat loss. To a lesser degree, planning role in increasing housing choices or, conversely, concentrating vulnerability is also recognized. However, frameworks that can assist planners understand impacts of planning decisions on heat exposure and vulnerability are limited (Wilson, 2017).

In this paper, we critically reflect on our efforts in building such a framework for the city of Chicago. A few years ago, we developed a tool for mapping exposure and vulnerability to extreme heat in Chicago, as well as an analysis of how these patterns have changed over the last few decades and are expected to change in the next few decades (Wilson and Chakraborty, 2017). Following this work, we joined a team that includes two technology companies, a utility provider, a federal agency, and three departments in the city of Chicago to explore the development and deployment of a tool that can be used by a variety of users to analyze trends and formulate responses. Focusing on building long term resiliency, our specific efforts have identified and mapped some of the key datasets on heat exposure and vulnerability in the region. Using the existing literature, we also capture the relationship between the built environment and heat impacts at building and neighborhood scales. For the next step, we aim to understand how planning interventions affect this relationship. We also aim to characterize the existing understanding of these relationships among planners, and the role this plays in a variety of planning decisions. Our findings thus far suggest that, despite the presence of multiple heat mitigating policies in place, little systematic analysis is done in understanding the relationship between planning decisions and their heat impacts, or in reducing long term regional heat exposure and vulnerability. We hope that our work will advance planners' knowledge of heat impact and improve outcomes.

INTEGRATING HYPER-LOCAL AIR QUALITY DATA INTO PLANNING FOR NEW SCHOOLS

Abstract ID: 1121

KINZER, Kirsten [UNC Wilmington] kinzerk@uncw.edu, presenting author

Public health researchers have documented the relationship between air pollution and childhood asthma (McConnell et al 2010) as well as absenteeism and test scores (Mohai et al 2011) but local air quality is rarely a consideration in planning for new school locations. Although the technology to measure hyper-local air quality has advanced dramatically in recent years, this technology is still out of reach for many planning departments. This paper presents a more accessible method for integrating air quality data into land use decision-making using personal air quality trackers. It tests the hypothesis that siting elementary schools within residential neighborhoods will reduce children's exposure to air pollution in comparison to schools located on major roads. The public elementary schools in Wilmington, North Carolina are the test case for this study. The findings of this paper have implications for planners in areas where population growth necessitates new school construction. The research method the paper utilizes is experimental and will also be of interest to planners concerned with air pollution in relation to land use planning broadly.

In this paper, I investigate the implications of siting Wilmington's elementary schools next to major arterial and neighborhood collector streets on nitrogen dioxide, volatile organic compounds, coarse and fine particulate matter levels, and the overall air quality index rating. Transportation access was a central factor in Wilmington's elementary schools siting decisions but alternative ideas for school siting date back to Clarence Perry's neighborhood unit (1929). The neighborhood unit diagram features "only neighborhood institutions" in the center of the neighborhood, such as an elementary school. I compare air quality at the existing Wilmington elementary schools to air quality at matched-pair alternative sites that follow Perry's recommendation to locate schools in the center of neighborhoods, on low-traffic residential streets. I also collected air quality data at these alternate sites. Air pollution levels at the actual and alternate school sites are compared through a paired-sample t test.

Quantifying the air quality differences between alternate school sites generally requires a partnership with a research institution but personal air quality trackers have created a new option for site comparisons. For example, researchers in Austin, Texas recently created a hyper-local air pollution map using Google Street View cars equipped with sensors that collected data over the course of a year (Apte et al 2017). In theory, this map could be used for land use planning although only by planners in Austin. Researchers have undertaken similar efforts in London and San Francisco but planners in smaller communities are likely to have a significant wait before they have access to "big data" on local air quality. Personal air quality trackers offer another route to integrating hyper-local air pollution data into land use decisions by comparing site level data, rather than extracting information on individual sites from a city-wide data set or map.

CONCEPTUALIZING ACTION EARLY IN THE COLLABORATIVE PROCESS: DRIVING FORCES THAT BUILD CAPACITY FOR COLLABORATION IMPLEMENTATION

Abstract ID: 1139

Individual Paper Submission

JONES, Shanice [Florida State University] smj15e@my.fsu.edu, presenting author

BUTLER, William [Florida State University] wbutler@fsu.edu, co-author

BROWER, Ralph [Florida State University] rbrower@fsu.edu, co-author

Over the last several decades, collaborative planning has grown in popularity and practice within environmental and natural resource management. Collaborative governance is well suited for addressing complex environmental issues that cross geographical and political boundaries, such as loss of biodiversity and species habitat (Koontz & Newig, 2014). While many collaboratives, groups that include multisectoral actors with different interests and positions, achieve innovative solutions they also experience challenges moving the plans into action (Innes & Booher, 2010).

The barriers to collaborating through implementation within public governance include legal and regulatory rules of authority and accountability, organizational norms and procedures, as well as professional cultures (Margerum, 2011; Butler et al. 2015). In environmental and natural resource management, these challenges surrounding the implementation of collaborative governance are magnified at the landscape scale: particularly as authority and accountability overlaps private land owners and public management agencies (Butler et al. 2015).

In this paper we explore how a collaborative, operating at a landscape scale can navigate these tensions and support the implementation of conservation across multiple ownership and management boundaries. This research study asks how and to what extent the dynamics in the collaborative process shape the implementation of conservation efforts on public lands. We identify and analyze the presence and absence of elements effective in the collaborative process and design and then consider the extent to which these elements, may influence collaborative implementation and potential outcomes.

To examine these dynamics, we utilize a case study, the Landscape Conservation Cooperative Network (LCC). The LCC seeks to manage the nation's natural and cultural resources through coordinated conservation, collaborating across boundaries at the landscape scale. Objectively, each of the voluntary actors participating in the network contribute toward developing the shared vision for the collaborative and then apply the common understanding along with shared resources to carry out on the ground implementation of its goals and objectives. Using a single-case the Gulf Coast Plains and Ozarks (GCPO) LCC, one of twenty- two individual LCCs in the LCC Network, we explore how the collaborative process navigates the tensions of collaborative implementation.

The case study provides a rich understanding of some issues influencing collaboration through implementation surrounding environmental and natural resources. The LCC serves as a bridge between science and management through the network design and collaborative process, which depend on stakeholder's participation in implementation. The study captured the actor's perspectives surrounding the shift from planning into action, decision making, and behavior which indicate a complexity of factors.

The findings highlight how easily actors become disconnected with the reality of collaboration that they overlook the critical elements leading toward implementation, specifically the roles they already play. We found that the scale used in collaborating has the potential to influence implementation. Based on the case, we provide recommendations for considering the roles and actions that can progress implementation earlier in the process. This research contributes to further understanding the link between collaborative processes and desired outcomes, by deepening our understanding of how collaborative implementation unfolds at the landscape scale in environmental and natural resource management.

ADVANCING LEARNING AND USABLE KNOWLEDGE IN TRANSDISCIPLINARY LANDSCAPE DESIGN AND PLANNING FOR SUSTAINABLE LAND USE

Abstract ID: 1144

Individual Paper Submission

SLOTTERBACK, Carissa [University of Minnesota] schiv005@umn.edu, presenting author

SAMES, Amanda [University of Minnesota] same0057@umn.edu, co-author

RUNCK, Bryan [University of Minnesota] runck014@umn.edu, co-author

REICHENBACH, Mike [University of Minnesota] reich027@umn.edu, co-author

JORDAN, Nick [University of Minnesota] jorda020@umn.edu, co-author

Sustainable land use requires planning and action at broad spatial scales to align with biophysical and social patterns and processes. At this landscape scale, sustainable land use planning and design initiatives share certain broad goals and commitments, including land-use change to enhance landscape multifunctionality (i.e., the ability of a landscape to produce multiple goods and services for people), networked governance and adaptive management, and deliberation of normative questions about the nature and purposes of landscapes (e.g. Sayer and Cassman 2013).

Transdisciplinary landscape design and planning (TLDP) can be used to advance these goals by engaging a wide range of societal sectors and knowledge sources in collaborative learning and decision making (Nassauer and Opdam 2008). TLDP builds a shared, systemic understanding of the landscape to produce landscape-scale plans that are iterative and adaptive. Further, TLDP broadens the set of interests and issues considered in the planning and design process, working toward enhanced recognition of shared interests and the nature of problems.

The paper integrates this basic conception of TLDP, which draws from multiple disciplinary contexts, relative to the theories and practical guidance offered by urban and environmental planners' on collaboration and decision making. In particular, the paper hones in on conceptions of knowledge in design and planning processes. It highlights how the well-established planning approaches of collaboration and decision support technologies can integrate knowledge from multiple sources and disciplines, including from participants themselves, as well as advance learning through iteration and interaction (e.g. Cutts et al. 2011, Hayek et al. 2016).

The paper adds further insight on knowledge and learning in design and planning processes by engaging with the Cash et al. (2003) knowledge systems for sustainable development framework. This framework, which serves as the basis for the paper's empirical analysis, identifies three essential attributes of knowledge systems that can be used to advance sustainability. They include: 1) credibility, the empirical adequacy of knowledge; 2) salience, the relevance of knowledge to the needs of decision makers; and 3) legitimacy, the degree to which knowledge is respectful of stakeholders' values/beliefs, unbiased, and fair in addressing opposing views.

The paper's analysis utilizes credibility, salience, and legitimacy framework to assess the outcomes of a technology-supported collaborative stakeholder process, engaging experts from multiple disciplines and communities) focused on environmental and agricultural issues in rural Minnesota. The paper shares the results of an already-completed content analysis of pre- and post-process stakeholder interviews and focus groups, to reveal the extent to which the process, the decision support technology used in the process, and information provided by experts and stakeholders contributed to the creation of a knowledge system that was salient, credible, and legitimate.

The findings highlight the relevance of the salience, credibility, and legitimacy framework in planners' analyses of collaborative processes and points to the dynamics of learning and usable knowledge among stakeholders in design and planning processes for sustainable land use.

THEORETICAL FRAMEWORKS IN CLIMATE CHANGE ADAPTATION PLANNING: A COMPARATIVE CASE STUDIES IN COASTAL CITIES OF DEVELOPING COUNTRIES

Abstract ID: 1195

Individual Paper Submission

LE, Tu Dam Ngoc [University at Buffalo, SUNY] tudamngo@buffalo.edu, presenting author

Developing countries are believed to be significantly vulnerable to the impacts of climate change owing to their dependence of livelihoods on climate-sensitive sectors, infrastructure deficits, and limited adaptive capacity. Remarkably, coastal cities in developing countries are increasingly susceptible to the adverse impacts as a result of sea level rise, more intense climate extreme events, and other non-climatic factors. In responding to this global climate issue, numerous coastal cities in developing countries have made significant progress in shaping their climate adaptation plans. Tracking these planning practices is necessary to offer interactive lessons between theory and practice.

The evolution of climate change adaptation is shifted from a single-dimension to an integrative approach and significantly aligns with the theory of vulnerability and resilience. Planning for climate change adaptation, correspondingly, is guided by multiple frameworks categorized as the hazard-based approach, the vulnerability-based approach, and the model of urban resilience. This study seeks to explore the application of theoretical frameworks in climate adaptation planning across coastal cities of developing countries. The study aims to address the research question of how theoretical frameworks affect the formulation of adaptation options.

The study uses the sample of 36 coastal cities across developing countries with 42 sets of adaptation planning, vulnerability assessment, and urban resilience strategy and consists of two stages. The first stage utilizes a multiple regression to examine the impact of theoretical frameworks on the formulation of adaptation options controlling for the publishing year, the planning methodology and the number of stakeholders involving in the planning process. The finding illustrates a significant impact of theoretical frameworks and the planning methodology on the formulation of adaptation options. A comparative case study then follows to explore the ways theoretical frameworks are used to shape different focuses as well as the proposed adaptation strategies across these coastal cities. Although the planning documents propose a wide variety of adaptation actions, the documents guided by a hazard-based approach are more focused on structural and social actions while the ones with an urban resilience framework emphasized more on institutional strategies. Meanwhile, the vulnerability approach guides

the proposed adaptation options toward all three types of measures, which are necessary to treat the physical exposure, the social vulnerability as well as institutional capacity building.

These findings suggest the use of theoretical frameworks in adaptation planning. Specific frameworks might lead to different focuses on proposed adaptation options. Therefore, a city should acknowledge the differentiates between the three models to choose a relevant one or integrate between models in conducting their climate adaptation planning.

A STUDY OF WATER QUALITY INDEX AND RESIDENT PERCEPTION ANALYSIS FOR SUSTAINABLE URBAN STREAM RESTORATION

Abstract ID: 1196

Individual Paper Submission

HONG, Chang-Yu [Portland State University] 503changyu@gmail.com, presenting author

Many researchers who advocate for environmental policies are prone to value the preservation of conventional water resource systems and individual pro-environmental behaviours rather than development (Milfont & Sibley, 2012; and Aberg, et al., 2013). This research explores if individual preferences for the major functions of stream restoration processes correlate water quality variations in an urban watershed of South Korea. This work uses a set of results from an analytical hierarchy process (AHP) model to rank the major stream restoration functions (Podolak, 2012) and compare citizens' preferences (Coeterier, 1996) for 'water quality' improvement during stream restoration based on the water quality index (WQI) and ordinary least square (OLS) regression.

This research will answer the research questions and examine the hypotheses below:

Research Questions

1. Which demographic factors of citizens are associated with comparative recognition (perception) regarding stream restoration?
2. Which comparative recognitions (perceptions) of stream restoration are significantly associated with water quality changes?
3. How differently do individual demographic factors correlate water quality changes among six subwatersheds of the An'Yang Stream watershed?

- H1: Citizens' demographic data may influence their perceptions regarding stream restoration.
- H2: The individual perceptions and awareness of An'Yang Stream restoration may influence the extent of changes in water quality.
- H3: Citizens who live in poor water quality areas highly value water quality improvements from stream restoration.

Data are collected through a survey with participants representing each stakeholder group as well as with scholars in the field of stream restoration. This study finds the correlation between the WQI and individual perceptions regarding stream restoration. Regional context and individual characteristics also influence the demands and awareness of citizens pertaining to stream restoration. My findings highlight the importance of understanding residents' perceptions and demographic information, including education, marriage status, gender, and residence period in different sub-watersheds. The largest change (28.29) in the WQI score of one subwatershed was correlated with the participants' perception of water quality changes and water pollution (AHP index: 66.8%). Based on the survey results, my research recommends that a human-ecological interdependent and adaptive consultative body is established in each sub-watershed to successfully implement stream restoration projects.

The results reveal that it is necessary for urban planners to consider the interdependence between water quality indicators and citizens' perceptions regarding stream restoration. In this case, the polluted and poor-quality water with a bad odour and unfavourable aesthetics may possibly lead citizens to believe that activities in the waterfront space may be harmful and unsafe. Besides, regional contexts and individual characteristics were significantly associated with the demands and personal awareness of the potential risks of water quality deterioration. The research results can provide useful insights regarding urban stream restoration in understanding how much collaboration occurs between urban planners and local residents and what kinds of the individual perceptions should be included in this emerging scholarship.

SALVESEN, David [University of North Carolina at Chapel Hill] dsalv@email.unc.edu, co-author

Significant urban growth in coastal areas due to growing residential, commercial, and tourist demands has transformed the shape and composition of shorelines. This development relies on a number of factors to remain

viable, including public funding for infrastructure, such as roads or utilities, as well as funding for shoreline protection features to guard against natural hazards (e.g., storm surges, sea level rise).

In this paper, we seek to understand how federal flood insurance and infrastructure subsidies affect the development and placement of coastal protection infrastructure. More specifically, we ask, how does the removal of these subsidies affect the location, extent, and composition of coastal protection infrastructure?

We contextualize our work through the lens of the 1982 U.S. Coastal Barrier Resources Act (CBRA, Public Law 97-348), which aimed to disincentivize risky development in high-hazard areas by removing federal funding for infrastructure and disaster assistance on undeveloped barrier islands (called CBRA units) along the eastern and gulf coasts of the United States.

To understand the impacts of the relatively novel, “subsidy removal” policy approach (Jones 1991), we use a quasi-experimental, pre-post design to assess changes in the composition and location of the coast over time and its relationship to CBRA units. Along with current, GIS shoreline composition data, we use high resolution satellite imagery to digitize historic shoreline data to assess shoreline change in five states (Alabama, Delaware, Florida, North Carolina, and Texas) across multiple time periods, including before (1980) and after (2015) CBRA implementation. Shorelines are classified by CBRA designation (within or outside a CBRA boundary) and land composition (rock, sand, riprap, tidal flat, marsh). Difference-in-difference tests are used to evaluate (1) the change in shoreline composition over time, and (2) locational shoreline change. Our findings illuminate the degree of variation in shoreline change between CBRA units and non-CBRA areas and provide insights into the relationship between the composition of a shoreline, its nearby development pressure, and the impacts of CBRA as a subsidy removal approach to hazard management. We also explore edge effects at CBRA boundaries, which offer further lessons regarding the unintended effects of having abrupt edges to zones of subsidy removal.

Studies examining interactions between the built environment and sensitive coastal resources have emphasized macro-scale system dynamics in coastal regions (Timmerman and White 1997) and micro interactions at the habitat scale (Bulleri and Chapman 2010). While shoreline dynamics are the result of a number of influential, natural and anthropogenic forces, we hypothesize that the differential application of hazard reduction conservation-oriented policies may play a major role. While recent work has discovered substantial human modification of shorelines (i.e., Gittman et al. 2015, 2016), few studies have actually looked at the rates of change to shorelines in light of conservation policy (e.g., CBRA) or development patterns.

ANALYZING TRENDS IN URBAN SUSTAINABILITY AND EQUITY INDICATORS

Abstract ID: 1208

Individual Paper Submission

THOMAS, Ryan [Cornell University] ryan.thomas.rt@gmail.com, presenting author

Indicators have become a common mechanism for decision making and monitoring urban areas (Kitchin, Lauriault, and McArdle, 2015). Scholars have redoubled efforts to understand the complex, evolving relationship between urbanization and environmental sustainability, resulting in new indicators designed to measure how cities impact the environment. Urban areas have meanwhile become important units of environmental policymaking through international diplomatic processes, including the 2016 UN Habitat III conference in Quito, Ecuador. Perhaps the clearest signal of the urbanism's rise in prominence, Sustainable Development Goal 11 (SDG 11) is a standalone goal on cities, charging nations to make cities "inclusive, safe, resilient and sustainable" (United Nations, 2017).

Recognizing SDG 11's focus on inclusivity as an appeal to environmental justice, this paper evaluates the urban sustainability indicators landscape to answer the question: How do urban sustainability indicators operationalize environmental justice? Our aim is to identify qualities of indicators that would allow policymakers to quantitatively measure and track progress towards environmental justice goals.

Three out of the 10 indicators for SDG 11 feature equity provisions motivated by environmental justice – to "ensure" or "provide" access (Indicators 11.1, 11.2, 11.7) to environmental goods and services. Yet, these equity indicators are among the most challenging to track due to the lack of data (Simon et al., 2016). Environmental equity metrics are often used to operationalize environmental justice through the distribution of environmental harms (e.g., exposure to pollutants) and access to environmental benefits (Agyeman & Evans, 2004). SDG 11 focuses on distributional equity, whereas environmental justice scholars suggest approaches that "encourage active community participation, institutionalize public participation, recognize community knowledge, and utilize cross-cultural formats and exchanges to enable the participation of as much diversity as exists in a community" are required to address the root cause of environmental injustice (Schlosberg, 2004). While all environmental indicators are implicitly related to equity, further analysis is often needed to make these connections explicit.

We reviewed 45 indices related to urban environment, sustainability, and environmental justice, including 445 indicators published by governments, civil society organizations, academic institutions, and the private sector. Based on a review of the metadata, we coded each indicator using qualitative methods to group and build patterns along key dimensions including (1) whether the indicator explicitly or implicitly addressed equity, (2) the scale of the unit of analysis, (3) the presence (or absence) of targets and baselines, and (4) whether the indicator conforms to the commonly-used SMART criteria, and (5) how it fits with SDG 11 indicators. The reviewed indicators reflect a broad range of topics related to environmental performance, however five topics - water and sanitation, climate and energy, transportation, waste management, and air quality - are more frequently found in the sample compared to other.

Through initial analysis, we profile the indicators and find that that indicators explicitly aimed at measuring equity tend to have a smaller unit of analysis compared to indicators not explicitly addressing equity. This finding may be related to the fact that most of the indicators addressing equity measured distributional equity. We found few indicators that meet Schlosberg's alternatives quoted above. Many of the indicators are lacking targets and fall short of the SMART criteria. Our conclusions suggest that future work developing environmental justice indicators should focus on establishing realistic targets and spatial disaggregation of indicator data that would enable explicit assessment of distributional equity. Discussion of new spatial analysis technologies offers strategies for achieving these indicator goals.

DOES CONTEXT MATTER IN ENVIRONMENTAL JUSTICE PATTERNS? EVIDENCE ON WAREHOUSING LOCATION FROM FOUR METRO AREAS IN CALIFORNIA

Abstract ID: 1221

Individual Paper Submission

YUAN, Quan [University of Southern California] QUANYUAN@USC.EDU, presenting author

Warehousing activities generate substantial externalities that affect surrounding neighborhoods. An increasing number of protest and lawsuit cases showed that local residents complained about the massive warehousing development in their communities and worked together to fight against it. The gap between real-world conflicts and academic understanding incentivizes more research on the environmental justice problem in warehousing location. The existing research in particular has not provided adequate evidence on the disproportionate distribution of warehouses in different urban contexts, and discussed whether interregional differences would affect the environmental justice patterns. Why is this discussion necessary? To address the environmental justice problem requires regional collaboration. Regions are, however, widely different from each other in terms of geographic, economic, and institutional characteristics. It is important for planners to understand the environmental justice patterns in the contexts of different regions and further develop appropriate strategies in accordance with those characteristics of the regions.

This study tests whether environmental justice problem exists in warehousing location using data for four major metro areas. Multivariate regression models are used to estimate the relationship between warehousing activity intensity and disadvantaged neighborhoods. Although the urban contexts in the four regions vary a lot, the results across models are generally consistent. The results confirm that transport access, industrial connection and economic attributes of a certain zone are closely associated with warehousing distribution in that zone. With all these variables controlled, the models show that warehouses and distribution centers are disproportionately located in minority neighborhoods.

The findings can help better understand the environmental justice problem in warehousing location in different urban contexts. First, the results provide solid evidence on the disproportionate distribution of warehouses in minority neighborhoods. The spatial relationships between warehousing location and minority neighborhoods are consistent across regions despite the vast differences in demographics. Second, the relationship between warehousing location and socioeconomic status is less apparent. In three of the four regions, both medium-income and low-income minority neighborhoods have higher warehousing activity intensities than the reference group, but there is no consistent evidence that low-income minority neighborhoods are different from medium-income ones in terms of warehousing concentration. Third, while all regions are subject to environmental inequity in warehousing location, minority groups are faced with different levels of environmental threats due to various context-based resources and constraints. The abundant undeveloped land in the hinterland of the Los Angeles region provides high-income minority people more options to avoid environmental hazards, while in San Diego region, people who belongs to the same group do not have that many choices due to geographic constraints.

The findings have profound policy implications on the environmental justice problem. Policy makers should always keep an eye on the environmental consequences of warehousing development, even in regions with a relatively low proportion of minority population. Meanwhile, urban contexts matter in evaluating the exposure of different minority groups to warehousing related environmental risks. Geographic constraints, urban structure, and land use legacy could all affect the environmental justice landscape.

CLIMATE POLICY FOR FOLLOWERS: EVALUATING THE SUITABILITY OF ENTREPRENEURIAL CITIES' CLIMATE POLICY MODELS FOR USE IN LATE-MOVER MUNICIPALITIES

Abstract ID: 1226

Individual Paper Submission

WATSON, Siobhan [Columbia University, GSAPP] sw2850@columbia.edu, presenting author

Entrepreneurial states and municipalities go to great lengths to reduce their emissions and prepare for climate change, while states and municipalities without the will and capacity to take on such policies have done much less. This has led to an uneven concentration of expertise and experience with climate-related policymaking (Gore & Robinson 2009). While scholars often extract advice for other cities from climate leaders' experiences, we know little about how climate leaders' models work when implemented by climate followers. If planners wish to understand what kinds of climate change mitigation plans are likely to be effective beyond places that consider themselves local climate policy leaders, it is essential to understand what works when local governments are lured into climate-related policymaking in the absence of a strong local political will to do so. Research on the prevalence of local climate planning supports this need: Outka and Feiock (2012) found that in spite of the attention paid to local climate action in academic studies of the subject, most local governments they surveyed had done nothing or very little with respect to climate change policy.

This study uses municipalities' experiences with climate and energy programs funded by the American Recovery and Reinvestment Act of 2009 (ARRA) to examine the determinants of climate policy success among follower municipalities. Many local governments received ARRA funds directly from the federal government, and were required to spend the money on energy efficiency projects developed locally. Although the grants were accepted voluntarily, the extent of the economic recession at the time put pressure on eligible subnational governments to apply for all available grants (Miller and Blanding 2012), creating a policy case that provides some clues about the behavior of municipalities that are coerced into the climate policy arena.

The study uses a mixed methods approach, employing multivariate regression models to identify factors that tend to predict timely implementation of ARRA programs, and selecting cases for more in-depth qualitative study based on the regression results. Several "typical" cases—municipalities with predicted and actual delays in implementation—provide clues about the problems that may stem from applying entrepreneurial cities' policies to non-entrepreneurial municipalities. "Deviant" cases—municipalities with low expected success but high actual implementation success—provide information about how reluctant adopters of climate policies overcome these challenges.

Entrepreneurial local governments are an important source of new ideas for policymakers at the state and local level beyond the arena of climate and energy policy. When a state or federal mandate or fiscal policy attempts to spread a policy idea beyond the places where it originated, though, it targets places that are less entrepreneurial in the policy area of interest (Shipan & Volden 2012). This study contributes to an understanding of how the

implementation of policy ideas can be made more effective both from the perspective of the local planners charged with implementing them and the state and federal policymakers attempting to spread good ideas effectively.

A METHODOLOGICAL ASSESSMENT OF EXTREME HEAT MORTALITY MODELING AND HEAT VULNERABILITY MAPPING IN ATLANTA, DETROIT, AND PHOENIX

Abstract ID: 1248

Individual Paper Submission

MALLEN, Evan [Georgia Institute of Technology] esmallen@gatech.edu, presenting author
STONE, Brian [Georgia Institute of Technology] stone@gatech.edu, co-author

Extreme temperatures pose a significant risk to human health, and are projected to worsen in a warming climate with increased intensity, duration and frequency of heat waves in the coming decades. Urban residents are at higher risk of heat exposure due to the urban heat island, a phenomenon in which built materials absorb and retain heat from the sun and elevate urban temperatures. To mitigate heat exposure and protect sensitive populations, urban planners are increasingly using heat vulnerability indices (HVIs) to identify high priority areas for intervention and investment. HVIs aggregate vulnerability indicators into an overall score that accounts for heat exposure, population sensitivity, and adaptive capacity factors. Relative HVI scores help identify which areas are at greatest risk of heat-related morbidity and mortality. However, HVIs are highly subjective in their construction. Decisions in the model construction method and vulnerability indicator choice can significantly influence the resulting map. Thus, a slight change in HVI construction method could direct resources into completely different neighborhoods. Furthermore, HVIs are difficult to validate, as estimating heat-related mortality has its own methodological challenges. One method to estimate mortality attributed to heat is using statistical attribution. This model uses regional climate models to simulate air temperatures comprehensively over a city, coupled with a heat exposure-response function to estimate heat-related mortality. But this is often beyond the capabilities of local planning departments due to limitations in funding or technical expertise. It is much easier to obtain remotely sensed surface characteristics and using GIS analysis techniques with which planners are commonly more familiar. Given these constraints, this study seeks to answer: to what extent do established HVI methods accessible to planners correlate with WRF-modeled mortality estimates? Furthermore, what factors, obtained purely from sources easily accessible to the urban planning practitioner, significantly explain these mortality estimates?

Data & Methods

This study compares various HVI construction method outcomes to statistically attributed heat mortality using WRF models of historically high heat waves in Atlanta, Detroit, and Phoenix. Heat vulnerability indicators identified in the literature were collected for each city at the census tract level from sources such as the National Landcover Database and the US Census. HVI accuracy is assessed using bivariate spatial regression to correlate the HVI scores with WRF modeled mortality estimates.

Results

Results indicate that HVI scores do not always track well with mortality estimates, in some cases highlighting completely different neighborhoods within the same city. Bivariate spatial regression between HVI scores and mortality estimates shows an R-square of roughly 0.4. Composite HVI scores may also be more useful to the practitioner if broken down into more policy-relevant components. Mapping exposure and sensitivity separately allows for more targeted responses specific to local context.

Significance

In a warming climate, it is increasingly important for cities to adopt strategic plans to protect our most vulnerable populations from heat-related morbidity and mortality. Cities must begin to monitor local temperatures now as a first step toward creating a resilient urban environment and population. This information can help urban planners and public health officials improve their emergency response plans and communication strategies for heat mitigation in urban areas by specifically targeting short and long-term responses where there is greatest need. A statistically significant correlation between WRF-derived mortality and heat vulnerability indicators equips planners with a useful and accessible tool to protect vulnerable populations in urban areas effectively and efficiently. A targeted approach can guide both greening policies for passive cooling and emergency heat response among sensitive populations. This research utilizes the latest scientific methods to meet contemporary climate change planning needs, and could significantly advance policies and plans to adapt to a changing climate.

IMPACTS OF URBAN LAND USE PLANNING ON ATMOSPHERIC POLLUTION: EMPIRICAL RESEARCH BASED ON FINE-GRAINED DISTRIBUTED AIR POLLUTION SENSOR NETWORKS AND UNMANNED AERIAL VEHICLES

Abstract ID: 1250

Individual Paper Submission

PENG, Zhong-Ren [University of Florida] zpeng@ufl.edu, presenting author

Whether and to what degree optimizing land use layout could improve urban air quality and reduce residents' exposure still lacks theoretical and empirical evidences. This paper focuses on exploring the relationship between urban land use structure and layout and the spatiotemporal distribution of air pollutants, based on distributed air pollution sensor networks and conventional monitoring networks in Dezhou, China, supplemented by Unmanned Aerial Vehicles (UAV) platform monitoring data, land use and transportation data. The Time-series Clustering model is used to depict the fine-grained spatiotemporal distribution of air pollutions in the urban areas, and the Geographically Weighted Land Use Regression (GW-LUR) Model is used to analyze the empirical relationship between land use type and layout and atmospheric pollutant concentration. Then CMAQ and WRF-Urban numerical models are used to simulate the effect of urban ecological corridor and land use adjustment on the

distribution and diffusion of air pollutants under different meteorological conditions. This paper aims to address two key scientific questions: (1) how and to what extent does the urban land use affect the spatiotemporal distribution of urban air pollution? (2) What effect does the land use planning have on the spatiotemporal distribution of atmospheric pollution? The results show that fine-grained data from the air pollution sensor networks reveals important spatiotemporal distribution patterns of air pollutants in the urban areas, that these spatiotemporal distribution patterns are closely related to land use types, density and structures, and that change in land use structures in the urban areas has significant impacts on the spatiotemporal distributions of air pollution in the urban areas. The research results provide a solid foundation and are important for land use planning.

CLIMATE ADAPTATION AND SOCIAL VULNERABILITY IN AUSTIN, TEXAS

Abstract ID: 1256

Individual Paper Submission

ZOLL, Deidre [University of Texas at Austin] deidrezoll@utexas.edu, presenting author

As awareness of climate change increases, U.S. cities are beginning to implement climate adaptation initiatives to reduce population vulnerabilities to climate risk. Adaptation initiatives cover a variety of interventions that range from small-scale green infrastructure solutions like bioswales to major engineering projects like flood walls. As these climate adaptation projects have been deployed, researchers have questioned if these interventions exacerbate or create new forms of environmental inequality (Anguelovski et al., 2016; Muñoz & Tate, 2016; Shi et al., 2016). This paper contributes to that literature with a focus on urban planning responses to increased flooding predictions due to climate change in Austin, Texas. Spatial logistic regression is used to quantitatively describe the relationship between measures of income, race, social vulnerability and the siting of climate adaptation interventions.

Flooding is considered one of the deadliest natural hazards in the U.S., and between 1996-2014, Austin experienced 76 flood events resulting in 10 casualties, 50 injuries, and \$105 million in property damage (City of Austin, 2016). In response to past flood events and future climate change predictions, the city has characterized existing and future projects that could improve flood resilience in the city (City of Austin, 2014). This study uses spatial logistic regression to answer two questions: 1) Are census block groups with greater racial/ethnic and income disparities more likely to be located in floodplains? 2) What is the relationship between measures of income, race, social vulnerability, flood risk, and the probability of a census block group receiving a climate adaptation intervention?

Analysis was completed on two categories of dependent variables; exposure to flood risk and proximity to flood adaptation initiatives. Flood adaptation initiatives capture existing and planned efforts by the city to improve flood resilience and are grouped into three categories: flood buyouts, small-scale green infrastructure, and planned future tree canopy. Four independent demographic variables are used to assess race/ethnicity and

income at the block group level. Nine additional demographic variables compose a social vulnerability index to capture compounding social stressors.

Initial results suggest that there is a statistically significant relationship between the probability of living in a census block group that receives a flood adaptation action and measures of flood risk, income, and race/ethnicity. The probability of receiving small-scale green infrastructure increases with median household income and the concentration of Asian residents. A lower probability of receiving small-scale green infrastructure is associated with higher measures of socioeconomic and education/language vulnerability. In contrast, the probability of receiving flood buyouts rises with increases in the percent of non-white Hispanic residents. The probability of a census block group being a priority for future tree canopy expansion increases as percentages of non-white Hispanic and African American residents increases, along with higher measures of socioeconomic, and education/language vulnerability themes.

Analysis of Austin's planning documents show that flood buyout and tree canopy plans are responding to an evaluation of risk, and in the case of the tree canopy, a desire to address existing environmental justice issues. In contrast, there is no documentation around the goals or intentions of small-scale green infrastructure. This paper suggest that when the City of Austin is intentional about siting climate adaptation initiatives they can do so in a way that is more spatially equitable. However, findings around access to small-scale green infrastructure may provide additional support to concerns that adaptation projects may create "ecological enclaves" that protect more privileged communities (Anguelovski et al., 2016; Shi et al., 2016). These findings contribute to on-going work that seeks to understanding how new urban planning responses to climate change perpetuate or address issues of climate justice.

EXPLORING THE COOLING POTENTIAL OF URBAN AGRICULTURE DURING EXTREME HEAT CONDITIONS

Abstract ID: 1280

Individual Paper Submission

HABEEB, Dana [Indiana University] dana@danahabeeb.com, presenting author

Extreme heat events are responsible for more annual fatalities in the United States than any other form of extreme weather [1]. Urban centers are particularly vulnerable to the threats of excessive heat as most cities are home to large populations of lower income individuals who often lack access to air conditioning or adequate healthcare facilities. Urban populations are also more likely to be exposed to extreme heat due to the urban heat island (UHI) phenomenon. As the global population continues to urbanize, the number of vulnerable individuals will continue to increase making urban heat island mitigation strategies all the more important.

This research explores urban agriculture as an urban heat island mitigation strategy. Though previous work has examined the role of vegetation in mitigating the UHI effect [2], the potential of urban agriculture as a mitigation

strategy is relatively unexplored. Vegetative strategies in regions with sufficient rainfall have been shown to be very effective heat mitigation strategies for combating the UHI effect. While vegetation has been upheld as an effective cooling strategy, the impact of using vegetation as a heat mitigation strategy during periods of extreme heat is unknown. This paper presents the results of a land cover analysis, which investigates the climate effect of urban agriculture on local temperatures by examining how urban agriculture performs during a heat wave. The research is conducted in the city of Atlanta, GA, as Atlanta has one of the fastest growing urban heat islands and has exhibited significant increasing trends in heat waves [3].

This paper is a continuation of previous research where I showed that urban agriculture can reduce nighttime temperatures and outperforms forested land cover in reducing nighttime temperatures at the MSA level. My research shows that urban agriculture sufficiently decreases high nighttime temperatures during hot summer months, which is an important finding from a public health perspective, as night-time temperatures are a better metric for capturing negative health effects from extreme heat than daytime temperatures.

In this research, I conduct a land cover analysis to investigate how the cooling potential of agriculture changes during extreme heat conditions. I use satellite temperature data, land cover data, and urban form metrics to estimate how the percent change in urban agriculture impacts local temperatures. In order to investigate the role of urban agriculture as a heat mitigations strategy, I conduct a land cover analysis during a heat wave and non-heat wave period. I investigate the land cover over the entire Atlanta MSA and explore how temperatures change at a local scale depending on the composition of the local land cover.

This research builds on work currently examining the potential of urban agriculture to effectively revitalize neighborhoods with vacant properties and reclaim brownfield sites in urban areas. When designing heat mitigation strategies, it is important for planners and policy makers to quantify the difference between vegetative approaches in order to understand the tradeoffs they are making climatically, environmentally, and socially as well as understand how these vegetative strategies perform during extreme heat conditions. As such the results of this research can help guide planners when selecting between vegetative UHI mitigation strategies and may further support the burgeoning urban agriculture movement.

TRANSFER OF DEVELOPMENT RIGHTS AND WATER QUALITY TRADING: A COMPARATIVE ASSESSMENT OF GEOGRAPHIES AND BARRIERS

Abstract ID: 1288

Individual Paper Submission

BENDOR, Todd [University of North Carolina] bendor@unc.edu, presenting author

LINKOUS, Evangeline [University of South Florida] elinkous@usf.edu, co-author

VAN MAASAKKERS, Mattijs [Ohio State University] vanmaasakkers.1@osu.edu, co-author

Recent years have seen a ground-swell of bi-partisan support for market-based environmental and land use policies. This excitement is rooted in these policies' theorized potential for achieving goals more efficiently than non-market regulatory approaches. However, the performance of trading programs is uneven, with many exhibiting modest or very low trading activity (Hamstead and BenDor, 2010; Linkous and Chapin, 2014). This is evident across a wide range of geographies and among very different types of trading programs, suggesting the need for comparative research that looks across different trading programs to better understand the factors

promoting, or detracting from, the viability of these resource protection strategies.

This research examines transfer of development rights (TDR) and water quality trading (WQT) programs in the US, seeking joint lessons that can inform the design and implementation of ecosystem trading programs in general, as well as improve our understanding of why these widely adopted policies often have limited implementation and performance. TDR programs allow landowners to sever and sell the right to develop property, creating a market for development rights that provides an alternative or complement to land use regulation. WQT programs include a number of arrangements for redistributing pollution allocations to find efficient ways that polluters can reduce their effluent. TDR and WQT programs demonstrate similarities and differences, the identification and analysis of which may yield insights for understanding the potential and pitfalls for environmental trading programs.

What are the common inhibitors to implementation of TDR and WQT programs? Where and why have these programs overcome barriers to become functional and productive?

While several WQT programs have found frequent use, many experience operational barriers that closely mirror inhibitors endemic to TDR programs (Linkous 2017). Evaluations of TDR programs tend to focus solely on the few successful programs (Pruetz and Standridge 2009), producing little evidence about what sort of TDR transfers are typical, or even if transfers regularly occur (Linkous 2016). Few studies have sought to understand the abundance of TDR programs (including small-scale programs), the extent to which TDR is actually used for environmental protection or other uses, and whether local governments operating TDR programs actually view them as a viable tool for resource protection. Similarly, few studies have sought to understand the extent and abundance of WQT programs, where they tend to be established and/or successful, and where trading actually occurs (as opposed to pilot studies or programs that exist only on paper). Currently, there is little research that attempts to synthesize the lessons for program design, implementation, and performance through comparative analysis of different types of trading programs.

In this paper, we explore the first step in this research project, presenting the most complete database to date on WQT and TDR programs in the United States. We have compiled WQT program information from numerous data sources over the last two years, mapping markets specific to separately traded pollutants, distinctive geographic service areas, and individual trading mechanisms. Drawing on demographic, political, urban, and environmental co-variates, we use logistic regression modeling to better understand the existence and relative operating state of WQT programs. We likewise have compiled TDR program data from literature sources and local government records to paint a geographic and operating picture of programs in North Carolina, Pennsylvania, and Florida, states that each have distinct WQT and TDR policies and program histories. We conclude by discussing upcoming case-study work that will build on this data collection work to qualitatively analyze cross-fertilizations and regulatory learning in areas with TDR and WQT program overlaps.

SHEN, Suwan [University of Hawaii] suwans@hawaii.edu, presenting author

In recent years, many studies have been conducted to assess the vulnerability to climate change and sea level rise in particular. The measure of vulnerability serves as a starting point for the understanding of climate change impacts and the prioritization of vulnerability reduction strategies (O'Brien et al. 2004). Using various social and physical indicators, vulnerability to climate change is usually assessed as a characteristic or state generated by multiple social and environmental process and exacerbated by climate change (Kelly and Adge 2000). Such characteristic or state depends on the actions and perspectives of stakeholders, the rules of decision making, and the underlying knowledge and value systems that drive the decisions (Miller et al. 2010). The perspectives and their relative importance are context-specific, associated with individuals, institutions, organizations, and cultures, and sometimes based on competing values (O'Brien and Wolf 2010). Therefore, literature proposes to take an actor-oriented view and adopt a value-based approach in vulnerability assessment to explicitly acknowledge the value of multiple perspectives, to identify potential conflict and convergence, and to facilitate the adaptation across sectors and scales (Miller et al. 2010; O'Brien and Wolf 2010). However, despite these potential benefits, there have been very few explicit value-based climate change vulnerability assessment that considers both physical risks and stakeholder values (O'Brien and Wolf 2010).

To fill the aforementioned research gap, this study proposes a value-based approach to assess the integrated vulnerability to sea level rise in Tampa Bay region. Acknowledging the vulnerability of sea level rise are linked with multiple dimensions and the significance of these dimensions differ by stakeholders, this study conducted a survey in the study area to explicitly assess the perception of the relative importance of social, economic, and infrastructure vulnerability to sea level rise by different agencies. Planners, city managers, and planning and engineering professionals from municipal planning agencies, county agencies, state and regional environmental protection agencies, department of transportation, and private planning and engineering companies have been asked to rate the importance of different dimensions and indicators on a scale of 1 to 9. The ratings are used 1) to compare the relative importance of infrastructure vulnerability, social vulnerability, and economic vulnerability, 2) to compare the relative importance of different critical infrastructures (i.e. emergency operation center, healthcare facilities, principal transportation facilities, fuel distribution centers, police, and fire department) in the infrastructure vulnerability assessment, 3) to select the most important measures to capture the regional economic vulnerability. Statistical analyses such as Friedman's test and Paired Wilcoxon signed ranks test are conducted to quantify the value compatibility among different agencies.

The analyses find that for the agencies in the case study area, social, economic, and infrastructure vulnerabilities are considered equally important at 95% confidence level. For economic vulnerability indicators, stakeholders value the impacts on employment over the impacts on wages or businesses. For critical infrastructures, agencies consider transportation facilities more important than other emergency facilities. Based on these findings, Analytic Hierarchy Processes (AHP) is then applied to generate an integrated vulnerability index under 1ft, 2ft, and 5ft sea level rise scenarios respectively. The integrated vulnerability index is mapped out at census block group level for the case study area to identify the hotspot for vulnerability reduction.

Although the findings are context-specific, the methodology and research framework could be applied generally to better understand the localized vulnerability and to identify potential value conflict and collaboration for adaptation.

LOCAL MOTIVATIONS TO SEA LEVEL RISE ADAPTATION IN THE TAMPA BAY REGION

Abstract ID: 1302

Individual Paper Submission

HOLMES, Tisha [Florida State University] ttholmes@fsu.edu, presenting author
BUTLER, William [Florida State University] wbutler@fsu.edu, co-author

South Florida is on the frontlines of facing threats from climate change especially sea level rise and related effects of storm surge, inundation, salinization erosion, wetland loss. Local planners implementing adaptation planning face a multitude of barriers that impede the quality, timeliness, and frequency of adaptation initiatives. These include lack of leadership, resources and the uncertainty around planning for long range sea level rise is a significant barrier to the dilution of explicit federal and state guidance on sea level rise adaptation (Moser et al. 2010; Bierbaum et al. 2010; Hamin et al. 2014; Shi et al. 2015). The Florida Senate Bill 1094 “An act relating to the peril of flood” (Peril of Flood Act) which was signed into law in 2015, requires consideration of SLR and the effects of enhanced flooding in coastal element of comprehensive plan in order to guide future development projects. Consequently, there is a growing need to understand how municipalities are pursuing adaptation strategies to address sea level rise under this new state mandate.

This study seeks to understand the motivating factors for local adaptation to sea level rise guided by the Peril of Flood Act in the Tampa Bay Region. Projections for Hurricane Irma sounded dire warnings for Tampa Bay and highlighted the region’s critical vulnerabilities as the 2nd largest populous metropolitan area in Florida.

The paper answers the following research questions:

1. How are local municipalities responding to the Peril of Flood Act in the Tampa Bay region?
2. What are the factors influencing the extent of sea level rise adaptation actions in the Tampa Bay Region?

Data was collected through document reviews, plan reviews, content analysis of webinars and interviews with municipal and regional planners in the Tampa Bay Region. Preliminary results indicate that the extent of sea level rise adaptation in Tampa Bay is not a uniform process and operates along a continuum ranging from top-down vulnerability assessments supported by state resources to internal progressive collaborations, development of networks of learning and proactive policy responses. Specifically, most large urban municipalities such as Tampa Bay, Clearwater, St. Petersburg and Hillsborough identified vulnerabilities using unified regional sea level rise projections and are specifically planning to protect vulnerable transportation infrastructure. Some smaller municipalities such as Bel Air Shore rely on regional bodies such as the Tampa Bay Regional Planning Council One Bay Workshops and the Climate Science Advisory Panel to build capacity in order to perform vulnerability assessments.

This research highlights important ‘hard’ and ‘soft’ motivating factors which facilitate progression along the adaptation continuum: 1. Local and regional networks such as One Bay Resilient Communities creates non-political spaces to generate new ideas and can serve as sources of inspiration for uptake of these actions by members; 2. The guidance and financial resources from Peril of Flood Act is broad enough to give municipalities flexibility and external political ‘cover’ to pursue robust analysis and adaptation planning; 3. The availability of a unified, scientifically robust projections enabled more communities to use the projections to move forward in a credible and legitimate planning process; and 4. The presence of progressive planners, with broad discretion to innovate and implement ideas generated from local and regional networks. However, the outcomes of these adaptation planning efforts are limited by uncertainty and shorter planning time horizons which do not contemplate the multi-decadal impacts of sea level rise.

The results of this paper will resonate at the local and regional levels in Florida and can also translate to other states and localities facing similar risks and planning contexts in the Gulf Region. The results can provide guidance to local governments, particularly those in lower-resource communities, to offer the process steps and management considerations for engaging with regional bodies to facilitate the adaptation planning process.

NATIONAL CLIMATE JUSTICESCAPE AND GREEN INFRASTRUCTURE PLANNING

Abstract ID: 1315

Individual Paper Submission

CHENG, Chingwen [Arizona State University] Chingwen.Cheng@asu.edu, presenting author

LEE, Joomee [Arizona State University] Joomee.Lee@asu.edu, co-author

Communities around the world have experienced increasing climate change associated hazards that have impacted livelihood of millions of people. In the US, the remark of catastrophic 2005 Katrina is a wakeup call for community climate justice and 2017 Maria has once again demonstrated persist climate justice issues in social-ecological vulnerable communities, such as the devastations and social impacts in Puerto Rico. Climate justice examines spatial disparity of climate change associated hazards in relation to socially vulnerable groups (Cheng 2016a). Green infrastructure has been recognized as one of the critical climate change adaptation strategies in urban planning and design. A lack of access to green infrastructure for mitigating climate change-induced associated hazards such as heat (Jerenette et al. 2007) and floods (Cheng 2016b) among socially vulnerable groups would ultimately contributes to inequitable planning and climate justice communities.

Built on the previous study of climate justicescape in American cities (Cheng 2016b) that demonstrated spatial distribution and hotspots of climate justice areas in the United States based on spatial patters of historical extreme climate events and social vulnerability indices, this paper aims to incorporate green infrastructure mapping to answer the following question: to what degree do climate justice cities have access to green infrastructure? How have climate justice cities incorporated green infrastructure planning for climate change?

Green infrastructure is defined as interconnected natural and manmade open space that provides ecosystem functions (Tzoulas et al. 2007). In this paper, green infrastructure is identified as non-urban land cover categories from National Land Cover Database 2011 (NLCD2011). We then calculated the percentage of green infrastructure area at the unit of county level, which is consistent with social-ecological vulnerability assessment from the previous study. The results highlight the large metropolitan areas with climate justice patterns are also the areas

Finally, climate change action plans from the cities with climate justice hotspots are collected and apply content analysis for their goals and intended outcomes in using green infrastructure for addressing equity and climate change adaptation. Evaluation criteria include whether 1) the planning documents define social

vulnerability or associated socioeconomic indicators and whether social justice, 2) equity is listed and defined in their plans, 3) green infrastructure is identified as climate change adaptation strategy.

The results demonstrate that even though the climate associated disasters have been widespread, the socially vulnerable groups among the victims remain the least prepared for and having the most obstacles to respond to and recover from disasters. The findings support the evidence of climate justice persists at local scales and a lack of institutional change for addressing justice issues in climate change planning. Through raising the awareness of climate justicescape and green infrastructure asset, the findings help to inform planning policies for prioritizing resources in investing green infrastructure in areas with the greatest social needs under the consideration of climate change impacts and promote local climate justice planning.

THE CHANGING MEANING AND RESPONSIBILITIES OF URBAN SUSTAINABILITY PLANNING: THE CASE OF PHILADELPHIA

Abstract ID: 1368

Individual Paper Submission

ROSAN, Christina [Temple University] cdrosan@temple.edu, presenting author

Increasingly there are questions about both the concept and desirability of urban sustainability. Planners and scholars are recognizing that it is not enough to promote policies that are aimed at creating more sustainable cities (for example, investment in public transit, smart growth, transit oriented development, increasing density, bike lanes, energy efficiency, climate resiliency, and urban greening) without engaging in a larger conversation about social justice, race, class, structural inequality, and “just sustainabilities” (Agyeman, 2017). While planners often focus on place-making, the urban sustainability approaches that cities are adopting are increasingly viewed as contributing to larger, and troubling gentrification dynamics, often termed “green gentrification” (Anguelovski, 2016). This paper examines the way that the concept of urban sustainability and policies to promote it have evolved in Philadelphia over the past decade. While Mayor Nutter (2009) aimed to use urban sustainability planning as a means of revitalizing the city, in 2018, the tide has shifted and the political economy of Philadelphia has changed. Increasingly, urban sustainability is seen as a part of a larger, neoliberal agenda and there are very real political conflicts around sustainability planning that often divide on race and class lines. Using a series of mini-cases of conflicts around urban sustainability planning in Philadelphia over the past decade, this paper highlights how the conversation about urban sustainability and the associated policies has evolved in the city. The paper highlights the growing recognition that place-based strategies to make cities more sustainable are not leading to “just sustainabilities”. What is missing in Philadelphia are policy tools and planning techniques that promote urban sustainability planning and simultaneously respect the very real concerns from low-income and communities of color that they are, what Melissa Checker describes as, being “wiped out by the ‘green wave’” (Checker, 2011). I argue that policies to address displacement need to be coupled with urban sustainability efforts. Planning for urban sustainability that promotes “just sustainabilities” will require a rethinking of the siloed and fragmented nature of planning in the city. Planners need to work across agencies, collaborate with

communities, and be more creative about integrating sustainability goals with other goals such as promoting affordable housing, improving schools, promoting low-income home ownership, and innovating with tools such as community land trusts. Using a case study research method, this paper outlines a series of lessons for urban sustainability planners that come out of the Philadelphia experience.

EXPLORATION ON THE DEVELOPMENT PATH OF CHARACTERISTIC SMALL TOWNS BASED ON INDUSTRIAL TRANSFORMATION IN CHINA - A CASE STUDY OF GAOCHENG CHARACTERISTIC SMALL TOWN PLANNING

Abstract ID: 152

Poster

HAN, Huidong [Tongji University] 254606814@qq.com, presenting author

Small towns have been playing an important role to connecting urban areas and rural areas, constructing small towns is very essential for China's urban-rural integration development. Under the background of New Normal, the traditional planning, focusing on spatial planning and aiming at economic growth, has been unable to adapt to the current development needs of small towns. People are facing with great pressure on the resources, the environment and the labor force etc. So the development and nurturing of characteristics small towns becomes the key. This study through analyzing the status and problems of characteristic small towns, summarizing the changing of planning ideas of the characteristic small towns under the 'Zhejiang Model'. Taking the planning of Gaocheng characteristic small town in Yixing city as an example, and from the prospective of determine factors of characteristic small town's construction, its industries. Then exploring the choice of industry position and specific strategies for implementation, upgrading industrial structure and value-added hierarchy with the innovation-driven. Under the guidance of development experience of Zhejiang, the planning of Gaocheng characteristic small town made a clear judgment and choice. It determined the environmental protection industry as the leading industry for development, and gradually decreasing the cable manufacturing which is the main economic growth point of industrial development currently. Finally by implementing the specific elements, the final spatial planning program lay out. Its industrial transformation ideas and planning methods giving a certain reference to other characteristic small towns. The study of Gaocheng also illustrates that the long-term growth of regional economy driven by the continuous upgrading of industries has become an inevitable trend of urban and rural development under the new normal. Small towns as an important medium connecting cities and rural areas, more necessary to discovering and cultivating their own characteristic industries, then developing into a characteristic small towns. Moreover, this will enhance the quality of China's urbanization and develop in a more healthy and coordinated pattern.

SOCIAL VULNERABILITY AND FLOOD DAMAGE: NEIGHBORHOOD DISPARITIES IN FLOOD DAMAGE DUE TO HURRICANE HARVEY IN THE CITY OF HOUSTON

Abstract ID: 426

Poster

LEE, Jessica [Texas A&M University] jjlee8605@tamu.edu, presenting author

VAN ZANDT, Shannon [Texas A&M University] svanzandt@arch.tamu.edu, co-author

Hurricane Harvey hit the U.S. and caused catastrophic damage in Texas in August, 2017. Harvey inflicted nearly \$200 billion damage due to widespread floods in the City of Houston area. News articles show inconsistent results regarding equity of flood damage due to Harvey. Specifically, some point out that Harvey hit all incomes evenly. Others report that damage is disproportionately distributed. Social Vulnerability (SV) and Environmental Justice (EJ) research (Highfield et al., 2014; Peacock, 2003; Zahran et al., 2008) has revealed disparity in the impact of hazards, mostly in the evacuation and recovery process, at the county level, census tract level, or household or individual level. Limited research examines the relationship between social vulnerability and flood damage at the neighborhood level.

To fill this gap, this research examines the physical damage of housing units across the block group, the minimum neighborhood unit within which has similar demographic characteristics, in social vulnerability perspectives. The research is a factual basis analysis revealing the disparity in flood damage across the neighborhoods in the City of Houston with real assessed damage dataset. Specifically, we address the following question: Does neighborhood socio-economic condition relate to the flood damage of housing?

We utilize Harvey damage assessment dataset in the form of GIS shapefiles provided in open data Houston website (<http://data.houstontx.gov/dataset/city-of-houston-harvey-damage-assessment-open-data>). The dataset includes the number of affected single family units and multi-family units and socio-demographic information in each census block group. We examine the proportion of affected housing units in each block group and use statistical analysis to answer the question.

Given the EJ and SV research, we expected that socially vulnerable neighborhoods have more damaged housing units even controlling for population density and exposure to hazard. The finding has substantial implications for how the reduction of flood damage for socially vulnerable populations may be achieved. Understanding the relationship between social vulnerability and damage at the neighborhood level will be helpful to develop land use and hazard mitigation planning to make the hazard risk more equitable.

THE EFFECT OF NATURAL DISASTER ON POPULATION DISPLACEMENT AND LAND USE CHANGES: IN THE CASE OF REPUBLIC OF KOREA

Abstract ID: 613

Poster

LEE, EUN WOO [University of Seoul] leeew94@naver.com, presenting author
SONG, Jaemin [University of Seoul] jmsong@uos.ac.kr, co-author

The increase in the frequency and strength of extreme weather events requires countries and cities to get prepared for and cope with potential impacts of climate change. As natural disasters become more complex, larger in scale and unpredictable, strategic national and local spatial planning is key to establish resilient human settlements to future climate change and natural disaster. While there is a growing interest in disaster mitigation and management in Korea, natural disaster has not been the major interest in the field of spatial planning. The current urban planning does not fully incorporate the potential impacts of climate change. Thus, it is important for the future urban and national planning to take into account the impacts of the coming climate change and natural disaster. As the first effort to this end, the research aims to analyze the impact of natural disasters on population displacement and land use changes in the case of Republic of Korea. Against this backdrop, a panel analysis will be conducted by using a net change in population as a dependent variable and data on human and property loss due to natural disaster as independent variables with other control variables. The results of the research are expected to provide empirical grounds for the need of spatial planning and identify key influential characteristics of natural disasters that have significant effects on population movement and land-use changes.

PERCEPTIONS OF A WICKED PROBLEM: SITUATION ASSESSMENT OF WATER QUALITY ISSUES IN THE JORDAN RIVER WATERSHED

Abstract ID: 624

Poster

BANERJEE, Debolina [University of Utah] banerjee15d@gmail.com, presenting author
HINNER, Sarah [University of Utah] sarah.hinners@utah.edu, primary author
CLARK, Brett [University of Utah] brett.clark@soc.utah.edu, co-author

The Jordan River Watershed in north-central Utah exemplifies urban stream environments throughout the western United States. It faces a variety of challenges like population pressure, increased urbanization, higher impervious

surfaces etc., which influences water quality throughout the watershed. This diverse mix of concerns is interwoven with assorted stakeholders and social organizations in the river basin, such as; local municipalities, water treatment plants, water users, local universities, state and federal agencies to name a few. The interplay of these actors in this socio-ecological system creates what is known as a ‘wicked problem’. Linear problem solving is not adequate to address the multifaceted interactions in this watershed. Our study has thus considered this planning unit [Jordan River Watershed] as a complex, non-linear system where the various agents [stakeholder] are loosely integrated in an interdependent network.

Our hypothesis is that a regional stakeholder driven approach to water quality issues will prove more cost effective and environmentally beneficial than individual projects. The goals of this study are to gauge the stakeholder perception of this ‘wicked problem’ and to document existing knowledge and capacity to holistically tackle the issue which is situated in this cross-scalar complex system of Jordan River Watershed.

We are conducting a situation assessment between stakeholders of diverse but interdependent interests associated within the Jordan River Watershed. Face-to-face interviews are conducted with 30 key stakeholders in the watershed. Through the stakeholder assessment, we are able to characterize the current state of local adaptive capacity within and between stakeholder groups and communities, explore distinct stakeholder interests and concerns and highlight the unique challenges and possibilities. The specific research objectives are: to map the stakeholder landscape in terms of interests, positions, epistemology, perceptions, and values; to assess stakeholder individual and collective capacity to address risks and challenges; and to assess whether collaborative decision-making processes enhance knowledge, connections, and the ability of stakeholders to find solutions to wicked problems.

Our findings help understand community resilience and adaptive capacity based on three components: knowledge, connections, and options. Knowledge is simply access to sufficient credible, accurate, and relevant information about the watershed as a system to understand how it works and how particular actions may affect it. Connections has to do with networks of individuals and organizations that individually or collectively have the power to take action to affect the system. Options is a measure of a state of the socio-ecological system: what array of actions are available to influence the trajectory of the system? This is done by mapping stakeholder epistemologies through mental models created from interviews.

The main significance of this study is linked to the practice of collaborative regional planning. Authentic dialogue helps establish jointly constructed knowledge through interaction and team learning. Agents interact dynamically exchanging local heuristics while creating a knowledge pool that can be distributed throughout the entire social system [Innes and Booher, 2010]. Bringing these local stakeholders together helps tap the local knowledge that is practical, collective, and strongly rooted in a particular place [Geertz, 1983]. Understanding how and where this knowledge is generated is essential for understanding the inter-play of various links in the complex system of this watershed and attempting to solve the ‘wicked problem.’ We present and compare stakeholder position/interest “maps” and the epistemologies that inform and support them as an approach to understanding and communicating the complexity of wicked problems.

ESTIMATING COOLING EFFECT OF URBAN GREEN AREAS USING RANDOM FOREST PREDICTION MODEL

Abstract ID: 685

Poster

JEONG, Ha-Uk [Ulsan National Institute of Science and Technology] jhw0921@unist.ac.kr, presenting author
CHO, Gi-Hyong [Ulsan National Institute of Science and Technology] gicho@unist.ac.kr, co-author

Rapid urban growth has resulted in increases in the amount of impervious surfaces in cities, inducing changes in urban climates, which are generally warmer than their rural surroundings. This phenomenon is known as the urban heat island (UHI) effect (Kim et al., 2017). Previous studies analyzing the relationship between urban form and UHI have shown that urban green space can effectively reduce UHI intensity (Kong et al., 2014). However, many studies have analyzed the UHI intensity using land surface temperature (LST) since it is extremely difficult to accurately measure the surface air temperature for a wide range of urban spaces. Because the LST is a measurement of how hot the land is to the touch, it is different from the thermal condition in which people actually feel.

Due to recent advances in machine learning techniques, the predictive power of the model has been greatly improved. Accordingly, in the remote sensing studies, the LST data was often used for predicting the maximum air temperature of the day. Most of these studies have used the LST data retrieved from MODIS of 1 km resolution (Yoo et al., 2018), but such a low resolution of estimated air temperature made it difficult to find meaningful implications and interventions for mitigating UHI through land uses planning.

This study aims two. First, using the 30m unit of Landsat data, we predict the surface air temperature at microscopic scale by applying random forest prediction model. Second, we estimate cooling effect of urban green areas using the prediction model.

The study was conducted in two stages. The first was developing random forest models for estimating the surface air temperature, and the second stage was estimating cooling effect of urban green areas. Random forests technique is an ensemble method that randomly learns multiple decision trees. For the analysis, we have collected nine cloud-free Landsat images from 2013 to 2016 for hot summer days in the study area, and corrected the LST in different days using Surface Energy Balance Algorithm for Land (SEBAL). The number of Automatic Weather Station (AWS) in the study area was 52. Meteorological variables included Albedo, elevation, longitude, latitude, and Julian Day. The vegetation variables were Normalized Difference Vegetation Index (NDVI), Weighted Difference Vegetation Index (WDVI), Soil Adjusted Vegetation Index (SAVI) and Leaf Area Index (LAI). The variables related to urban development were impervious area ratio, building coverage area and average height of buildings within 100m and 400m buffered area. The results of Random Forest models were tested using 10-fold cross validation method.

The model performance of the random forest estimation ($R^2=0.9$, $RMSE=0.73$) outperformed the performance of previous models (Ho et al., 2014). The 9-year average temperature prediction showed a slightly better performance in terms of RMSE (0.53). Julian day appeared to be the most important predictor of the model and LST was found to be the second most influential factor. Accounting for the fact that Julian day is a variable representing solar radiation, solar altitude, and solar azimuth, the surface air temperature was largely influenced by solar activity.

The random forest model in the first stage was retained for the next stage of analysis. For identifying cooling effect of the urban green space, we will examine the surface air temperature on the urban green areas and decline of Cool Island by the distance from the green areas.

ELIMINATING "RESOURCE CURSE" AND BUILDING RESILIENT CITY - BASED ON THE STUDY OF TYPICAL RESOURCE-BASED CITIES IN CHINA

Abstract ID: 738

Poster

FAN, JIAHUI [Tongji University] fanjiahui043@163.com, presenting author

Resource-based cities tend to fall into the "resource curse" due to the strong dependence of resources and the single industrial structure, which shows that urban development is more volatile and anti-risk ability is poor. Therefore, the transformation of resource-based cities are imperative. The fundamental goal of the transformation of resource-based cities is to build a resilient city, which is also the key to breaking the "resource curse".

Shanxi Province is a typical province of coal resources in China. With the advent of "New Normal of Energy", the price of resources such as coal has dropped sharply. The urban development mode that originally relied on energy economy is unsustainable and has been deeply trapped "Resource curse". Taking Datong, Yangquan and Shuozhou as examples, this paper analyzes the basic characterization of resource-based cities and resource-based finance, summarizes the economic development path of resource-based cities and the three predicaments of "resource curse", and then to explore the ideas to get rid of "resource curse" and building a resilient city.

The primary determinants are as follows. (1) Datong and Yangquan developed earlier, which are more mature than Shuozhou. However, Datong and Yangquan have also exposed many problems. Datong started the transformation firstly, however, in recent years, the dependence of local finance on land finance has risen., Yangquan has not achieved remarkable results in its transformation in the face of various difficulties and inadequate coping measures. Shuozhou is still relying on the rapid development of resources, but also needs good job of planning in advance, to avoid the mistakes of similar cities. (2) There are three main causes of "resource curse", Structural difficulties- resource dependence of "coal alone" and lack of economic motivation; Policy difficulties-government positioning deviation, inexperience and slow response; Governance difficulties-conservative ideas and political deterioration. (3) Building a resilient city is a new way for cities to achieve sustainable development, resource-based cities need to upgrade industrial and change the diversified structure, improve the government functions, standardize the order and strengthen the security system, and so on.

Resources-based cities can only effectively eliminate "resource curse" and achieve sustainable economic, social and environmental development if they are really built into a resilient city.

THE RESOURCE AND ENVIRONMENT ASSESSMENT METHOD BASED ON BOTTOM-LINE THINKING

Abstract ID: 740

Poster

OU, Xiaoli [Tongji University] Crystaloxl@163.com, presenting author

China's first proposed ecological protection red line in 2011, which is an important institutional innovation in the field of environmental protection in China. In February 2017, Chinese government issued "Opinions on the delineation of ecological protection and adherence to the red line". It stressed ecological protection red line again. For ecological protection and urban development, ecological red line is a kind of "bottom-line thinking", which is a prudent way of thinking, focusing on the crisis, risk and prevention. In non-reversible urban ecosystem, the bottom line plays the role of "guaranteed minimum," "minimum line of defense," and "crisis minimization."

This article aims to clarify what is the ecological "bottom line" and how to delimit the ecological bottom line in resource and environmental assessment. Based on theoretical research, combined with a series of planning practices, case studies and GIS analysis, we will explore the methodological framework for resource and environmental assessment to ensure the ecological integrity of the planning scope and define the limit scale of the growth boundary.

We combine the results of the research and form a technical framework for resource and environmental assessment methods based on bottom-line thinking: determine the scope of the study based on the minimum unit of the river basin, analyze the ecological resources within the scope of the study to determine the ecological security pattern, and then conduct space control and clarify the boundary based on the ecological bottom line. First, determine the scope of planning and research. This paper takes Yunlong New Town planning in Zhuzhou City as an example. We propose to define ecological research units at natural scales. We use GIS and professional hydrology analysis software to conduct basin analysis, and use the smallest watershed covering the planning scope as the research unit. Next, analyze the planning security pattern. Water, terrain, animal communities, mineral resources, etc. should be analyzed. Take the Sihe River Basin Conservation Plan as an example, comprehensively combining the strict control elements to identify resources safety patterns, combined with analysis of other urban ecological factors within the ecological line, to comprehensively determine the ecological security pattern. Finally, delimit the ecological bottom line and determine the space control. Based on the research scope and the security pattern, we compare the delimitation of ecological bottom lines in Wuhan, Quanzhou, and Guangzhou planning. Through the environmental bearing capacity, the area of the ecological bottom line can be predicted, delimited and unified management.

The exploration of the "bottom line of thinking" in different cities has provided many cases and practical experiences. On a whole, reforming the ecological planning in China's spatial planning system, establishing efficient planning and management and overall order, and optimizing space governance require both the first transformation of technological approaches and the transformation of ideas and model innovation at the level of urban thinking.

RESILIENCE INDICATORS AND MEASURING VULNERABILITY TO COASTAL HAZARDS

HAN, Sa Min [University of Pennsylvania] hansamin7@gmail.com, presenting author

As climate change threatens coastal areas at risk of inundation and flooding, accurate measures to assess and diagnose the current hazard levels have been absent. Yet they are essential to allocate limited resources for appropriate resilience programs. For more than forty years, since the UN Conference on the Human Environment held in Stockholm in 1972, environmental advocates, including city planners, have been developing indicator systems to meet this need. They aim to provide guidance for policy-relevant comprehensive and scalable information-driven processes understandable to laypeople and practitioners alike. They have introduced many urban indicator systems for resilience planning, mainly in response to several highly destructive natural disasters. This study explores the historical development of urban resilience indicating systems in order to apply them to the specific site of South Korean coastal regions for validation testing.

This research is composed of two parts. First, I historically examine the academic and practice-oriented studies on urban resilience indication systems and discover the need for a standardized system for urban resilience as a reference for various governments and organizations. This part includes recent studies, such as the United Nations Environment Programme (UNEP), the Intergovernmental Panel on Climate Change (IPCC), the United States Geological Survey (USGS), and the National Oceanic and Atmospheric Administration (NOAA), regarding how to differently measure and confirm coastal resilience using various definitions and goals.

Second, I employ basic spatial regression and GIS modeling analysis to determine whether the global-scaled indicating system can apply to the national-scale area. I evaluate the current coastal vulnerability of Korean coastal regions by applying the UNEP's framework as a pilot test. This part also includes some geospatial analysis to define flood characteristics and to assess flood vulnerability at the national level. Each result is codified in a map format for easy policy implementation. These analyses discover how the different scaled actors, such as global organizations, national governments, and local authorities, can coordinate for overall coastal resilience and their positive interaction.

An objective and accurate understanding of the current state of disaster resilience will help to isolate the problems during the policy decision process. In this context, this research can provide a clear direction to the Korean government for building better coastal resilience planning and future preparation. Along with coastal resilience, the methodology of spatial statistics also has untapped potential in this field. Through the interaction of these two areas of thought, a practical indication system that can be applied to real-world problems will be developed for future studies. This review and the application of coastal vulnerability indexes and modeling of an indication system can positively inspire adaptation strategies for coastal areas in this time of dramatic climate change.

HIGH-RESOLUTION MICROCLIMATE MAPPING IN THE TECH CLIMATE NETWORK

MALLEN, Evan [Georgia Institute of Technology] esmallen@gatech.edu, presenting author
STONE, Brian [Georgia Institute of Technology] stone@gatech.edu, co-author
LANZA, Kevin [Georgia Institute of Technology] lanza.kevin@gatech.edu, co-author

Extreme heat poses a significant threat to human health, and is expected to worsen in a warming climate. In response to both global and local scale climate change due to the urban heat island (UHI), temperatures in the Atlanta region have been rising more rapidly than in previous decades. More effective monitoring of climate trends on campus, in concert with climate-responsive design strategies, can lessen both the human impacts and infrastructure costs of rising temperatures. The Georgia Institute of Technology's Urban Climate Lab has established a dense network of temperature and relative humidity sensors throughout the campus to identify the location of hot spots, measure the impact of ongoing development on micro-climatic conditions, and assess how the use of vegetation and cool materials around campus can moderate warming trends. Georgia Tech's campus provides an ideal location for exploring microclimatic activity both spatially and temporally. This study seeks to answer: what is the impact of impervious surface cover, surface-level vegetation, and overhead tree canopy on air temperatures?

Methods

We monitored air temperatures at 25 sites across campus over the summer of 2017 and analyzed the amount of surface-level land cover classes within 100 feet of each site including sidewalks, streets, buildings, and landscaped area, along with tree canopy area above or around each site. We correlated these land cover variables with the full-summer average daily minimum, mean, and maximum temperatures, as well as number of hot days over the summer defined as a day that exceeds the 90th percentile maximum temperature for Atlanta's 30-year climatology.

Results

Our results show that the UHI is not one large hot spot across the city, but rather a collection of distinct microclimates with max temperatures ranging from roughly 1.4 to 6.8°F warmer than a rural control site on average. Similarly, number of days above the 90th percentile maximum temperature range from 7 days in the coolest areas to 56 in the warmest areas. The landcover regression analysis shows that land cover performs fairly well in predicting minimum and average temperatures, and less well in predicting maximum temperatures and the number of hot days. Minimum temperatures are significantly predicted by streets, sidewalks, and buildings. These materials absorb and store incoming solar radiation, releasing it slowly as sensible heat throughout the night. The influence of vegetation became more significant in predicting maximum temperatures and hot days than minimum temperatures. While landscaping never emerged as a significant predictor, tree canopy displayed a strong relationship, reducing maximum temperatures by 0.52°F for each percent increase in canopy cover.

Significance

This study illustrates the significance of land cover on UHI intensity across Georgia Tech's campus, and shows how small each microclimate can be. This information can help urban planners prepare for rising temperatures from a warming climate and increased urbanization. Heat mitigation planning that incorporates vegetative strategies can significantly protect vulnerable populations adapt to extreme temperatures and enhance local resilience. Cities must begin to monitor local temperatures now as a first step toward creating a resilient urban environment and population. This information can help urban planners and public health officials improve their emergency response plans and communication strategies for heat mitigation in urban areas by specifically targeting short and long-term responses where temperatures are most extreme. By characterizing the thermal properties of built and natural environments, this method allows urban planners to estimate local air temperatures without deploying a dense network of sensors across the entire city. Understanding which neighborhoods are at greatest risk of extreme temperatures can help planners shape the policies necessary to combat the impacts of climate change tailored to their local context.

BAKIN, Joshua [Georgia Institute of Technology] jbakin3@gatech.edu, presenting author

MALLEN, Evan [Georgia Institute of Technology] esmallen@gatech.edu, co-author

STONE, Brian [Georgia Institute of Technology] stone@gatech.edu, co-author

In addition to the threats of a warming global climate, urbanization exacerbates extreme local temperatures due to the urban heat island (UHI) effect. This paper presents an ongoing study of urban and rural temperature trends in proximity to the most populous metropolitan areas of the US. As data from urban meteorological stations are typically eliminated or adjusted for use in continental and global analyses of climate change, few studies have addressed how temperatures are changing specifically in the areas most vulnerable to the public health impacts of warming: large cities. In this study, temperature data from urban and proximate rural stations for large US metropolitan areas are analyzed to establish the mean decadal rate of change in urban temperatures, rural temperatures, and UHI intensity over the last three decades. Additionally, this study analyzes the methodological challenges in UHI definition by comparing sensitivities of different rural station selection protocols.

Methods

Climate station data is often “homogenized” when included in large-scale analyses such as national or global averaging, often removing the influence of urbanization to focus on the background warming trends rather than the urban heat island effect. To ensure that this signal is not removed, this study used only unadjusted GHCN-Daily station data obtained via Applied Climate Information System (ACIS) web services. All data were quality checked to remove any stations with confounding effects based on the physical location and management of the stations themselves. Any station that has moved more than 200 feet over the study period was removed. Similarly, any station with excessive missing data was also removed. Stations were classified as either urban or rural using satellite-derived night light data. Each urban station was then spatially matched to the nearest 3 rural stations within 250 km and the median decadal temperature trend among these rural stations was selected for comparison with their respective urban station.

Results

This study found that on average, the most populous cities in the continental US have been warming at a rate of 0.51 degrees F per decade between 1988 and 2017. Meanwhile, their surrounding rural areas have been warming at a rate of only 0.40 degrees F per decade over this time period. This means that while both urban and rural areas are warming, urban areas are warming at a rate of 0.11 degrees F per decade faster than their surrounding rural areas. This difference increased to 0.15 degrees F per decade on average when selecting only the nearest rural stations to the city, and reduced to 0.10 degrees F per decade using only the farthest rural stations.

Significance

This study provides evidence of the strong influence urbanization can have on the local climate. It has long been known that the urban heat island effect results in elevated temperatures within urban areas, but little attention has been paid to the acceleration of this effect as cities continue to grow and develop. Furthermore, this study illuminates the challenge of defining UHI intensity, as the intensity is sensitive to the method of rural station selection. As populations continue to move into cities, vulnerability to extreme heat events will be an ever-increasing threat to public health. While current climate policies tend to focus on atmospheric warming, this study shows that it is just as important to focus on issues related to urbanization and the urban heat island to control local and regional warming, and to protect these vulnerable urban populations.

THE FATE OF LARGE UNPROTECTED FOREST LANDS IN NORTH CAROLINA: THE ROLE OF LAND-USE PLANNING AND NON-PROFIT LAND TRUSTS

Abstract ID: 1206

Poster

TREADO, Anna [Clemson University] atreado@clemson.edu, presenting author

One of the most universally accepted principles in conservation biology is the principle of bigness, or that large patches of habitat are better than small patches (Noss, O’Connell, & Murphy, 1997). However, in the southeastern United States most land is privately owned and, therefore, maintaining large, contiguous areas of habitat is difficult due to the sheer number of private landowners making uncoordinated land use decisions. As land ownership becomes more and more fragmented (parcelization), the difficulty of implementing conservation plans increases further. The ability of the public to influence land-use on private lands can be loosely divided into two strategies, regulations or incentives. Land-use regulations, such as zoning, subdivision regulations, or urban-growth boundaries, are used by local governments to shape future land use by limiting or preventing uncoordinated development. Incentives, on the other hand, are often voluntary and are used to entice individuals to maintain private land in ways that benefit the public through subsidies such as reduced taxes or direct payments from the government.

One such incentive is the federal tax deduction for donation of a permanent conservation easement or payment for selling a conservation easement on one’s property. Non-profit land trusts have become instrumental in influencing land use through the use of conservation easements. This increased dispersion of planning authority, away from the state and towards third parties, such as land trusts, is highlighted by the sharing of discretion over use of government funds with multiple agents of change (Fairfax & Guenzler, 2001). This has resulted, however, in some criticism from scholars who raise concerns regarding the consequences of allowing private entities to enter into contracts with landowners that dictate the uses of a property into perpetuity without input from the public. These researchers have criticized the devolution in land-use planning authority to non-state actors, citing the ways in which land-use decisions are becoming privatized and excluding the public (Morris, 2008). They argue that this has resulted in a lack of transparency and a lack of data availability on protected lands (Merenlender et al., 2004). Conservation easements have been termed “the invisible forest” (Pidot, 2011) because their locations are often undisclosed by land trusts and therefore potentially unknown by local planners and others in the conservation community. This leads to problems in terms of enforcement as well as an inability to engage in effective strategic conservation planning (Owley, 2011).

Despite the above criticisms, private landowners continue to convey conservation easements to land trusts, signaling that land trusts are fulfilling a role in influencing land use that is desired by at least a subset of the public. Non-profits have a role in a mixed economy when for-profit firms and government action have failed to provide adequate quantities of public goods. However, little research has investigated the relationship between outcomes of government land-use controls and the activity of land trusts (Gerber 2012; Gerber & Rissman, 2012).

This study describes the changes in land ownership and parcel size of forested parcels in North Carolina, USA, between 2006 and 2017, and the relationship of these changes to government land-use policies and non-profit land trust activity. Although the process of parcelization does not in and of itself cause habitat fragmentation, parcelization is considered a critical step in the change from natural resource land use to land development (Haines and McFarlane, 2012). Information about the rate of forestland parcelization and its relationship to specific land-use policies is lacking. Additionally, the role of land-trusts in preventing forestland parcelization needs to be clarified, given the criticisms regarding their involvement in land-use planning.

VAZQUEZ CASTILLO, Maria Teresa [Universidad Autonoma de Ciudad Juarez] teresa.vazquez@uacj.mx

In recent years, Confederate monument removal in the US South has become a critical demand in urban anti-racist social movements. While newly visible, these actions continue decades of work to remove Confederate, colonial and other oppressive symbols from shared spaces and institutions as a step to dismantling their legacies. Yet some want to preserve these public sculptures as historical artifacts or for their cultural significance. These debates have entered many universities, which are attempting to chart a path away from their colonial and slaveholding pasts, while also honoring the experiences of their alums. Simultaneously, monument building continues as societies commemorate significant events, as nation and community building, or to recognize people and events that symbolize justice and equality.

Hundreds of grassroots memorials have emerged as an equally significant force. Family and friends resist erasure and express grief when they create street shrines by placing photos of young people killed by violence on city streets along with professions of love and stuffed animals. Public commemorative and political action has disrupted the conditions that made Missing and Murdered Indigenous Women and Girls invisible and therefore the situation possible. Ghost bikes have appeared in cities throughout the world, recognizing individual loss and dangers facing cyclists. Some memorials are ephemeral and other become semi-permanent as they stay in place through time.

These public sector, community and grassroots actions reflect deliberate decisions about public storytelling and visions for collective futures. The purpose of this roundtable is to explore varied perspectives on public memorials, memorialization and responses to monuments enacted in past eras. The roundtable examines the motivations and outcomes of contemporary monument building and removal, conflicting experiences with public monuments, the possibilities for using memorials in processes of truth and reconciliation, as well as how to teach these subjects in a divisive era and as moments to envision different futures. The diverse cases include US Confederate monuments, an independence monument in Haiti, commemoration of war, traumatic events and national disasters, and grassroots actions to draw attention to injustice. The roundtable continues decades of conversations about how planners can engage with conflicted histories and storytelling to build inclusive but honest alternatives, and newer issues about the ongoing importance of built environments and artifacts in a virtual era.

Questions for panelists:

- What are contemporary motivations and purposes for public monuments, memorials and memorialization?
- What is the significance of grassroots memorials?
- Who decides? Who builds? Whose stories? Which spaces?

- Should municipalities or other public institutions ensure that public memorials help to inclusive public realms? Can they do so?

ROUNDTABLE: CENTERING PUBLIC EDUCATION EQUITY IN PLANNING RESEARCH

Abstract ID: 644

Roundtable

BIERBAUM, Ariel [University of Maryland, College Park] bierbaum@umd.edu, moderator
 MAKAREWICZ, Carrie [University of Colorado Denver] carrie.makarewicz@ucdenver.edu
 GIBSON, Huston [Kansas State University] hgibson@ksu.edu

Increasingly, planning researchers and practitioners have recognized the mutually constitutive relationship between domains of planning and public education. Research across related disciplines has demonstrated that external factors such as poverty, hunger, violence, housing instability and homelessness, community disinvestment, legacies of and persistent segregation and transportation affect education outcomes and access to high quality schools. Further, education quality is strongly linked to social mobility. When students do not have access to high quality schools, due to upstream influences, the downstream outcome is continued disparities in social mobility between those with good education and those without.

Planning research and practice strongly influences those upstream conditions for learning. Researchers also study planning solutions to address the downstream disparities. Yet, the planning discipline has struggled to center public education as a cohesive research thread or sub-field. Transportation planners look at schools as traffic generators and opportunities to promote active travel. Land use and smart growth planners see them as triggers for sprawl and barriers to urban infill. Community development and housing researchers connect schools alternatively to segregation, shared use facilities, or opportunities for promoting revitalization. In addition, educational researchers have also focused on policies to improve educational equity and quality without adequately considering the interconnection with these other domains.

This roundtable will bring together planning scholars and educational researchers engaged in research grappling with the interactions between the built and social environments and school districts, access to high quality education, and ultimately equity and social mobility outcomes for children and youth in marginalized communities. Roundtable participants' projects span the United States and beyond and focus on: neighborhood and school segregation, public school closures, transportation and school access, the outcomes from school choice systems, housing mobility, comprehensive community development, school facilities infrastructure and land uses, and learning places as frameworks for neighborhood planning.

Across this diversity of projects, our goal is to discuss the ways that more explicitly defining and centering schools in planning research helps us not only support high quality public education, but also advance planning scholarship and practice – theoretically, empirically, and methodologically. The following questions will guide our discussion:

- -- How do you incorporate or frame schools, school quality, and education-related social mobility within your research?

- -- How does centering public education in your research help you advance knowledge and theory within your domain of planning? Do schools, in their various functions, fill a gap in your policy or planning domain? Alternatively, how do you center other domains like transportation and housing in your educational research?
- -- What methodological approaches have you used to consider the intersection between planning domains and educational systems? What methodological challenges have you faced?

Moderator: Ariel H. Bierbaum, Assistant Professor, University of Maryland

PRE-ORGANIZED SESSION SUMMARY

INCLUSIVITY & RIGHTS: CREATING AN URBAN SPACE FOR IMMIGRANTS & REFUGEES

Summary ID: 14

Abstract ID: 158

Abstract ID: 161

Abstract ID: 162

As we face the time of heightening global inequality and mass migrations caused by political instability and climate change, the role of planning has never been as important as it has become now. Fueled by rapid urbanization around the world, these changes have led planners and scholars to pose the question, "how do we manage urban space for these migrant populations coming from various backgrounds?" This session is organized to engage planning scholars in the discourse on this very fundamental question from a theoretical point of view. In particular, a focus will be placed on how cities can be more inclusive for immigrants and refugees in a way that they properly exercise their right to the city and contribute to the making of the urban space. Drawing on case studies of various topics such as suburban place-making, municipal zoning, advocacy planning, and experiences of refugees in cities during resettlement, the session will serve as an invaluable opportunity in exploring what has been done and setting a direction for the future planning scholarship on immigrants and refugees.

Objectives:

- To explore current state of literature in the field and how existing planning theories have been applied to planning practice.
- To find gaps in current theory and practice and discuss how "rights" and "inclusivity" can/should be incorporated in planning scholarship.
- To diagnose the need for a new theory for planning and immigrants and refugees and propose proper scholarly directions.

NEGOTIATING SPACE AND RIGHTS: MULTICULTURAL PLANNING IN TORONTO'S IMMIGRANT SUBURBS

Abstract ID: 158

Group Submission: Inclusivity & Rights: Creating an Urban Space for Immigrants & Refugees

ZHUANG, Zhixi Cecilia [Ryerson University] zczhuang@ryerson.ca, presenting author

The Toronto area has attracted the largest proportion (nearly 40%) of the country's immigrants. It is renowned for its multicultural diversity, which is not just reflected in its multi-ethnic population composition, but is also manifested in many tangible and physical ways. Ethnic neighbourhoods are highly visible indicators of Toronto's multiculturalism, where immigrant businesses cluster together along with other ethnic-oriented institutions (e.g., places of worship, ethnic schools, community centres, etc.) to serve the needs of the co-ethnic community and beyond. In the Toronto area, many of these ethnic neighbourhoods have been established in the suburbs, where contemporary immigrants tend to settle and concentrate. The influx of immigrant businesses and institutions has readapted and transformed existing suburban neighbourhoods and created vital retail and community spaces (Zhuang, 2017).

Research has confirmed that immigrants play important roles in restoring social, cultural, and economic vitality to declining areas. However, what remains unclear is how immigrants have negotiated political power and claimed space and rights within host cities and societies (Rios and Vazquez, 2012). Furthermore, municipalities have not yet developed responsive policies and processes to address the opportunities and challenges brought forth by suburban immigrant settlement. Multicultural planning advocates have urged planning practitioners to be more proactive in responding to the needs of ethnocultural communities, and create inclusive and meaningful urban spaces that put people's diverse needs, values, and cultural preferences at the forefront of planning practices (Burayidi, 2015). However, there is insufficient empirical evidence that the good intention of multicultural planning is truly embraced in planning policies, processes, and practices (Qadeer and Agrawal, 2011). Municipalities need to develop a clear understanding of the processes and mechanisms involved in the making of immigrant suburbs, and how to engage immigrant communities in the making of inclusive spaces.

As part of a larger scale research focusing on the making of immigrant suburbs, this paper investigated the evolution of three suburban immigrant neighbourhoods in the Toronto area. It aims to explore the following research questions: How have immigrant communities got involved in the development and transformation of these ethnic neighbourhoods? How did they claim their space and rights when tensions and conflicts over resources and land uses arose and how did municipalities respond? What is the role of planners in the negotiation of space and rights among different users whose priorities, preferences, and needs are at odds with each other? Multiple data collection methods were adopted, including reviews of secondary documents (e.g., municipal policies, staff report, council minutes), census data, site observations, semi-structured interviews and focus groups with key informants (e.g., ethnic entrepreneurs, city officials, community leaders, developers, architects), and a consumer intercept survey.

As revealed in this study, the rapid development of the three neighbourhoods over the last several decades, however, have not been fully recognized or supported by planning authorities; it was mainly a result of community mobilization. Conflicts related to land use, public engagement, and public realm development continue to arise, exposing planning's failure to keep pace with the changing needs of diverse communities. The lessons learned from the case studies reveal that planners tend to rely on their own expertise and impose their

power through regulations and uses of urban spaces. Without proper consultation with community members, the planning process further marginalizes minority groups. This lack of communication and negotiation suppresses cooperation between groups in building inclusive communities.

ADVOCACY PLANNING: A POWERFUL CONTEMPORARY TOOL FOR SOCIAL INCLUSION

Abstract ID: 161

Group Submission: Inclusivity & Rights: Creating an Urban Space for Immigrants & Refugees

REARDON, Kenneth [University of Massachusetts Boston] kenneth.reardon@umb.edu, presenting author

Central Theme/Research Hypothesis:

In November of 1965 Paul Davidoff, a young member of the University of Pennsylvania planning faculty, published his most influential article, “Advocacy and Pluralism in Planning”. This article criticized mainstream planning for its near exclusive focus on the physical development of the city. It also highlighted the tendency of municipal planning agencies to promote policies and plans that advanced elites interests at the expense of marginalized groups, including poor families, racial minorities, and immigrant communities. In addition, the article challenged the existence of a unitary public interest in light of the increasingly diverse nature of American cities. Davidoff concluded his article with an eloquent appeal to planners and planning agencies to work the leaders of marginalized groups to prepare high quality plans representing their interests. He argued that the development of multiple plans would provide planning commissions with new data analysis, alternative planning goals, and innovative policy recommendations that would improve the quality and fairness of planning decision-making.

Paul Davidoff’s persuasive arguments in favor of advocacy planning as an important tool for promoting more equitable and democratic cities created a small but significant movement within the planning profession. Young planners inspired by his work formed Planners for Equal Opportunity (PEO). For more than ten years this group challenged planning schools to diversify their faculty and study bodies. They also pressed major planning departments and commissions, under the leadership of Walter Thabit, to do the same. They also challenged Federal public housing, highway, and urban renewal policies which they believed were leading to further residential segregation that were restricting the economic opportunities of the poor. In the mid-1970s, PEO’s progressive planning activities, inspired in large part by Paul Davidoff, was taken over by a new organizations called Planners Network (PN) led by Chester Hartman which continues to promote advocacy planning values and methods through its electronic journal, national conferences, and regional issue forums on social justice and the city.

This paper argues for the greater relevance and importance of Paul Davidoff’s advocacy planning values and techniques in light of the increasing income, wealth, and power disparities; rising percentage of new immigrants, and recurring attacks against these communities in many of our nation’s largest metropolitan areas. This paper describes the important contribution that advocacy and, its related equity and insurgent forms, of progressive

planning are making to improving the quality and fairness of contemporary comprehensive, resiliency, and transportation efforts in several U.S. cities, including New York, Boston, and Chicago.

Research Approach/Methodology

This paper is based upon qualitative research methods featuring archival research, review of relevant theoretical and practice literature, analysis of Census Data, and interviews with planners involved in both historical and contemporary advocacy planning initiatives.

Findings

While never the dominant approach to planning practice, advocacy planning has historically and currently making significant contributions towards improving fairness and equity within public planning processes by highlighting the needs, aspirations, and desires of identity groups that are often overlooked or undervalued. This work has produced what William F. Whyte described as “social inventions for improving human problem-solving” designed to produce a more just city.

Relevance

Despite the passage of landmark Civil Rights legislation in the 1960s and 1970s aimed at expanding economic opportunity for low-income communities of color, social inequality continues as a defining characteristic of American cities. Advocacy planning seeks to change this reality through inspired forms of planning practice that are worthy of greater study and discussion.

MUNICIPAL PLANNING IN IMMIGRANT-FRIENDLY CITIES

Abstract ID: 162

Group Submission: Inclusivity & Rights: Creating an Urban Space for Immigrants & Refugees

HARWOOD, Anne [University of Illinois] sharwood@illinois.edu, presenting author

The academic literature focuses on how land-use decision-making processes become the platforms for anti-immigrant politics with very little about municipal planning in environments where immigrants are welcomed and supported. The growing literature on governing cities and immigrant integration focuses on such thing as education, language, economic development, policing, recreation and culture. While there is an emphasis on process and engaging immigrants in decision making, very little especially covers municipal planning, and even less so on regulations, such as zoning. Given this context, this project asks: How are municipal planners involved in welcoming and immigrant-friendly initiatives? How are municipal planners responding to immigrant-friendly political environments on an administrative level? Are the tools of municipal planners adjusting to immigrant populations? To answer these questions, I interviewed management level staff working in 30 different immigrant-

friendly cities for a total of 42 interviews, 23 were in planning departments and 19 in immigrant affairs offices. Additionally, I analyzed the content of 28 comprehensive plans and 17 immigrant integration plans. I found that while planners are aware of immigrants and many are experimenting with ways to better reach immigrants in the planning process, few explicitly talk about the immigrant population, and hardly any city is examining the laws and codes used to regulate land-use. At the same time, those focused on immigrant integration, know little about municipal planning, nor do they have much time to do it. The focus, while justified, are on immediate concerns about services delivery and social and economic integration. But built environment and land-use should also be considered, particularly the ways in which the regulatory structures and decision-making process shape integration.

PRE-ORGANIZED SESSION SUMMARY

SELLING OUT OR SELLING IN: ETHNIC AND RACIAL PLACEMAKING AND SPACES OF BELONGING (1)

Summary ID: 18

Abstract ID: 230

Abstract ID: 231

Abstract ID: 233

Abstract ID: 1290

These two sessions seek to develop a research agenda that better addresses the interaction of race and ethnicity with our understanding of place. We posit that the everyday practices found in ethnic and immigrant communities are key to understanding current conflicts over both economic and cultural gentrification processes, and can expand our repertoire of planning tactics and strategies. We seek to build an urban planning paradigm that centers the idea of belonging, particularly for communities of color, rather than older concepts of tolerance or inclusion. In particular, we bring to the fore the role of commerce as a form of placemaking. In many communities, a bookshop or restaurant might be a de facto cultural institution or business signage clusters might act as ethnic claims to space. Practical placemaking as found in grassroots community building, strip mall entrepreneurialism, and other culturally specific claims to urban space will be explored.

Objectives:

- Learning about the overlooked, everyday practices of a diverse set of ethnically and racially specific communities.
- Exploring an expanded notion of culture, resistance, and placemaking as found in ethnic communities.
- Considering the impacts and solutions to cultural, as opposed to economic, gentrification.

BEEN HERE: BLACK URBANISM AS THE CIVICS, STORIES, & SPACES OF BELONGING

MILLER, Matthew [University of Southern California] mattmill90@gmail.com, presenting author

Social sciences and humanities have proliferated largely deficit-driven views of the influence of race on American society (Hunter and Robinson, 2016), regularly concluding that American cities create places via “a politics of dis-belonging” (Bedoya, 2013). While merited, rarely do urbanists study how people of color forge modalities of urbanism geared toward belonging. This dexterous concept of belonging has received sustained interest in a variety of fields: geography (Antonsich, 2010, p.6-7), anthropology (Lovell 1998; Warriner 2007; Dragojlovic 2008), sociology (Kiely, Bechhofer et al. 2005; Bond 2006; Fox 2006; Scheibelhofer 2007), communications (Ball-Rokeach et al., 2001), American studies (hooks 1990). Yet, to date, no theoretical framework in urban planning exists to augment understanding and comprehensively observe how Black Americans generate spatial, economic, and sociocultural attachments to place. This study intervenes in that gap by dynamically studying Black commercial space.

Black-owned businesses (BOBs) provide a rich context to explore community and capital-driven questions (Sutton, 2010). Yet, much of the scholarship around BOBs frame them as absent (Fairlie, 1999), less financially successful, under-educated, and quicker-to-fail than their White and Asian counterparts (Robb and Fairlie 2007, 2008). Advocates have illustrated how the issues BOBs face are “runway problem[s]” rather pilot problems with the entrepreneurs themselves (Association for Enterprise Opportunity, 2017). However, without new theory, we cannot appropriately measure other realities nor change these realities.

Using a mixed-method, ethnographic case study of a commercial corridor in Los Angeles from 2016 to 2018, this paper argues for an asset-based theory of Black urbanism that reconstructs the value of space for how it emphasizes three forms of belonging: political (civic), cultural (stories), and socioeconomic (spaces). Each method in this paper corresponds to how a different form of Black urbanism and belonging can be observed.

- 1. Spatial belonging: Hot-spot analysis and cluster analysis of BOBs
- 2. Civic belonging: Content and archival analysis of public-private branding efforts
- 3. Cultural belonging: Digital and social ethnography of BOBs

Overall, it reframes BOBs as generative institutions that provide a trifecta of ways for Black Americans to claim space and seek belonging, though the road may be fraught with challenges. While Black placemaking has served as the next-of-kin concept (Hunter et al., 2010), placemaking is too narrow a process compared to the broader idea of urbanism. To date, the idea of ‘Black urbanism’ has been under-conceptualized by a few architectural, cultural, and urban professionals who have documented the unique ways Black Americans shape space (Zewde, 2010; Goodwin, 2010; Sass, 1994).

Ultimately, the paper concludes and reinforces a growing consensus that race is more than racism (Pitcher 2014; Hunter and Robinson, 2018). It can also paradoxically function as an ethnically-derived, asset-based tool for socially constructing cultural identities which have currency in the cultural economy.

"SOMOS AQUÍ": THE FIGHT FOR FAIR REDEVELOPMENT ALONG MARYLAND'S INTERNATIONAL CORRIDOR

Abstract ID: 231

Group Submission: Selling Out or Selling In: Ethnic and Racial Placemaking and Spaces of Belonging (1)

LUNG-AMAM, Willow [University of Maryland] lungamam@umd.edu, presenting author

Suburbia has always been a site of social struggle. While not well documented in the literature, it has served as an important space upon which marginalized groups have registered claims to equal rights, citizenship, and a more just distribution of resources. For much of the twentieth century, these battles were largely fought over access to housing, schools, jobs, and the promised suburban “good life.” But in the past few decades, the tenor of these debates has changed. With the unprecedented movement of minorities, immigrants, and the poor to the urban periphery, the battles now taking shape are about far more “urban” issues, like gentrification and displacement.

This paper explores the growing movement for equitable transit-oriented development within Langley Park, Maryland, a low-income, predominantly Latino immigrant community in the inner suburbs of the Washington, DC Metropolitan Area. The Purple Line, the region’s first inter-suburban light rail line, will soon pass through Langley Park, better connecting the neighborhood to opportunities around the region and potentially attracting much-needed investments. However, many fear that the Purple Line will result in higher land and property values that will displace current residents, small businesses, and the strong sense of community and culture that currently define the neighborhood. Through interviews with local activists, political leaders, and other stakeholders as well as analysis of secondary documents about the Purple Line, local plans, and organizing efforts, the paper shows how the neighborhood’s demographic and geographic context has shaped how equitable development has been pursued in Langley Park, and to what ends. This case study shows the challenges and opportunities for equitable development in diverse suburbs, offering lessons for community organizers and advocates, planners, and policy makers.

ETHNIC ENTREPRENEURSHIPS: CULTURAL RESILIENCY AND STRATEGIES FOR REURBANIZATION

Abstract ID: 233

Group Submission: Selling Out or Selling In: Ethnic and Racial Placemaking and Spaces of Belonging (1)

LARA, Jesus [The Ohio State University] lara.13@osu.edu, presenting author

The purpose of this presentation is to understand the factors that contribute to the establishment of Latino neighborhoods in urban areas, and to explore how these Latino communities contribute to the creation of social, economic, and cultural resilience for their residents. To address the research objectives, this presentation examines a series of commercial corridor case studies in different urban areas across the U.S. in order to learn

from best practices, and to draw out some lessons on cultural, social, and economic resilience among immigrant neighborhoods. These cases show public policy makers, academics, and business owners examples of how Latino communities can revitalize retail corridors and improve both the economy and quality of life. An overview of the steps that planners and policymakers can take include responding to an urban population's increasing diversity and changing demands, examining the processes and mechanisms that contribute to ethno-cultural alienation in Latino neighborhoods, and guaranteeing that any revitalization efforts in Latino communities will enhance local assets. Some prominent urban scholars argue that the idea of creating community via deterministic designs must be re-evaluated and that urban patterns of class, culture, race, and ethnicity should be part of the redevelopment of urban places (Marcuse 2000, Harvey 1997). The study areas are currently part of a transformation process resulting in areas with vibrant commercial centers, and these centers help maintain the social networks that provide ties to Latin American home countries while working to acclimate new immigrants. A detailed analysis of business activities and census data in the case studies illustrate changing spatial patterns and demonstrates how ethnic minority entrepreneurs are giving new meaning to such abandoned and dilapidated landscapes as strip malls and older, unmaintained neighborhoods. This presentation also investigates the specific ways in which urban spaces are being transformed and modified to suit the needs and cultural preferences of their residents.

Latino immigrants play an important role in shaping the built environment, and what that role implies for the future. Scholarship in Latino Urbanism is practiced across many disciplines, with scholars engaged in research from a variety of perspectives and geographic representations. Books such as *Latino Urbanism* (Diaz and Torres, 2012) *Diálogos: Placemaking in Latino Communities* (Rios and Vasquez 2012), *Barrio Urbanism* (Diaz 2005), *Hispanic Spaces, Latino Places: Community and Cultural Diversity in Contemporary America* (Arreola 2004), and *Latino Metropolis* (Valle and Torres 2000) all these provide a foundation for discussions about the future course of Latino Urbanism in the US.

BIG PLANS: COLLECTIVE ACTION FRAMES, REIMAGINING AND REBUILDING BLACK URBAN PLACES

Abstract ID: 1290

Group Submission: Selling Out or Selling In: Ethnic and Racial Placemaking and Spaces of Belonging (1)

SUTTON, Stacey [University of Illinois at Chicago] suttons@uic.edu, presenting author

A major concern among many urban planning, geography, and sociology scholars has been and remains how and in whose interest local areas, or communities, are produced and reproduced. In the contemporary moment, however, the issue of community formation is undoubtedly heavily influenced by decades of neoliberal policies and practices that have inhibited or rendered illogical, infeasible or radical more expansive visions for community building and development. Although the community development subfield, for instance, still encompasses inquiries into whose planning with whom, for whom, and to what end, decidedly political questions, and purports to correct for market distortions and mitigate the consequences of historic patterns of uneven private and public investment (Wolf-Powers 2014). The practice of community development has arguably narrowed to an emphasis on building partnerships with corporate capital, cultivating community assets, and bottom-line outcomes (DeFilippis et al. 2006).

In this article, I draw on community development and social-movement literatures to analyze the structure, actions and organizational ideologies of three organizations engaged in planning in Black communities in Chicago, Brooklyn and Jackson, MS. Using organizational documents such as annual reports, comprehensive plans, and flyers, I present a discourse analysis of the ways that organizations describe their goals and agenda. Moreover, I assess the extent to which these organizations engage in community development through “collective action frames,” which constitute a motivating discourse for building legitimacy by clearly identifying problems at the appropriate spatial scale, diagnosing their causes, proposing solutions, and giving reasons for collective action (Martin 2003). While the organizations in this study reject conventional approaches community development, they make strategic calculations about how best to enlist municipal support. The organizations in this study reveal how place informs activism and how sociospatial environments shape framing processes. Further, by inserting these organizations into collective action framing, this study offers a more expansive understanding of placemaking, namely as a critical space between community development and social movements/activism.

PRE-ORGANIZED SESSION SUMMARY

GROUP SUBMISSION: SELLING OUT OR SELLING IN: ETHNIC AND RACIAL PLACEMAKING AND SPACES OF BELONGING (2)

Summary ID: 19

Abstract ID: 234

Abstract ID: 236

Abstract ID: 237

Abstract ID: 246

Abstract ID: 1361

These two sessions seek to develop a research agenda that better addresses the interaction of race and ethnicity with our understanding of place. We posit that the everyday practices found in ethnic and immigrant communities are key to understanding current conflicts over both economic and cultural gentrification processes, and can expand our repertoire of planning tactics and strategies. We seek to build an urban planning paradigm that centers the idea of belonging, particularly for communities of color, rather than older concepts of tolerance or inclusion. In particular, we bring to the fore the role of commerce as a form of placemaking. In many communities, a bookshop or restaurant might be a de facto cultural institution or business signage clusters might act as ethnic claims to space. Practical placemaking as found in grassroots community building, strip mall entrepreneurialism, and other culturally specific claims to urban space will be explored.

Objectives:

- Learning about the overlooked, everyday practices of a diverse set of ethnically and racially specific communities.
- Exploring an expanded notion of culture, resistance, and placemaking as found in ethnic communities.
- Considering the impacts and solutions to cultural, as opposed to economic, gentrification.

HOW I LEARNED TO STOP WORRYING AND LOVE THE STRIP MALL: COMMERCIAL SPACES DESIGNED FOR AND BY IMMIGRANT ENTREPRENEURS

Abstract ID: 234

Group Submission: Selling Out or Selling In: Ethnic and Racial Placemaking and Spaces of Belonging (2)

CRISMAN, Jonathan [University of Southern California] crisman@usc.edu, presenting author

Strip malls have long been maligned as unattractive urban spaces which detract from their surroundings and signal car-oriented sprawl. Historically, they flourished during the 1970s and 80s when former gas stations were sold off as cheap street corner parcels, and saw a backlash during the 80s and 90s as cities tried to regulate their development out of existence. Now, however, they are seeing a resurgence in popularity as the availability of urban space is ever more limited and as hip restaurants and businesses locate off the beaten path (Linovski 2012). What is the role of these humble commercial spaces in the process of urban development and what are the material qualities that make them unique?

In particular, what is the relationship between race, ethnicity, immigrant life, and strip malls? Literatures around race, urbanism, and planning have often focused on housing and amenities, but what are the processes of racial inclusion and belonging driven by commercial development? Strip malls are often the site of mom and pop food establishments, nail salons, barber shops, and other ethnic and immigrant businesses (Loukaitou-Sideris 2002; Zhuang 2015). Is it possible that the backlash against their development was linked to negative racial attitudes, and their current improved reputation is related to changing demography? And what are the ethnically and culturally specific claims to space and forms of placemaking found in what are often seen as generic architectures?

This paper will delve into the history of strip malls in Los Angeles and evaluate their design qualities and code requirements which allowed them to flourish, decline, and thrive once again. Additionally, through analysis of historical rental cost data, spatial ethnographic research, and interviews with La Mancha, the largest single historical developer of such properties in Los Angeles, strip malls will be reclaimed as a site of critical importance for immigrant entrepreneurs and urban development at large.

ETHNICITY: MAPPING THE LINGUISTIC LANDSCAPE OF LOS ANGELES' ETHNIC COMMERCE

Abstract ID: 236

Group Submission: Selling Out or Selling In: Ethnic and Racial Placemaking and Spaces of Belonging (2)

KIM, Annette [University of Southern California] annettek@usc.edu, presenting author

The public sector has embarked on an open data revolution in our information age and governments around the country have made public data more easily accessible through the internet. Los Angeles city and county have not

only uploaded their datasets but also made the extra investment to spatialize the data into interactive maps through websites. This important and necessary first step investment has also made clearer some of the limitations of existing datasets. For example, the Office of Finance datasets of “active businesses” is outdated, retaining many records of non-existent businesses. Also, the conventional fields used to describe the businesses do not address some of the pressing policy questions of the day such as the uneven support and regulation of minority businesses.

Over the past two years, my research team has been testing and developing a process for generating new data about ethnic commerce in Los Angeles. We can fill a data gap that neither public databases nor private vendors currently provide by making creative use of publicly available imagery and synergizing it with other mapped data.

By ethnic commerce, we mean a specific phenomenon. In Los Angeles, businesses display signage in a variety of languages to communicate to their customers, despite occasional proposals to require English language signage that have regularly been struck down in courts. Through exploratory studies in which we interviewed store owners, we also found that the signage text not only describes their cultural products and services they are also sometimes chosen to express the cultural identity of the owner. So, LA’s shop signs can tell us about the ethnicity of the customer, the products, or the owner (not necessarily all three). In essence, the shops are literally speaking to us about ethnicity.

Google takes StreetView photos of the establishments along major streets in Los Angeles several times a year, providing the only timely record of what is happening on the ground as establishments, open, change, and close. Attached to these images is metadata about the coordinate location of the camera and the date.

We have developed a method to automate collection of these images, isolate the business’ signage in the image, convert it into text, recognize the language as well as interpret the text. With this novel database of images, text, location, and date, my group can also spatialize this data into maps which would allow us to identify locations, neighborhoods, clusters of business by a variety of attributes such as business type, ethnicity, etc. Furthermore, we can intersect the spatialized database with commercial real estate market data and census datasets so that we can analyze how rent prices and neighborhood demographics are associated with these ethnic commercial clusters.

We are collaborating with the city of Los Angeles’ Information Technology Agency for a new data map which would have more accurate and sustainably updatable information about businesses in the city as well as information with which to assess the potentially disproportionate impacts of the city’s outreach, compliance, and enforcement actions on minority businesses (Garcia, 2013). Similarly, the database behind our map integrates information that could analyze the potential impacts of economic development strategies on minority businesses. Furthermore, our map can contribute to the debates about the economic impacts of immigration by generating new visualizations and insights about the spatial patterns of ethnic commerce.

TAKE THE NEON LIGHTS AND MAKE A CROWN: THE SUBVERSIVE GEOGRAPHIES OF THE EVERYDAY

Abstract ID: 237

Group Submission: Selling Out or Selling In: Ethnic and Racial Placemaking and Spaces of Belonging (2)

BRAND, Anna [University of California, Berkeley] annalivia@berkeley.edu, presenting author

Claiborne Avenue is a “rebellious” (McKittrick 2016) space. It was the heart - the crown - of the black business and cultural community by the mid-20th century, until the construction of the I-10 expressway over the avenue’s median in 1968 decimated this once vibrant place. Since 1968, Claiborne has been both site and object of contrasting logics of development – from residents’ adaptations of the spaces under the bridge to proposals for other waves of clearance. This corridor is caught between worlds of contextual, everyday acts of belonging and modalities of clearance, inclusion or racial tolerance that stem from white spatial logics and epistemologies (Dwyer and Jones 2000).

The everyday business and cultural corridors in black mecca neighborhoods such as New Orleans’s Tremé were separate worlds from the overtly spatialized segregation of the early-mid 20th century. In these spaces, black Americans created a world apart from the brutalities of racialized inequality. These worlds were often created in spite of structural forces that shaped the political, social and spatial spheres unequally for blacks and within strict delineations of segregated color lines. Yet these worlds also subversively countered the implicit meanings of white supremacy as expressed through segregation by creating value in places and for bodies that were not valued. From banks to hair salons and barbershops to cafes and nighttime venues, the historic corridors that made up the pre-Civil Rights black urban sphere centered these worlds as subversive geographies that spatialized political agency and subaltern values.

These subversive spatial practices have continued along Claiborne and residents’ accumulated stories and visions for this corridor offer to urban planning other possible futures. From murals to inhabitation, from visioning to countering exclusive development visions, residents in and along this corridor project, re-member (Savoy 2015) what Claiborne was and is and therefore what it might be.

This research asks how the city simultaneously exhibits the impulse to remake space to aid colonial and/or plantation practices and to imagine a different geographical future that is not solely contoured by relationships with white supremacist spatial structures and practices of discrimination and dispossession. Centering Bates’ et al. (Forthcoming) challenge to map subversive black geographies that have been and are constructed through subaltern conceptualizations of space, temporality and development, this research re-presents subaltern geographical imaginations along one avenue in New Orleans.

Bringing together multiple methodologies, including archival research, site analysis, and interviews/spatial histories with residents, to unsettle the plantation trajectories (McKittrick, 2016) of this corridor’s history (Jones Allen, 2018), this research posits that the spatial memory of vibrant, rebellious spatial histories translates into concrete design visions for the future of this corridor and into tangible practices of resistance to white spatial logics (Dwyer and Jones, 2000) that operate through planning and design. Using the archival data and interviews, I highlight voice and acts of belonging across different temporalities along this corridor, collapsing these past and present epistemologies into future modalities and visions for more just settlement patterns and landscapes. I explore how residents’ visions conflict with a series of planning and design-led future projections and highlight the gaps between different spatial epistemologies and socially just design modalities. Finally, this research draws out the unmapped possibilities of place and anti-racist development, asking what a landscape of racial justice and reparations might look like.

WHERE COMMERCE MEETS CULTURE: IMMIGRANT SPACE AND SUBURBAN RETAIL IN THE NEW LATINO SOUTH

Abstract ID: 246

Group Submission: Selling Out or Selling In: Ethnic and Racial Placemaking and Spaces of Belonging (2)

ARROYO, John [University of Oregon] arroyojc@mit.edu, presenting author

While it may seem that traditional shopping malls are dying, immigrant communities are reviving distressed retail spaces. Nowhere is this phenomenon of adaptive use more acute than in small cities, towns, and unincorporated jurisdictions across the United States. In many of these sprawling metropolitan suburban and exurban areas, Great Recession-era commercial centers are often abandoned or forgotten (Dunham-Jones and Williamson 2011; Williamson 2013). At the same time, these outer suburban areas are becoming popular, affordable places for new immigrants and urban migrants to live, work, recreate, and shop. Over the past 20 years, Latina/os (Latinxs) are bypassing historic, urban ethnic enclaves to settle in suburban areas of the U.S. South – where the largest increase in the U.S. Latinx population has rapidly reshaped the built environment (Odem and Lacy 2009; Smith and Furuseth 2006). Along with these surging Latinx demographics come distinct sets of consumer and cultural preferences, plus a combined national buying power that exceeds \$1.5 trillion (Dávila 2016). Developers have capitalized on this by constructing generic Latinx-themed malls based on Colonial-era Latin American facades and streetscapes – with varying levels of success. How do Latinx immigrants reshape commercial centers in recent high-growth peripheral gateways in the U.S. South?

This paper relies on ethnographic research to discuss how Latinx (predominantly Mexican) tenants and developers have changed the interior and exterior retail characteristics of four Latinx-specific commercial centers in greater Atlanta: Plaza Fiesta (Chamblee, GA), Santa Fe Mall (Duluth, GA), Plaza Las Americas (Lilburn, GA), Plaza Latina (Norcross, GA – recently demolished per eminent domain). The study draws on the ethnic-specific placemaking ideals set forth by Latinx Urbanism scholars (Arreola 2004; Davis 2000; Diaz and Torres 2012; Lara 2018), as well as the normative spatial “fit” dimensions proposed by Kevin Lynch’s *Good City Form* (1981). The study analyzes how distinct physical elements symbolize more than mere consumerism. They serve to define a thriving “third space” and vital community anchor for cultural, social, and civic life in new immigrant destinations (Oldenburg 1989). Data are triangulated from nearly 150 in-depth interviews, participant observation, and longitudinal content analysis of local English and Spanish-language news outlets and municipal policy documents since 2000. Findings will contribute to urban design policy literature and migration studies by analyzing how Latinx shopping centers in the Nuevo (or New) South imbue a sense of empowerment and agency while establishing a key focal point for recent immigrants.

LIMINAL AND INTERSTITIAL CITIZENSHIP

Abstract ID: 1361

Group Submission: Selling Out or Selling In: Ethnic and Racial Placemaking and Spaces of Belonging (2)

SIMPSON, Sheryl-Ann [UC Davis] ssimpson@ucdavis.edu, presenting author

Citizenship is often understood as a formal status, something that one simply is, or is not. A more comprehensive understanding of citizenship, however, focuses on both formal and informal aspects, including the rights afforded by formal status, as well as the ability and opportunity to participate in the decision making processes of the polity, alongside full social and cultural membership and belonging. In this understanding becoming a citizen is no longer a binary state, something one is or is not. Instead there is an imperative to examine and understand the process of becoming a citizens, including intermediary stages of the process. Understanding this process of citizenship is important for both planning theory and practice because of the ways in which planners act as both local representatives of, and gatekeepers to, the state and decision-making processes more broadly. Further, place, and the production of place, play an important role as both context and content of practices of citizenship. Conditions in place shape opportunities for engagement, participation and membership, and spatial practices such as use, making claims, animating and caring in place are strategies for claiming citizenship. For these reasons there is a need for planning theory that specifically addresses the process of citizenship formation, the process of becoming a citizen, and the role of planning in that process.

This paper provides a theoretical examination of citizenship formation by drawing on empirical research in North America and northern Europe focused on the role of place in the processes of immigration, settlement and incorporation to build a stronger understanding of the intermediate stages of citizenship formation. Further the paper specifically discusses theories developing around practices of 'liminal and interstitial citizenship.' The liminal is a threshold, a gateway between one state and another. Passing through the threshold implies an openness to being changed by what is on the other side, but also the potential to make changes once you are there. While the interstitial is a state between and outside of familiar boundaries. Similarly liminal citizenship describes both practices of citizenship that happen in the transition zones between public and private space, and the process of moving between non-citizenship and citizenship. Interstitial citizenship is a somewhat contradictory term, which nevertheless, holds great utility within planning theory, referring to the spaces and practices of immigrant residents that involve engagement, use, care and claims to space, but that do not lead to citizenship. This interstitial state, might be caused by a refusal of membership on the part of immigrant residents, but is more likely to occur when an existing polity refuses entry, or refuses to be changed by the practices of these active residents. The paper further develops these concepts through a synthesis of data gathered from empirical studies examining the practices and narratives of immigrant residents in North America and northern Europe. The focus of these studies are primarily racialized immigrant communities, and actions within intimate environments such as front and back yards, apartment complex courtyards, streets, parks and neighborhoods. This research has included over 24 months of dedicated participant observation, formal interviews and participatory mapping exercises with immigrant residents, and community development professionals serving immigrant communities.

Finally, I argue that understanding and incorporating ideas around liminal and interstitial citizenship provides an important opportunity for planners to reflect on their own role in facilitating or blocking opportunities for membership. This might include the recognition of immigrant resident actions, and spatial practices as citizenship practices, and, importantly, a willingness to be changed by them.

PRE-ORGANIZED SESSION SUMMARY

TOWARD AN INTERSECTIONAL DISCOURSE ON INSURGENT PLANNING HERSTORIES

Summary ID: 48

Abstract ID: 1103

Abstract ID: 1104

Abstract ID: 1106

Abstract ID: 1109

Planning's decision-making disproportionately affects vulnerable populations, particularly communities of color. The field has recognized and sought the inclusion of persons of color in order to diversify the demographics of the profession, yet the individualized burden of tokenization does not substantively address the structural gaps between what planning's scholarly spaces preach in theory and the lived experiences in subaltern places. This panel centers intersectional planning herstories as a means to share radical insurgent planning herstories and counter dismissive hegemonic trends. Intersectionality attributes interpersonal, cultural and structural barriers as constraining the ability of women of color to be included as prominent interlocutors, to navigate graduate programs successfully, etc. In short, where are the planning stories of women of color? We argue the narrative turn in planning remains to be fully explored as a planning tool for fruitful insurgent, intersectional and intergenerational discourse on the general and the particular institutional challenges present.

Objectives:

- This session expands the metrics of planning narratives and centers the planning theories and practices of women as sites of both cultural and pedagogical production.

INTERSECTIONAL EXPERIENCES OF WOMEN OF COLOR AT ACSP MEMBER INSTITUTIONS

Abstract ID: 1103

Group Submission: Toward an Intersectional Discourse on Insurgent Planning Herstories

REDDEN, Tyeshia [Gettysburg College] tredden@ufl.edu, presenting author

Since the 1960s, urban planners have recognized that the field's decision-making disproportionately affects communities of color. Consequently, urban planning graduate programs have sought the inclusion of people of color in order to diversify both the demographics and ideological spectrum of the profession. Amid discussions regarding the urban planning field's difficulties in achieving representative populations at the 2017 Association of Collegiate Schools of Planning (ACSP) Annual Conference, some faculty have suggested that there is a lack of students from diverse backgrounds "in the pipeline." The intersection of race and gender poses a specific set of challenges for women of color in graduate programs. Commonly referred to as "intersectionality," both interpersonal and structural barriers constrain the ability of women of color to navigate graduate programs successfully. The cultural nuances, gatekeeper epistemology, and deficient mentorship opportunities at many campuses combine to create an academic landscape that is both foreign and hostile. This presentation focuses on the experiences of women of color attending or having recently graduated from urban planning programs at twenty ACSP member institutions. Using snowball sampling to conduct qualitative interviews, I document

personal accounts and analyze the responses with Moya Bailey's "misogynoir," racialized and gendered discrimination, as a theoretical framework. This work reveals the structural and cultural challenges that have delayed the field's progress in diversifying its ranks and threaten its future relevance in an ever changing demography.

PÒSALI'S PLANNING STORY: THE GENDER OF AID & NGO-IZATION OF DISASTER RELIEF

Abstract ID: 1104

Group Submission: Toward an Intersectional Discourse on Insurgent Planning Herstories

JOSEPH, Sophonie Milande [Columbia University] smj2140@columbia.edu, presenting author

Oral storytelling is at the heart of Haitian traditional knowledge exchange. Planning scholar, Leonie Sandercock notes that stories are also at the heart of planning practice and thus experts' knowledge exchange. In October 2016, Haiti's Southwestern Peninsula region was devastated by Hurricane Matthew, a category-five superstorm. Physical infrastructures' reconstruction is a difficult post-natural disaster challenge. Few insurgent planning herstories exist that bridge discourses across urbanisme's disciplinary and language barriers. The purpose of this case study is to tell rural infrastructure planning stories about the diffusion of traveling planning ideas, specifically decentralization planning within the Haitian postcolonial context. Decentralization planning is defined as the devolution of strong central governments responsibilities, functions or powers to a less concentrated area of subnational government units. The research questions the long-term sociocultural impact of the NGO-ization of development aid in disaster recovery efforts. This longitudinal and mixed methods case study of a rural municipality, Pòsali, tracks planning efforts from 2010 to 2017. By focusing on rural, Southern Haiti's pre- and post-disaster experience and NGOs' invasion of the area, I triangulate data from semi-structured interviews, quantitative survey responses, ethnography and historic archival documents' analysis. The research findings include: NGO invasion of an area decreases community members sense of unity, increases participation fatigue and thus decreases participatory planning's viability. Furthermore, decentralization planning goals are undermined by the complexity of the pernicious effects of aid. This intersectional study contributes to a gap in the Black diaspora's policy-making and urban history within the policy mobilities, transnational planning, radical geography and feminist planning literature.

SPECULATIVE CITIES: URBAN PLANNING FAILURES IN BLACK WOMEN'S FICTION

Abstract ID: 1106

Group Submission: Toward an Intersectional Discourse on Insurgent Planning Herstories

JACOBS, Fayola [Texas A&M University] fayolaj@gmail.com, presenting author

While initially appearing to be an incongruous juxtaposition, city planning and speculative fiction have similar threads running through them: both are forward looking pursuits that are based on some imagination of what space and place could or should look like. In this presentation, I argue that speculative fiction can provide a rich source of information about the historical influences, present reality and future possibilities of cities especially when the focus is on African diasporic communities as these communities have been silenced and/or erased through the violence of slavery, colonization and racism. Speculative fiction, even more so in the cases of communities under oppression, can be another source of how people view, understand and imagine cities. Pulling from feminist literary criticism and black geographies, I offer readings of Octavia Butler's *Parable of the Sower* and Nalo Hopkinson's *Brown Girl in the Ring* which make clear the ways that neoliberal, capitalist, planning regimes have failed Black communities and propose paths forward, rooted in reclaimed, reimagined and new community knowledges.

GENDER AND DIVERSITY IN THE PLANNING ACADEMY: 1980 TO 1995

Abstract ID: 1109

Group Submission: Toward an Intersectional Discourse on Insurgent Planning Herstories

GAUGER, Bri [University of Michigan] bgauger@umich.edu, presenting author

When women began entering the planning academy in large numbers in the 1970s, social movement pressure from inside and outside the discipline precipitated a shift in planning issues and scale. Feminist scholars were at the forefront of this charge to push the field towards equity frameworks through a critical assessment of gendered planning outcomes and by developing new epistemologies for planning (Ritzdorf 1995; Leavitt 1986; Milroy 1991; Parker 2012; Markusen 1980). In the 1980s and early 1990s, women institutionalized demands for equity in the planning academy by fostering professional development activities and mentorship programs and advocating to ACSP leadership through special interest groups and committees. This paper analyzes the institutional memory built during this period, framing a historical perspective as a way to understand and confront persistent institutional challenges for women of color in the planning academy. How did women influence institutional efforts for diversity, and to what ends? To answer these questions, I rely on a combination of personal, institutional, and intellectual perspectives gathered from interviews and archival sources. I collected oral histories from twenty women active in institutionalizing diversity efforts and support for women's careers in academic

planning organizations during the 1980s and 1990s. I augment these accounts with primary documents such as ACSP governing board meeting minutes, committee reports, personal correspondence, and documentation on the formation of special interest groups. Following Ahmed (2010) and Wiegman (2012), I inquire after the relationship between formal organizations of knowledge and the varying political commitments of several generations of planning scholars, examining how women's activism has shaped, and been shaped by, diversity efforts in the planning academy.

SOCIAL DYNAMICS IN DIVERSE NEIGHBORHOODS: IMMIGRATION, GENTRIFICATION, AND ETHNIC NEIGHBORHOOD

Abstract ID: 42

Individual Paper Submission

MATSUMOTO, Naka [Keio University] nakam227@gmail.com, presenting author

Background

Both statistical and empirical studies show the increase of diverse neighborhoods throughout the United States. The increasing immigrant population has clearly contributed to this transformation (Marrow, 2005). Immigrant settlement into not only traditional gateway cities like Chicago and Los Angeles but also old postindustrial cities has created diverse neighborhood throughout the United States (Singer, 2004). In those postindustrial cities, when the original immigrant influx ceased and younger generations made their exodus to suburbs, the cities suffered significant population loss and struggled economically. However, they are now seeing new immigrants, this time mostly from Latin and Asian countries. At the same time, those inner city areas are experiencing an influx of young professionals (Hwang, 2015). Those young professionals tend to be gentrifiers who see that the neighborhoods have attractive characteristics such as affordable housing, close proximity to entertainment and work, historic buildings, and an ethnic population that can provide them with authentic cultural experiences (Brown-Saracino, 2004). All together, these conditions generate demographically diverse neighborhoods. How we create an inclusive and collaborative living environment in such rapidly diversifying neighborhoods is an important question. As Sandercock (2000) stated, "... we do share the space on the planet with others who in many ways are not like us, and we need to find ways of co-existing in these spaces...." This paper investigates the social relationships in the neighborhood and the realistic measures that planners, community organizers, and city officials can take to build diverse yet inclusive communities.

Case and Methods

The main source of this paper is a survey conducted in Greektown in Baltimore City, Maryland, in 2015. Greektown was, as the name implies, once a Greek immigrant enclave and still maintains some original ethnic characteristics on the surface. Yet in the past ten years, it has become far more diverse from the rapid influx of Latino immigrants as well as young and professional residents, the majority of whom are White with high educational attainment. The three groups are ethnically, socioeconomically, and generationally different. Ninety-

six participants, including Greeks, Latinos, and young new residents, responded online or to a paper-based survey in English and Spanish. In addition, interviews and participant observations that were conducted from 2013 to 2015 add to the stories behind the survey.

Findings

The case in Greektown indicates that this ethnically and socioeconomically diverse neighborhood is physically integrated but socially fragmented with scarce interaction between the groups. It is easy to assume that the reason for this infrequent interaction may be due to the language barrier, lack of cultural understanding, and socioeconomic differences. Instead, the survey results find that those are not the main reason for the social fragmentation. The majority of residents in Greektown think that the language is not a major obstruction; rather, the lack of time to interact with the others is the primary explanation for the infrequent interaction. In other words, their daily lives are completed within their groups, and the necessity of communication with other groups is decreasing. However, this lack of close communication does not hinder coexistence in the neighborhood. In Greektown, the groups have positive perceptions of each other; for example, the Greeks see the Latinos as hard working and family oriented immigrants just like their grandparents; the Latinos see the Greeks as successful immigrants; and the young professionals see both the Greeks and Hispanics as giving an interesting and exotic flavor to the neighborhood, and they embrace the diversity. The paper highlights the importance of planners' understandings of such social dynamics in rapidly diversifying neighborhoods.

IMMIGRANTS AND RIGHT TO THE CITY: THE VISIBILITY OF BANGLADESHI STREET VENDORS IN ROME.

Abstract ID: 183

Individual Paper Submission

PIAZZONI, Maria Francesca [University of Southern California] mariafra@usc.edu, presenting author

Transnational migrations challenge conventional ideas of belonging. This paper analyzes how the urban visibility of the immigrant poor transforms the ways different people use and perceive space. I ask how planners can mobilize visibility to normalize pluralism in the public realm. The Bangladeshi street vendors who informally work in Rome's touristic center are the focus of my study. Through participant observation, interviews, and mapping, I explore the everyday interactions between the vendors, tourists, established residents, and police officers. I study these groups' behaviors and perceptions in a pedestrian-only area, and investigate how the visibility of the vendors affects their respective understanding of Rome. My findings demonstrate that the relationships among and within these users are at times conflictual and at other times strategic, or even convivial. Frictions arise because the vendors compete for the allocation of space, and because powerful actors (some local residents, the police, etc.) perceive the immigrants as outsiders who "pollute" Rome's identity. But the vendors' out-of-placeness and the particular form of the historic built environment also encourage civil inattention and friendly interactions.

When immigrants appear in a city, established groups perceive them as polluters of the local, pure identity (Douglass, 1966). For their part, stigmatized immigrants know that they are seen as “Others” and behave accordingly with people and in space (Goffman, 1963). Public space must serve as the arena where plural publics interact and learn to live together in difference (Sandercock, 2003). I study such encounters with difference by looking at when the ethnic “Other” appears in prime urban spaces. These areas, like Rome’s touristic center, epitomize local traditions conserving strong economic roles. When the immigrant poor occupy prime spaces, they encounter groups they would not usually meet—i.e. tourists and wealthy residents. This contact, visual and physical, makes it unavoidable for powerful groups to acknowledge difference while also enabling vulnerable subjects to construct a sense of urban belonging. Scholars of The Right to the City argue that everyday practices can challenge dominant patterns of exclusion (Purcell, 2002). I join this group of scholars and contend that the Bangladeshis’ visual encroachments function as collective, non-intentional tools of struggle for the right to the city.

Seeing and being seen in the city is the everyday tool the poorest can rely upon to ask for recognition. Scholars understand visibility as a political process that can advance the recognition of difference (Mirzoeff, 2011). Visibility’s political implications become apparent in touristic Rome, where the Bangladeshi’s presence sometimes triggers conflicts, but other times normalizes diversity in the eyes of the city’s users. I argue that planners should use the politics of visibility to encourage respect for the “Other” in the public realm. In support of this argument, I present visual narratives that challenge dominant assumptions of who belongs in touristic Rome. I propose to furnish the city center with urban elements that visually disrupt the crafted landscapes of heritage. I also distribute to the center’s users postcards with historic views of Rome that include today’s vendors next to their early-modern predecessors—predominantly Jewish “outsiders.” These postcards explain that street vending not only is constitutive of Rome’s heritage, but traditionally serves a vehicle of integration for marginalized populations.

LIVING IN LABOR CAMP: HOUSING CONDITIONS AND MENTAL HEALTH

Abstract ID: 200

Individual Paper Submission

HUR, Misun [East Carolina University] hurmi@ecu.edu, presenting author

ROCHA-PERALTA, Juvencio [The Association of Mexicans in North Carolina] juvenciorp@amexcannnc.org, co-author

DIDERICKSEN, Katharine [East Carolina University] didericksenk14@ecu.edu, co-author

Housing quality is positively correlated with psychological well-being of residents. Research found the relationship focusing on urban areas (Dunn & Hayes, 2000; Kearns & Smith, 1993), single-family detached versus multiple dwelling (Moore, 1974; Zalot & Webber, 1977), high-rise versus low-rise (Bagley, 1974; Evans, Wells, & Moch, 2003), and households with children (Hunt, 1990; Kasl et al., 1982). Yet, there has been only little interest in rural areas, especially looking at the migrant farmworkers' labor camps-temporary seasonal group dwellings (Vallejos et al., 2011). A few studies investigated private family housing for farmworkers (Early et al., 2006; Gentry et al., 2007). The rural housing for families is regulated by the U.S. Department of Housing and Urban Development (HUD) Minimum Property Standard for Housing (HUD, 1994; NRCAP, 2005). On the other hand, the labor camps in NC are regulated by the Migrant Housing Act (NC-MHA) (Arcury & Quandt, 2011). Although NC-MHA regulates bare minimum compared to the HUD's minimum property standard for

housing, the violations on the labor camps were notably reported (Arcury et al., 2012; Early et al., 2006), which we believe associated with adverse psychological health to farmworkers.

We ask two following research questions. Do the labor camp conditions affect farmworkers' mental health? If so, what characteristics of housing quality affect mental health, how and why? To understand the relationship comprehensively, we take into account other variables (i.e., social supports and community satisfaction) that might moderate the relation between housing and mental health.

Our data collection consists of a survey questionnaire and a field audit. The Farmworker Survey conducted in 2016-2017, assessed various social well-being and mental health for farmworkers in eastern North Carolina. The questionnaire includes the well-validated measures of depression (Patient Health Questionnaire, PHQ-9), anxiety (Generalized Anxiety Disorder, GAD-7), social supports (Multidimensional Scale of Perceived Social Support, MSPSS), and community quality of life indexes. In addition to the questionnaire survey, we also conducted an audit of physical conditions of labor camps. Evans, Wells, & Moch (2003) criticized the use of the subjective measure of housing conditions (asking residents how they evaluate the housing conditions). We adapted the Housing Audit instrument developed by Evans (2000) and recorded the labor camp conditions on cleanliness/clutter, indoor climatic conditions, privacy, hazards, structural quality, and housing and neighborhood/surrounding quality. Preliminary screening of the housing conditions began in 2016 and had continued until 2018. The sample of the research includes 12 labor campsites with H-2A migrant farmworkers. Total 300 farmworkers participated in the surveys. We anticipate showing the link between the inadequate living conditions to mental health problems to workers.

UN HABITAT's report, *The Right to Adequate Housing*, states "access to adequate housing can be a precondition for the enjoyment of several human rights, including the rights to work, health, social security, vote, privacy or education (p.9)." Every adult and child have the right to live in housing that does not compromise their health or well-being. Due to their lack of legal status, the criminalization of irregular migration in the US, work insecurity, and cultural/language barrier, farmworkers tolerate the poor housing conditions and lower quality of life. There might be different perspectives and new solutions around farmworker housing and health. A systematic approach with various stakeholders should be considered to address the problems.

THE IMPACT OF PRIVATIZATION ON DIVERSITY IN PUBLIC SPACE: EVIDENCE FROM DOWNTOWN DALLAS PARKS

Abstract ID: 282

Individual Paper Submission

GHAFFARI, Nazanin [University of Texas at Arlington-College of Architecture Planning and Public Affairs (CAPPA)] nazanin.ghaffari@uta.edu, presenting author

AREFI, Mahyar [University of Texas, Arlington] mahyar.arefi@uta.edu, co-author

This study focuses on how privatization of public space affects inclusiveness, diversity of the uses and users and thereby social justice. With the growing popularity of public-private partnerships, cities are heavily relying on the

market for financing, programming, and managing their public spaces. However, “public space” might rather be called “publicly-accessible” space, considering private ownership and control. Critics of privatization argue that privatized public spaces exclude individuals and groups based on race, gender, class, social status, and also beliefs, behavior, and activities (Davis, 2012; Loukaitou-Sideris and Banerjee, 1998; Mitchell, 2003; Schmidt and Nemeth, 2011).

To further explore this dilemma, three publicly used parks were selected in Downtown Dallas based on three ownership and management types: (1) publicly-owned, publicly-managed; (2) publicly-owned, privately-managed; (3) privately-owned, privately-managed. Exploring these spaces with different levels of private control helps evaluate their impacts on the degrees of inclusion not only based on gender, class and social status, but also accommodating protesters who claim spaces to show themselves as part of the “public.” Thus, we question privatization as a means of planning, programming, and designing the appropriate “public”.

Studies have examined exclusion in high-density, high-amenity cities of the east or west coast, e.g., New York, Los Angeles (Davis, 1992; Miller, 2007; Németh and Hollander, 2010; Peterson, 2006; Staeheli and Mitchell, 2007). However, the importance of inclusivity of public space has not been questioned in the sprawled, fragmented, low-density, auto-dependent Metropolitan areas, such as Dallas-Fort Worth. Hence, the study findings contribute to the literature, and help professionals to gain insights into the impacts of their interventions or decisions on the ground.

The research methodology includes (1) semi-structured interviews with three groups of stakeholders: community activists, management teams, and designers, representing the users, regulators, and developers respectively; (2) Participant observation during weekdays, weekends, formally-planned events as well as community-led ones, and (3) review of local media coverage as well as public spaces websites and social media (Instagram and Twitter) for content analysis. Triangulating the results from interviews, observations, and content analysis inform on how users, planners and administrators, and market appropriate public space for a win-win-win situation, so that all stakeholders feel included.

Based on the findings of participant observation and the content analysis of the three case studies' social media from March 2017 to March 2018: (1) The publicly-owned and managed space continues to restrict the use of space for “planned” events, granting access through payment or membership. Otherwise, the “homeless” and “local activists” claim the space for “unplanned” activities despite the presence of security; (2) “Social activists” and “protesters” are not allowed to engage the public in the publicly-owned and privately-managed case, where the private security severely restrict the presence of different types of “public.” However, women and children utilize the space for “planned,” and “unplanned” uses. Record of “homeless” people appearing within or outside of this park was not found during the observation; (3) “Social activists,” “protesters” and the “homeless” use the privately-owned and managed park heavily whereas women and children are routinely absent in the everyday life of the place.

Given the number, diversity, and types of activities and occupants, this research denies the relation of privatization to the geography of inclusion and exclusion. However, the presence of significant private control stimulates female occupancy.

VALUE-LADEN, NOT VALUE-FREE: BIG DATA APPLICATIONS AS TECHNOLOGIES FOR ETHNIC AND CLASS ERASURE

Abstract ID: 388

Individual Paper Submission

BUI, Matthew [USC] buim@usc.edu, presenting author

Today, in an increasingly unequal and digital society, the promise of technological, data-driven solutions for social issues is greatly common. The field of planning has not been immune to this rhetoric and touts open data, big data, and Smart City initiatives, among other techno-solutions, as the promising tools for an equitable, inclusive, and sustainable future. This paper, and its accompanying [interactive map](#) and [Story Map](#), are centrally concerned with the social and cultural implications of techno-neutral imaginaries in planning, and problematize the degree to which such digital and data-driven futures will be able to achieve desired outcomes, especially in relation to the empowerment of low-income communities of color.

This paper does not presuppose that “big data” and the “digital” are value-free and neutral, but instead argues that they are value-laden in their design, use, and deployment (Pinch & Bijker, 1984; Winner, 1986). Under the guise of technological neutrality, large data systems and applications often reinforce subordinate positionalities through their representations of marginalized groups and individuals, and contribute to the unconscionable withholding of resources from underrepresented communities, as a result of data-driven decision-making (Noble, 2018; Zook et al., 2017). Thus, as big data tools are increasingly integrated into community planning processes – and as our mediated environments now directly impact our built environments – it is of utmost importance to interject these notions of the social construction of technology alongside writings on spatial justice and the social production of space (e.g., Soja, 2010; Lefebvre, 1981) to understand the opportunities and dangers of big data tools for planning. Thus:

RQ1: Which groups and communities serve to benefit from “neutral” big data applications in planning?

RQ2: Which groups and communities are endangered?

To explore these questions, this study tests the validity of urban myths claiming artisanal coffee shops as purveyors of gentrification and ethnic erasure within Los Angeles, using Yelp as a case study for examining the politics of big data and a potential “alternative” dataset for land use planning. Business data for coffee shops in the City of LA were collected through the Yelp API and then coded according to their artisanal shop status, using menu items to inform categorization. Following this, the point-level data were overlaid on top of an extant gentrification index (Zuk & Chapple, 2015) and spatially joined to census tract data for visual analyses and socio-spatial regression tests.

The preliminary results indicate that artisanal coffee shops tend to agglomerate within gentrified and gentrifying neighborhoods, rather than non-gentrified neighborhoods, regardless of neighborhood socioeconomic status. Moreover, the shops with the highest ratings and review counts tend to be located within gentrified and gentrifying neighborhoods. Although we cannot directly attribute these results to the same causes and/or infer directionality, taking into consideration the overrepresentation of educated whites in Yelp user demographics, and the work of big data scholars such as Noble (2018) and Zook et al. (2017), we would be remiss not to be wary of techno-neutral narratives that portray any and all big data applications as equalizing tools for communities and removed from extant power relations.

Therefore, through problematizing narratives of techno-neutrality and exploring the ways in which social hierarchies are indeed embedded in the production and consumption of big data and geospatial platforms such as Yelp, this paper illustrates the potential failures of narratives promoting open data, big data, and social media applications as facilitators of spatial justice and community empowerment in planning processes. This paper redirects such techno-interventions to further interrogate and carefully consider the social aspects of socio-technical interventions, rather than overemphasizing the technical or otherwise endanger marginalized low-income communities of color even more through planning processes.

CARTOGRAPHIES OF ACCESS, OPPORTUNITY, AND DIFFERENCE

Abstract ID: 503

Individual Paper Submission

MEISTERLIN, Leah [Columbia University] lmm2132@columbia.edu, presenting author

Person-centric approaches for describing access to urban resources have developed over decades, largely reliant upon individual travel diaries and other survey-based data collection methods. Still, urban planning research and practice most frequently deploy cartographically standardized measures of accessibility when proposing interventions or evaluating landscapes of equity within cities. These measures unfortunately flatten documented, experiential difference between collocated individuals (differences often related to gender, race, and income levels) in favor of mapping a location-based, comprehensive image of the city via less resource-intensive data collection. Drawing from qualitative and feminist GIS, time-geographic techniques, and structuration theory, and while leveraging large, authoritative, and publicly available data sources, the paper presents countercartographies that reconfigure urban access as a variable landscape of opportunity and constraint incorporating, both, where we are and the lives we live there. Developing robust GIS-based, data-driven, and replicable approaches, the research focuses on spatiostructural differences between genders, presents an alternative cartographic conceptualization for describing and planning access to everyday locations in several mid-sized US cities, and reveals substantial variation in daily opportunities despite residential collocation. In addition to new methods for evaluation, the results offer insights into transportation and land use planning with additional implications for the development of gender-biased industry clustering (such as that found within the STEM fields).

UTILIZING COMMUNITY PLANNING AND COLLABORATION TO CREATE AGE-FRIENDLY COMMUNITIES FOR LESBIAN, GAY, BISEXUAL, AND TRANSGENDER OLDER ADULTS

Abstract ID: 547

Individual Paper Submission

RANAHAN, Molly [University at Buffalo, SUNY] ranahan@buffalo.edu, presenting author

Problem/Central Theme: Lesbian, gay, bisexual, and transgender (LGBT) older adults face unique challenges that influence health outcomes and social inclusion in community life. Despite the anticipated growth of this population and changing social and political attitudes towards sexual and gender variant communities, the needs of LGBT older adults are often not adequately addressed by agencies and organizations intended to support older people and often remain overlooked by many states and municipalities.

The concept of age-friendly communities exemplifies a new framework for policy and program development that accounts for diversity among both older persons and places they live. However, to date, planning and gerontological literature about age-friendly initiatives has not examined the capacity of this movement to be responsive to LGBT older adults

Approach and methodology: To address this knowledge gap, the current study examined the extent to which the development and implementation of an age-friendly initiative in Erie County, NY addressed the needs of the LGBT community.

The study answered the following research questions:

- What innovative community planning and collaboration practices have been integrated as part of age-friendly efforts in Erie County, NY to address the needs of LGBT older adults?
- Where is there congruence and divergence about the needs of LGBT adults between policymakers, organizations that serve older adults, and members of the LGBT community in Erie County, NY?

To address these research questions, the study employed a descriptive, cross-sectional case study design to examine planning efforts in the real-life context of a county policy environment. The study utilized multiple data gathering techniques to obtain a rich depiction of the planning and implementation of county-scale efforts to improve outreach and support to LGBT older citizens. Data collection include: (a) interviews with multiple stakeholder groups (e.g., LGBT older adults, local and organizations, and public officials and policymakers), (b) participant observation of planning meetings, public hearings, and program events, and (c) gathering policies, program documents, and media coverage for content analysis.

The process for analyzing data interview data, observational field notes, and secondary policy and program documents included (1) open coding of all raw data, (2) focused coding of open codes, and emerging analytic concepts across and within the data set to develop thematic categories and subcategories, and (3) diagramming to explore the relationship of codes and conceptual categories.

Findings and relevance to scholarship/ practice: Study results depict the capacity of age-friendly initiatives to establish opportunities synergy and collaboration among government agencies and local organizations to address diverse needs of LGBT older adults. While awareness of needs vary among institutional leaders, a majority of the government agencies, senior centers, churches, and LGBT organizations had had intentional strategies in place to reach LGBT seniors in the community. Innovative practices identified include leadership-initiated outreach, collaboration for problem solving, and the utilization of existing funds and programs to create small-scale changes in policies and services.

These have important implications for planning scholarship and practice due to growth and diversification of the aging population and movement towards community-scale aging solutions. Study findings offer guidance to researchers, planners, and public-sector practitioners for addressing the needs of LGBT older adults as part of research and assessment efforts, decision-making, program development, and public engagement. Additionally, this study introduces new substantive issues to the growing body of literature focused on the implications of planning theory, research, and practice for LGBT communities.

THE GENDERED PRODUCTION OF INFRASTRUCTURE

Abstract ID: 619

Individual Paper Submission

SIEMIATYCKI, Matti [University of Toronto] siemiatycki@geog.utoronto.ca, presenting author

ENRIGHT, Theresa [University of Toronto] theresa.enright@utoronto.ca, co-author

VALVERDE, Mariana [University of Toronto] m.valverde@utoronto.ca, co-author

Over the years, studies have highlighted how women, the poor, racial minorities, and marginalized communities have the worst access to critical infrastructure services, and disproportionately bear the negative consequences from noxious public works projects built in their communities (Lucas, 2004, Pulido 2000). This paper examines the ways that unequal gender dynamics are a key feature of the front-end production of infrastructure, a topic that has received far less attention, yet significantly impacts on the projects that are built. Through a review and synthesis of a multi-disciplinary literature, the paper explores how the infrastructure sector is constituted, and identifies what actors and forces are essential in its making. Then an examination is carried out of the key project leaders, planners, builders, community groups and the symbolic narratives that together create infrastructure projects globally. The research shows how the gendered rationalities of mainstream infrastructure planning rely overwhelmingly on masculine norms and values. Masculinity is deeply embedded in the organizational structures, employment practices, symbolic meanings, aesthetic choices, and systems of power that create the vast arrays of infrastructure worldwide. And the paper reveals the ramifications of an infrastructure sector where the positions of power are overwhelmingly held by men, in an industry that has a legacy of racial discrimination that remains entrenched through to the present. Highlighting the pervasiveness of gender and racial inequity in infrastructure production has the potential to identify more just orientations for planning practices (Sandercock and Forsyth, 1992; Fainstein and Servon, 2005). The paper concludes by reflecting on what the gendering of infrastructure production tells us about the built environment and about the possibilities for building infrastructure differently.

LIMITS OF LOCAL DEMOCRACY: MUNICIPAL BOUNDARY CHANGES AND RACIAL DISCRIMINATION AFTER THE VOTING RIGHTS ACT

Abstract ID: 753

Individual Paper Submission

DURST, Noah [Michigan State University] noahdurst@gmail.com, presenting author

Cities in the United States routinely expand their jurisdictional borders through the process known as municipal annexation and, as they do so, they sometimes exclude neighborhoods with high shares of racial or ethnic minorities, a process known as municipal underbounding (Aiken, 1987; Anderson, 2010; Durst, 2014; Lichter, Parisi, Grice, & Taquino, 2007). These discriminatory patterns of exclusion are exacerbated by state laws that provide city residents with control over annexation decisions, either through public hearings or municipal referenda (Durst, 2018). Although racial underbounding has historically been prohibited under Section 5 of the Voting Rights Act (VRA), the Supreme Court's recent invalidation in 2013 of Section 4 of the VRA has led to a nascent return to municipal underbounding. In this study, a Geographic Information System containing Place and Block data from the U.S. Census Bureau is used to identify changes in city boundaries between 2010 to 2017 – before and after invalidation Section 4 of the VRA. “Difference-in-differences” regression analysis is then used to examine whether the share of whites, blacks, and Hispanics in annexed census blocks changed after 2013. The analysis illustrates that the invalidation of Section 4 has led the underbounding of black neighborhoods located on the fringe of cities; such patterns of exclusion are most pronounced in states that allow popular determination of municipal annexation (i.e., where city residents vote directly for or against annexation). This study highlights the need for planners to reconsider the importance of democratic institutions, local boundary changes, and social equity in the absence of federal oversight and enforcement of voting rights.

“MANAGING” DIFFERENCE IN ORGANIZATIONAL CONTEXTS: USING MULTIPLE IDENTITIES IN AN ASIAN AMERICAN ADVOCACY AND SOCIAL SERVICES ORGANIZATION

Abstract ID: 780

Individual Paper Submission

KWON, Haegi [Massachusetts Institute of Technology] haegi@mit.edu, presenting author

In 2017, immigrants and their children accounted for 27 percent of the total US population (Current Population Survey). These demographic trends have translated to social, political, economic, and physical change in various neighborhoods throughout the US, giving rise to “new immigrant gateways” as well as transforming traditional gateways for immigrant groups (Singer 2004). Consequently, policy makers and planners increasingly consider how to plan for ethnically and racially diverse communities (Sandercock 2000).

Nonprofit social service and advocacy organizations are increasingly viewed as key political players that work with constituents, policy makers, and other stakeholders to facilitate immigrants' social and political incorporation (Bloemraad 2006). Such organizations may serve, educate, advocate on behalf of, and politically mobilize some of the most disadvantaged portions of the US population – those who are undocumented, lack English proficiency, and are poor (Wong 2006). Through these activities, nonprofits may also shape stakeholders' understandings of immigrant communities and their needs at the local and national levels.

But how do immigrant advocacy and social service organizations claim to serve and work on behalf of a diverse constituency? In other words, how do they “manage” internal diversity (as individuals may identify along multiple dimensions such as ethnicity, race, religion, gender, geographic locale, etc.) given their diverse and at times, growing constituencies? My paper will focus on how staff in immigrant nonprofit advocacy organizations construct organizational identities and how these processes contribute to their advocacy activities, if at all.

Using data from a larger qualitative comparative case study of Asian American advocacy and social services organizations in New York City, I present findings based on 16 semi-structured interviews from my fieldwork in 2016. I use the example of Asian Americans because of the group's tremendous diversity which contributes to significant intragroup disparity and potential difficulties for advocates who seek to serve, mobilize, and represent a constituency comprised of individuals with dynamic identities. Further, Asian Americans represent the largest growing racial group in the US with the highest percentage of foreign born members among immigrant groups, rendering many to be excluded, by default, from traditional forms of political participation.

I focus on organizational initiatives (nail salon campaign, civic engagement, and DREAMer organizing) carried out by one Asian American social services and advocacy organization to demonstrate how organizations may strategically expand their social and ethnic boundaries, allowing advocates to juggle different identities (e.g. disadvantaged Korean, middle-class Korean, Asian American, and immigrant) in various advocacy and organizing contexts. Ultimately, these practices offer 1) a level of flexibility for advocates as they serve and advocate for multiple constituencies and 2) benefits in the form of increased funding opportunities and exposure to other stakeholders. However, these strategies may lead to unequal representation and service provision for constituents and/or clients who are intersectionally disadvantaged (Crenshaw 1991).

INTER-FAITH COALITIONS FOR IMMIGRANT RIGHTS IN NORTHERN ALABAMA

Abstract ID: 798

Individual Paper Submission

ERICKSON, Emily [Alabama A&M University] Emilyerickson@gmail.com, presenting author

U.S. Americans have long expressed a preference for taking membership in associations, organizations, and community groups that fall outside the realm of formal government structures. De Tocqueville argued that this tendency for associational affiliation is what led to a robust American Democracy. However, as we move into the 21st century, social theorists increasingly express concern about American's declining participation, and indeed interest, in community activities and associations (see Putnam 2001). The decline of such social interaction, or

social capital, indicates some key challenges to our democratic institutions. At the same time, the government has retrenched, cutting back on programs, services, and activities designed to support communities, especially those in need as neoliberal policies continue to guide all major political parties (Wolff 2001b). In this environment of reduced social capital and reduced government involvement, how to communities come together to create progressive change?

This question becomes critical when considering the needs and demands of communities lacking formal political voice and holding little political power. Undocumented Americans, are one such group. This project seeks to understand how community coalitions are formed and function in support of immigrant rights, immigrant access to social services, and the general welfare of immigrant communities in Northern Alabama.

Alabama has long experienced state retrenchment under neoliberal practices and relies heavily on faith groups to fill the gaps left by the limited state-sponsored social program. In Northern Alabama religious and community organizations have joined together in inter-faith coalitions to fill the gaps left by the state by providing social services to the public. After the 2016 election of President Trump, community coalitions took on increased significance as Americans desiring to push back against his race-baiting and nativist agenda, came together to demand political action. Immigrant rights organizers and leaders feared the future of their communities under a president that referred to Mexican immigrants as “rapists and murders” (Tobar 2016). While this level of racial division and government retrenchment was new for the Nation, it was not new for the State of Alabama where racialized violence and hyper nativist policies had long been at home. Indeed, it was as though the social policies of Alabama were taking over the national scene; news media declared “the Alabamification of America” (Pendigrass 2017). With this alleged Alabamification of the nation, it becomes increasingly significant to understand how community coalitions struggling for social justice have survived and even thrived here in Alabama. For it is not only the negative side of Alabama politics that can be exported to the rest of the country, but the organizing strategies, successes, and practices too.

To understand how immigrant rights coalitions function in Northern Alabama, this paper presents preliminary findings from a mixed-methods study of inter-faith coalitions. Two sets of data are analyzed (1) a social network analysis based on publically available data (web-scraping) of coalitions and organizations in the region and (2) a survey of organizations and faith groups working to further the cause of immigrant and undocumented Americans in Alabama. The social network analysis is undertaken to identify the centrality of organizations, relative levels of prestige, and key clusters of organizations. The survey is undertaken to gauge the importance of collaboration and coalition work to individual organizations and their efforts to further immigrant causes in the region. Findings from both of these approaches will speak to the function of coalitions for immigrant rights and the motivations for participating in immigrant rights activities.

SITUATING PUBLIC EDUCATION IN THE RACIALLY JUST CITY: THE CASE OF SCHOOL CLOSURE, DISPOSITION, AND REDEVELOPMENT IN PHILADELPHIA

Abstract ID: 812

Individual Paper Submission

Fainstein's *The Just City* outlines a way to "provide an evaluative standard by which to judge urban policies and to express the goals of urban movements" (2010, p. 36). The scale of the city (as distinct from a region or state) is useful because of the instrumentality of the local level of governance; "objects of investment" and "locational decisions" are under the purview of local governments (Fainstein, 2010, p. 7). Cities thus hold "the power to distribute benefits and cause harm," and in the just city, the distribution of "benefits and costs [goes] to those least well-off or those most directly and adversely affected" by public decisions (Fainstein, 2010, p. 9). The framework also responds to the turn towards neoliberal urban governance that relies on market-logics and outsourcing policy implementation to private actors, and on the preoccupation of urban policy with economic growth.

Notably, Fainstein omits public education in her conceptualization, commenting that "education is a crucial aspect of policy to be considered under the rubric of the just city [but it] require[s] separate and fuller examinations that I can provide here" (Fainstein, 2010, p. 7). Herein, I begin that examination by looking at school closure, building disposition, and redevelopment. What is the path to the just city for communities whose schools have been closed and sold for redevelopment? More specifically, what does the racially just city look like for these communities?

Considering schools as sites of redevelopment that are embedded in the dynamics of neighborhood change facilitates reflection on the ways that the politics of place and those of education interact in the context of racial justice. Specifically, I look at the case of Philadelphia, where in 2013, school district leaders closed ten percent of its traditional public schools, with the intention of selling the majority of these buildings. Nationwide, closures disproportionately and negatively affected students of color, and in Philadelphia neighborhoods with majority African American residents were more likely to experience school closures (Good, 2017). This exploration relies on findings from a study of the Philadelphia case conducted between March 2014 and August 2015 (with additional follow up research through December 2017). The original study included seven months of on-site ethnographic fieldwork; archival research and document analysis; and interviews with over 100 Philadelphia residents, city and school district staff, and other non-profit professionals.

The case of closed school buildings is a fruitful starting point and extension for Fainstein's framework to consider public education and racial equity. Their disposition and reuse highlight schools as physical infrastructure and sites of redevelopment that are embedded in the dynamics of neighborhood change. Fainstein's attention to local government extends easily to school districts, especially in places with contiguous city-school district boundaries and districts that operate under mayoral control or hybrid models that blur the lines between urban redevelopment and public education efforts. School facilities decisions (e.g., siting and constructing of new schools, rehabilitating older school buildings, school attendance zone design and implementation, and closing of schools) have historically (and today) unevenly distribute benefits and harm, cementing disadvantage for low-income communities and especially African American communities.

In this paper, I grapple with applying Fainstein's just city framework to public education and extend it by building on Fay's (2015) recent work that identifies school closure decision-making processes as an expression of "abnormal justice" (Fraser, 2008), and exploring the extent to which anti-racist policy and planning could move planners towards the racially just city (Kendi, 2016).

DIFFERENTIATING PARTICIPATION: EXPLORING THE RELATION BETWEEN PARTICIPANTS' CIVIC CAPACITIES AND THE DESIGN OF PARTICIPATORY SPACES

Abstract ID: 901

Individual Paper Submission

MELENDEZ, Jose W. [University of Illinois at Chicago] jwmuic@gmail.com, presenting author
MARTINEZ-COSIO, Maria [The University of Texas Arlington] mcosio@uta.edu, co-author

One of the challenges of participatory planning is ensuring that all participants are fully informed so that they can engage meaningfully in a context often offset by an imbalance of power and resources (Santos & Chess, 2003). This is one of the reasons why multiple researchers have constructed hierarchical schemes to assess the degree of shared power and responsibility as individuals engage in participatory processes (Arnstein, 1969; Cornwall, 2008; White, 1996). Such models aim to provide insight about the public's degree of access to meaningful power that can effect change from the bottom up rather than respond to predefined outcomes from the top down. While an upcoming special issue for JAPA argues that public engagement has "now been elevated over time to core values in planning practice," (2018) these practices can vary. They can vary not only in their level and type of engagement, but also in how they represent the value that those in charge of participatory planning activities place in the challenging work of including under-represented communities, usually absent from decision-making processes.

Drawing on three years of data collection, this study investigated participants' civic capacities –the skills needed to actively engage in civic discourse – and the role these capacities had in a participator budgeting process in Chicago. Discourse analysis of participants' social interactions from video data revealed key civic capacities that varied depending on the different design environments in which participants engaged. Civic capacities were found to have qualities at both the individual and collective level. Individual-level civic capacities were required for initiating ideas and clarifying the purpose of both the planning process and emerging ideas. However, individual-level civic capacities were not enough for ideas to become actionable. Collective-level civic capacities were necessary for an idea to be developed as a joint activity among participants, increasing the likelihood of the idea becoming actionable.

Accordingly, the study examined what contributed to the differences in the above findings, exploring design features that supported or inhibited the organization of civic capacities into individual or collective levels. The authors identify the difference between levels through coalescence- finding the commonalities in instances where ideas were only proposed against those developed into projects. As such, the study details how when coalescing happens, even individual-level civic capacities take on collective-level properties that support idea development across participants.

The above findings are instrumental given the diversity of participants in the participatory budgeting process under study. By differentiating between predominantly Spanish-speaking Latino immigrants and predominantly English-speaking participants, the study highlights how design features can limit or support participation across groups with different access to power and resources. Differentiating between the two types of civic capacities is critical for understanding the extent to which design features in civic spaces support or prevent the emergence of civic capacities. It is challenging to learn and develop collective-level civic capacities when participants who speak different languages attempt to engage in meetings that fail to support the differentiated needs of participants. Taking into account differentiated needs for participation is what the authors refer to as designing for equity (Meléndez & Martinez-Cosio, 2018). Planners should be interested in understanding the purpose of each type of civic capacity and how to design for their development (Forester, 2013), in particular how to design for supporting the level of participation at the top of participatory hierarchical schemes. Torfing and Sørensen argue in Healey et al., 2008, that we need to "focus much more on the role of institutional design for augmenting the size, quality and impact of participation", (p. 395) if we are to connect civic engagement and participatory planning for urban resurgence.

A GENDER LENS TO CREATIVE PLACEMAKING

Abstract ID: 913

Individual Paper Submission

FRISCH, Michael [University of Missouri-Kansas City] frischm@umkc.edu, presenting author

Creative placemaking has become an important tool for urban planners engaged in revitalizing cities. When effective, creative placemaking transforms a commodified space into a place reflective of lived culture. The full range of creative placemaking includes a variety of planning practices such as tactical urbanism, venue development, arts district designation, and constructing new live/work spaces for artists. While increasing support for large institutions such as museums and performing arts centers may play a role, effective creative placemaking facilitates the creative practice of artists

The occupational approach to creative placemaking quickly reveals an underlying reality: there are large gender discrepancies within artistic and creative occupations. Gender differences in creative fields exist in terms of employment, income, recognition and representation. Given these differences, what are the differential needs of artists and creative workers in terms of the built environment and social connections for success? How might creative placemaking work to increase equity of arts opportunities across these gender divides?

I use two major sources of data to answer these questions. I examine gender differences in artistic and creative occupations and activities using data from national surveys of time usage, occupational employment and wages, and census information. These data will set the context for a closer examination of gender differences in artists' practice. The second source of data is a local survey of artists from the Kansas City Metropolitan Area. This survey was designed to examine the needs of artists in the built environment and to examine the influence of institutional artist support networks. These data will be analyzed to illustrate underlying patterns of gender difference in artist and creative worker needs.

I find distinct gender differences in artist social networks, occupations, modes of recognition and income sources. This gender lens shows that the majority of artists and creatives in Kansas City who may benefit from creative placemaking may not directly show up in the occupational accounting. Furthermore, creative placemaking programs that address the needs of artists have the potential to increase gender equity and access. Provision of community art spaces and artist live/work housing development address some of the needs found in the artist survey. These spaces provide amenities that create stronger communities of place.

THE INFLUENCE OF MICROAGGRESSION ON MUSLIM WOMEN'S WALKING BEHAVIOR

Abstract ID: 932

Individual Paper Submission

MOHEBBI, Mehri [University of Cincinnati & Planning Communities] mohebbmi@mail.uc.edu, presenting author

CHIFOS, Carla [University of Cincinnati] carla.chifos@uc.edu, co-author

LINDERS, Annulla [Dept. of Sociology, University of Cincinnati] annnulla.linders@uc.edu, co-author

PALAZZO, Danilo [University of Cincinnati] danilo.palazzo@uc.edu, co-author

During the last two decades, emphasis on social components of walking behavior has created an emerging discussion in walkability discourse. The socioecological model of walking behavior is one the models, which determines social factors impacting walking behavior. This model discusses life-cycle circumstances at individual, group, and regional level, which impact one's decision to walk or not walk in an urban neighborhood (Alfonso 2005; see also Mehta 2008). The present research study explores social components of urban accessibility and the influence of those factors on walking behavior of a culturally cohesive disfranchised group, Muslim women, in Detroit Metro Area. This research determines whether higher level of walkability in an urban neighborhood encourages walking for Muslim women or social factors impact Muslim women's walking behavior more effectively than built environment components. The socioecological model of walking behavior introduced by Alfonso was used to determine the impact of Muslim women's life-cycle circumstances at individual and group level.

Detroit Metro Area hosting one of the highest concentration of Muslims in the U.S. is a good study area for the present research. This area also represents one of the most diverse Muslim communities within urban America due to their countries of origin, religious affiliations, language skills, and years of living in the U.S. This considerable diversity among Muslims in the area provided us with an insightful perspective on Muslim's cultural values and the roles those values play in Muslim women's social life experiences. The present research tends to answer three questions of (1) does fear of others (non-Muslims) diminish Muslim women's presence in studied public spaces (e.g. walking trails and sidewalks), (2) would living in urban neighborhoods with the majority of Muslims as residents promote Muslim women's walking behavior, and (3) what kind of barriers do community planners face to engage Muslim women in planning processes. This paper presents the outcomes of a qualitative research conducted from early 2013 to late 2016 to answer those three questions. A set of research activities were completed in this period from several participants observations in walking trails and urban parks, to semi-structured interviews with 122 Muslim women as participants.

This study revealed that four factors impactfully influence interviewed Muslim women's walking behavior: 1) fear of otherness, 2) social acceptance within Muslim community, 3) cultural differences with non-Muslims, and 4) built environment components. Fear of otherness was the most impactful factor mentioned by study participants, which includes sub-factors such as micro-aggression. Microaggression has long been mentioned as an impactful factor influencing urban population's social experiences (Wing Sue 2010). This paper introduces a model for walking behavior based on interviewed Muslim women's experiences, highlighting the phenomenon of microaggression and its overarching impact on Muslim women's social lives in Detroit Metro Area. Results of

this research will also provide community planning experts with the knowledge they need to communicate with this minority group and provides a new lens through which urban planners could see Muslim minorities' priorities and limitations related to their level of urban accessibility.

WHERE ARE THE WOMEN IN INDIA'S SMART CITY TRANSPORT PLANS?

Abstract ID: 987

Individual Paper Submission

SINGH, Seema [Cornell University] ss3625@cornell.edu, presenting author

Gendered differences in travel are now well established. It is well understood that urban transport plans and policies have a wide range of impacts, trade-offs and conflicts that affect men and women differently. This paper aims to address two inter related questions with the intent of better understanding and addressing the gender blindness of urban transport policies and plans in India. The specific questions are: (1) How are women mobility needs understood, conceptualized and accounted for in urban transport plans in India; and (2) how can women concerns be better integrated in urban transport plan making in India?

The paper presents a critical review of the Smart City plans developed under the Smart Cities Mission, a flagship program of the Government of India which aims to develop 100 smart cities in India by 2022. I review the first 20 winners of the first round of the mission which are representative of the different geographical areas. The review focuses on the transport section of the plans, and analyzes the inclusiveness of these plans in terms of the quality of overall goals/plan objectives, the plan making process and the projects identified by each city for implementation to become a 'smart' city. In light of the rising incidents of violence against women in India, the review also pays special attention to the kind of projects identified by cities that focus on the safety needs of women. The review is supplemented by interviews conducted for planners and policymakers engaged in designing and implementation of smart city scheme at federal level, and also planners involved in preparation of the smart city proposals in selected cities.

The preliminary findings indicate that the smart cities mission continues to ignore women by adopting a gender neutral stance to urban transport planning, and in doing so, reinforce the existing issues and barriers faced by women in meeting their daily mobility needs. The plans also fail to include women adequately in the citizen participation process which is the main focus of the scheme, with few exceptions (e.g. Bhubaneswar). With no attention to gender differences, the plans reflect narrow understanding of urban planners and policymakers in India about women travel needs and concerns.

The plans pay attention to women only in terms of improving the safety levels of men and women on streets at all hours. Most of the plans, however, with an exception of Bhubaneswar, are silent on improving women safety and security levels on public transit systems which have been in the news for being the main site for some high profile rape and assault incidents lately. The main and, in most cases, the only strategy adopted by cities to improve the safety levels of women is by increasing surveillance. The paper concludes with a discussion related to identification of measures for better integration of women needs in urban transport planning in Indian cities.

To my knowledge, this paper is the first of its kind review of the plans from a gendered lens. Given that the cities are planning implementation of proposed smart city plans, the research presents a unique opportunity in terms of

evaluating the plans and integrating women needs and concerns more effectively in urban transportation planning. The results should be of particular interest to planners and policy makers interested in gender sensitive planning and policy making in general and particularly in special context to India.

LIFE-SPACE MOBILITY AND AGING IN PLACE

Abstract ID: 1007

Individual Paper Submission

KIM, Ja Young [University of Utah] jaykim37@gmail.com, presenting author

GARCIA ZAMBRANA, Ivis [University of Utah] ivis.garcia@gmail.com, co-author

Research on older adults explores the notion of “aging in place”—providing older adults the opportunity to continue to occupy familiar surroundings, to live in their own homes and communities. But oftentimes one’s ability to stay or leave, particularly in old age, depends on the built environment. Mobility is the ability to meet the basic needs to access goods, activities, services, and social interactions as they relate to the quality of life (Mollenkopf, 2005). Thus, mobility is essential to older adults due to their limited, or gradually reducing, physical and cognitive abilities. In transportation research, mobility is often regarded in terms of travel behavior and it is measured by the number of outside-home travel. However, in other fields, including public health, it refers to the relative ease and freedom of movement in all of its forms (Satariano et al., 2012). This study intends to broaden the understanding of the environmental factors on older adults’ mobility in different life-spaces, from one’s bedroom to sidewalk, from home to a final destination via walking, public transit and/or driving. We will document and examine 1) the ways in which older adults talk about, understand, and make meaning of their experiences and conditions related to life-space mobility and, 2) how these frames of reference guide their ability to be able to age in place. To achieve these objectives, we will develop a life-space mobility assessment tool and conduct semi-structured interviews with 50 older adults who have participated in home accessibility modification programs in Salt Lake County (Utah) and Multnomah County (Oregon). Given that interviewees already have engaged in some level of self-determination to improve their lives at home, we are interested in their life-space mobility and which opportunities they might see to improve their auto-sufficiency. Our work will provide both a basis and springboard for studying further geographies and discussion about policy initiatives to effectively and equitably address growing mobility disparities.

THE RIGHT TO (RE)SHAPE THE CITY AS A PERSON LIVING WITH DEMENTIA: IDENTIFYING BARRIERS AND ADAPTING THE OPEN HOUSE – LESSONS FROM WATERLOO, CANADA

Abstract ID: 1059

Individual Paper Submission

BIGLIERI, Samantha [University of Waterloo] sebiglie@uwaterloo.ca, presenting author

BACKGROUND: There has been a call from US policy advisors to expand the studying of people living with dementia (PLWD) from health and social care to that of urban planning (Lin & Lewis, 2015). The number of PLWD will increase from 47 to 115.4 million worldwide by 2050. Estimates show that 65-80% of PLWD live in community as opposed to congregate living, however PLWD are not included in the planning process that seeks input from citizens and shapes the places they live in, as they are generally only sought to comment on health/social care policy for themselves (Lin & Lewis, 2015). This is likely due to perpetuated societal norms about PLWD which presume incapacity, resulting in widespread stigmatization. These prevailing notions see PLWD as passive care recipients instead of citizens (Bartlett & O'Connor, 2010). Thus, this research takes the position of PLWD advocating for themselves – that PLWD are people with a disability, citizens, who have the right to be accommodated in society (Swaffer, 2014).

RESEARCH OBJECTIVE: To understand the experiences of PLWD at an Open House (a typical planning consultation tool) to examine barriers and facilitators of meaningful participation.

APPROACH: Many planning scholars have asserted that meaningful involvement of the diverse publics in planning processes are more likely to result in just planning outcomes, and in order to build participatory democracy, we have to work harder to include marginalized voices (Fainstein, 2010; Young, 1989). Thus, this research understands citizenship as involvement in the planning process, and uses a participatory methodology to understand barriers/facilitators and imagine what a dementia-accessible Open House could look like.

METHOD: Twelve community-dwelling participants with self-identified, mild, young-onset dementia (diagnosed under the age of 65) were recruited through community organizations in Waterloo. The study involved the researcher and an individual participant attending a local planning Open House, with the participant being encouraged to interact as they normally would, and the researcher conducting systematic observation (proven to be a successful technique when conducting research with PLWD and their environment, since one is able to observe their actions without researcher interference). The second phase included post-activity interviews with individual participant to (1) understand their experiences and perceived barriers/facilitators to participation in the Open House, and (2) further probe instances of confusion and/or concentration as witnessed by the researcher. The data from both phases were analyzed separately, using a critical grounded theory approach.

FINDINGS: This research illuminates barriers and facilitators to inclusion in the Open House setting for PLWD. Specifically, this research revealed areas of tension, discomfort and confusion for PLWD, but also gathered information from PLWD themselves on how the Open House could be adapted to make it more accessible to their needs as someone living with dementia. These findings are separated into four categories: physical/sensory setting; presentation of information (visual/ auditory); communication with other citizens/professional staff; and mechanisms for seeking meaningful feedback.

RELEVANCE: PLWD are, and always will be, citizens of the places that they live in, and as such, have the right to (re)shape their city as a citizen (Lefebvre, 1996). There is a chance for planning scholarship and practice to lessen stigmatization and expand the concept of citizenship for PLWD, from understanding citizenship as advocating for one's own care/national policy (Bartlett & O'Connor, 2010) to making an accessible space for them to have a voice in the process of city building. PLWD have a right to be consulted about how their

neighborhoods enable or disable them, and this study demonstrates the strong potential for this to happen through adapting this well-known tool in the planning process.

TITLE: TOWARD A TYPOLOGY OF PUBLIC HARASSMENT

Abstract ID: 1065

Individual Paper Submission

FLORES, Nina M. [California State University Long Beach] nina.flores@csulb.edu, presenting author

The #MeToo campaign highlights the prevalence of sexual harassment and sexual assault experiences. People share workplace harassment by their bosses, academic harassment by lecherous professors, and even previously untold stories about past sexual assaults. When it comes to planning, scholars and practitioners should feel a sense of urgency around the issue of street harassment and assault experienced in public spaces, both of which can present gendered barriers preventing access to full rights to the city (Fenster, 2005). As with the accounts revealed during the #MeToo campaign, women are not the only people to experience street harassment. A recent report suggests that almost 70% of women and 26% of men have experienced sexual harassment in the public spaces of parks, streets, transportation, and more (Kearl, 2018).

However, harassment experiences in public space are not always sexual in nature. Although the term street harassment traditionally refers to undesired sexual advances such as catcalling, groping, or leering, in this paper I propose that street harassment is only one category within a broader range of harassment experienced in public spaces. I use the term public harassment, which is more inclusive of incidents that may be driven by systems of advantage and oppression such as racism, heterosexism, nationalism, ableism, and more. In this paper I present ideas for moving toward a typology of public harassment.

This paper extends the work of my dissertation research on street harassment, in which I analyzed 10,000 tweets to examine how virtual public spaces are used to share experiences with—and to resist—street harassment occurring in physical public spaces (Flores, 2016). In the present study I developed a database of news stories, blogs, and social media posts about harassment incidents occurring in public during the past year. For the purposes of this study, criteria included stories that demonstrate that a person(s) intend to initiate unwanted or derogatory contact with another person in public. From here, I was able to perform a content analysis and take the first steps toward developing a typology of the range of harassment that occurs in public space.

By expanding our understanding of the types of harassment than can occur in public spaces, and the systems of advantage and oppression that drive that harassment, this research and further work toward developing a typology of public harassment has implications for planning literature, education, and practice.

CHOOSING A NEW NEIGHBORHOOD? : THE CASE OF RECENT IMMIGRANTS AND ETHNIC NEIGHBORHOOD CONTEXTS IN NORTH TEXAS

Abstract ID: 1134

Individual Paper Submission

KIM, Kukhyoung [University of Texas at Arlington] kukhyoung.kim@mavs.uta.edu, presenting author

Substantial researchers explain the social networks within ethnic neighborhoods and its significant contribution on how immigrant households make neighborhood choice with respect to racial composition. Ethnic neighborhoods so-called “ethnic enclaves” (Wilson and Portes, 1980) and “ethnic niches” (Waldinger, 1994), provide greater benefits as a result of repeated actions of social networks and information flow that connect newcomers to housing and employment opportunities close to their settled co-ethnics. Despite widespread interest in social networks within ethnic neighborhoods, there is lack of in-depth studies on how recent immigrant choose their new neighborhoods in terms of social, economic, and physical characteristics of neighborhoods.

This research refers to neighborhood choice of recent immigrants and ethnic neighborhoods' context in North Texas. North Central Texas, which is primarily the area of Dallas-Fort Worth Metroplex, is one of the most populous metro areas with immigrants (American Community Survey, 2016), however relatively little scholarly studies conducted on ethnic neighborhoods and recent immigrants in this region. This study extends that literature by figuring out the location of immigrant neighborhoods by examining the spatial arrangement of socioeconomic and physical factors within North Texas region. It mainly focuses on the classification of ethnic neighborhoods in North Texas area from 2012 to 2016.

How to classify ethnic neighborhoods is key in this study. According to literature and dataset, three factors of social, economic, and physical characteristics are considered to select variables of ethnic neighborhood classification and the cluster analysis is applied for classification. The main conceptual measures are introduced:

1. Social factors: racial isolation index, which describes the majority ethnic group in the neighborhoods, recent immigrant concentration, household size, and so on.
2. Economic factors: many factors determine the income segregation including income inequality in the region. In this paper, it denotes the uneven family distribution of different household income levels, renter ratios, job-housing balance, employment accessibility, and job density.
3. Physical factors: residential density, accessibility by transit (bus and rail), and food accessibility.

This study contributes to better understanding of how recent immigrants chose their neighborhoods in a new destination, especially in consideration of socioeconomic and physical characteristics of their neighborhoods. The findings from this research draw further attention to a significant role of accessibility, affordability, ethnic capital, and preference for neighborhood choice and spatial mismatch between residence and workplace.

GENDER, PARTICIPATION, AND RESILIENCE: MAKING THE INVISIBLE VISIBLE

Abstract ID: 1162

Individual Paper Submission

CAI, Yanjun [University of Toronto] yanjun.cai@utoronto.ca, presenting author

Facing hazards, women, especially those in the disadvantaged communities, are exposed to greater risks while their capacities in building community resilience have not been sufficiently explored (Nelson & Stathers, 2009). Meanwhile, planners have applied different participatory approaches to address community needs, mobilize resources, and build trust and leadership, especially in the Global South (Chu, Anguelovski, & Carmin, 2016). Nontraditional participation is increasingly called for to emphasize the inclusiveness and potential transformation from the perspectives of affected populations, with particular attention to marginalized populations (Chandrasekhar, Zhang, & Xiao, 2014). Recently, photovoice, as a participatory action research method, has been increasingly utilized in various fields for hazard preparedness, mitigation, and recovery (Crabtree & Braun, 2015). The application of photovoice aims to discover critical issues, recognize the resources of marginalized populations, and develop transformative strategies. However, photovoice is seldom used by planning scholars and practitioners (Harris, 2017). This participatory action research integrates photovoice with social media to examine how community resilience building can be gendered in the Philippines. The Philippines consistently ranks among the most vulnerable countries regarding disaster exposure, susceptibility, coping and adapting capacities. Through the visual narratives, unstructured observations, and semi-structured interviews, the study: (1) reveals gendered risks and adaptation through the lens of a marginalized population and (2) discovers the challenges and opportunities for a more inclusive and effective resilience planning. Specifically, this work explores a gendered resilience planning in three informal settlements in metropolitan Manila and Cebu, Philippines. It presents participatory resilience building in Southeast Asia, an emphasis on urban poor women. The integrated approach of photovoice and social media disseminates local knowledge, brings in empowerment, and transforms the gendered community resilience through collaboration beyond the affected populations. As an uncommonly used method in planning, photovoice demonstrates significant value in revealing the invisible local lens, promoting participation, transforming community power structures, and linking knowledge with action. This integrated research emphasizes community resilience building that directly shaped by the marginalized urban poor populations instead of the external experts. It contributes to the growing literature in the nontraditional participation of resilience planning with an emphasis on gender, cultivating inclusiveness and transformation in the era of social media.

THE RELATIONSHIP BETWEEN HOUSING IMPROVEMENT AND NEIGHBORHOOD SEGREGATION: A CASE OF BROWNSVILLE, TEXAS

Abstract ID: 1186

Individual Paper Submission

SAFAROVA, Bara [Texas A&M University] barasafa@gmail.com, presenting author

Income inequality in the United States grew between 1970 to 2000 and affected the growth of income segregation, further pronounced when measured by race (Reardon & Bischoff, 2011). Critique of 'desegregation' programs called for a shift of focus to the role of the market in housing segregation as it dictates housing prices, which determine who can live where (Slater, 2013). Even though many studies examined the impact of housing market and planning policy on racial and ethnic segregation, very few examined their role in income segregation in the U.S (Dwyer, 2007; Lens & Monkkonen, 2016; Rothwell & Massey, 2010). This study expands on this literature and examines the relationship between income segregation and the processes of housing production. This study hypothesizes that neighborhoods with housing stock produced through small scale, incremental construction are associated with more socio-economically diverse neighborhoods. The hypothesis is tested in the case of a U.S. - Mexico border city: Brownsville, Texas, where several incremental housing processes can be found. Historic fabric built prior to the 1910s ascendance of the Community Builder comprises small-scale, incrementally improved housing (Ames & McClelland, 2002). Housing in the colonias along the U.S. – Mexico border has been built predominantly incrementally (Giusti & Estevez, 2011; Ward, 1999). Finally some incremental housing techniques have been identified within the Latinx Urbanism literature in cities with high proportions of Latinx population in the Southwest (Davis, 2000; Diaz & Torres, 2012; J. Rojas, 2010; Talen, 2012).

To determine whether a correlation between incremental construction and the production of socio-economically diverse neighborhoods exist, a novel approach has been tested. Tax appraisal district data were aggregated into subdivisions and house value variance was used as a proxy for socio-economic diversity. Geographically weighted regression was used to determine correlation between levels of socio-economic diversity and the number of housing increments.

Preliminary results show that socio-economically diverse neighborhoods are not associated with incremental construction in unincorporated colonias, or the historic downtown areas - where predominantly low-income population lives. Retirement communities, which allow for incremental construction show higher levels of socio-economic diversity. Newer neighborhoods on the edges of the city limits have lower levels of housing improvements and socio-economic diversity.

The results will inform future federal 'desegregation' programs in areas dominated by Latinx population aimed at reducing income segregation: (1) without the relocation of low-income population, (2) allowing for cultural norms and values of Latinx population to be expressed in the physical form of the housing stock.

THE QUEST FOR GENDER-RESPONSIVE PLANNING: A COMPREHENSIVE STUDY OF COLOMBIAN MUNICIPALITIES

Abstract ID: 1207

Individual Paper Submission

LOZANO TORRES, Yancili [Florida State University] yancillyt@gmail.com, presenting author

Despite the stereotype as a patriarchal region, several Latin American countries score higher in the global gender gap index than some developed countries. According to the UNWOMEN (2013), these countries are making substantial progress in terms of critical aspects of the feminist agenda, such as political and economic empowerment. In countries like Colombia, a unitary state, the path towards gender equality for women usually starts from nationwide mandatory laws to be enacted by the local level, where the only form of municipal government is of a Mayor-Council system. Colombia has nominally strong laws that seek to advance gender equality. However, legalism does not necessarily lead to compliance and for Colombia, achieving gender-responsive planning (GRP) is a matter that goes beyond the existence of good laws (Lozano-Torres & Doan, forthcoming). What are then the elements that lead to having a Gender Responsive City? What are the conditions that help with gender equality at the local level in countries that have weak ties between laws and law implementation?

The feminist literature highlights several variables that play an important role in advancing progressive agendas to reduce gender inequalities (Burgess, 2008; Damyanovic & Zibell, 2013). I contend that responsiveness towards women's needs is a function of the following four dimensions: (1) WHO is doing the planning, (2) for WHOM is the plan done, (3) the INSTITUTIONAL context surrounding the process, and (4) the planning APPROACH used. In other words, GRP depends on having women in power (Park, 2013), the community's characteristics, the institutional readiness for gender equality, and the planning method. Since governments and urban planners still struggle to develop strategies to address women's interests effectively (Fainstein and Servon, 2005), this study represents a contribution in identifying effective strategies to serve women's needs.

From a sample of 297 Colombian cities, I built an index (GRP) of gender responsiveness using Content Analysis and identified the variables that make a city more gender progressive, using an OLS regression. Results indicate that the responsiveness to women's needs from a city highly depends on the institutional context surrounding the planning process and the characteristics of the people for whom the plan is done. The WHO dimension was found significant but negative, which needs further research because the number of women in power was less than 20 percent. Additional research is forthcoming.

This study provides an in-depth quantitative analysis that can help planners, public administrators, and decision makers not only understand the variables determining responsiveness to women's interest, but also define what strategies can be used to achieve gender equality. It also helps to corroborate or dismiss different assumptions that planners have followed in terms of what helps advance gender equality.

LANGUAGE TOPOGRAPHIES AND THE CITY: INSTITUTIONS OF SPOKEN LANGUAGE USE AND LANGUAGE MAINTENANCE AMONG SIX LINGUISTIC MINORITY GROUPS ACROSS NEW YORK CITY

Abstract ID: 1249

Individual Paper Submission

BRAWLEY, Dare [Columbia University] db2672@columbia.edu, presenting author
 BAIRD-ZARS, Bernadette [Columbia University + Alarife Urban Associates] bvb2108@columbia.edu, co-author
 MCSWEENEY, Michelle [Columbia University] mam2518@columbia.edu, primary author
 KURGAN, Laura [Columbia University] ljk33@columbia.edu, co-author

Large urban areas are sites of intense linguistic and cultural diversity: ‘multipli-cities’ that have been expanded by global migration (Sandercock 1997, 28). The world’s largest urban centers now hold unprecedented linguistic diversity as global migration patterns have shifted and more people from a greater variety of places move to urban centers, a process that has resulted in super-diverse cities (Vertovec 2007). In New York City alone, it is estimated that over 800 languages are spoken, many of which are vulnerable or endangered. At the same time, the global trend towards language shift (the process by which a group of people stop speaking one language, and start speaking another), often occurs in response to the social and economic pressures migrant families face upon moving to a new country. While second languages can be a powerful economic asset - for individuals and urban areas - second language ability typically disappears completely by three generations after migration or urbanization. Despite being such a fundamental aspect of identity, the topographies of language usage and institutions (beyond access to translation or exclusion from public processes) have been little-studied in planning literature to date.

And yet, languages are only maintained when speakers use them, and cities are sites of speaker concentration. By analyzing the spatial organization of language use in New York City, this paper interrogates how minority languages are organized in the city and the relationship between institutional infrastructure – public, private, religious and civic –but excluding commercial- and language maintenance and pride.

To examine the ‘topography’ of spoken non-English language use, we used an embedded single case study framework (Flyvbjerg 2001), drawing on network analysis, institutional analysis and spatial clustering to identify meaningful patterns of language organization within New York City. This complements findings from linguistics that studies of language maintenance and language shift traditionally require a mixed-methods approach, combining qualitative and quantitative data to develop a more complete picture of the how individual speakers’ attitudes inform larger social trends.

Drawing on a year of analyses by a large multi-disciplinary team, deep-dive examinations of six languages (Armenian, French, Haitian Creole, Thai, Tagalog and Russian), identify the relevant institutions of language use across New York City by frequency, intensity, and scale. The analyses combined census data with sites of language use and speaker interviews to determine if and how places outside of the home where the language is used affects its maintenance and transmission to the next generation. Though data analysis and mapping, the paper illustrates how languages are situated in the city and the relationship between where speakers live and speak.

Preliminary results suggest several distinct patterns of institutional topographies, including ‘lines’ of migration along transit corridors and the typified ethnic enclaves as spatial clusters (Waldinger 1993). Time and privilege matter; languages with earlier and wealthier immigrants tend to have more ‘brick and mortar’ structures to support language use. Yet for some languages, such as Haitian Creole, the meaningful institutions are not physical

buildings, but permanent and annual events such as parades, concerts and celebratory gatherings. Religious institutions, and their divisions, particularly connect and splice some communities of speakers, such as Tagalog and Armenian; for Russian speakers, 'takeovers' of public institutions, such as library events, appear to have the strongest connection with the likelihood of language maintenance. Planning understands difference; power in planning processes often stems from cleavages in identity (Huxley and Yiftachel, 2000), yet little work examines the ability of language maintenance as part of the planning project. Through the 'patterned heterogeneity' of findings, this paper traces institutions of meaning for language as a critical facet of diversity and identity present in urban areas worldwide.

FRAMING GENTRIFICATION: BALANCE AND DIVERSITY IN AN URBAN ETHNIC ENCLAVE

Abstract ID: 1264

Individual Paper Submission

HOM, Laureen [University of California, Irvine] ldhom@uci.edu, presenting author

Since the early 2000s, Los Angeles Chinatown has been identified as a gentrifying neighborhood. However, gentrification has also become a politically contested term about how new people, developments, and investments are coming into a low-income community and perpetuating urban inequalities and segregation (Brown-Saracino and Rumpf, 2011; Newman and Wyly, 2006). While there are scholars, political advocates, and the media who argue that gentrification leads to the displacement of the urban poor, concerns about the persistence of areas of concentrated poverty have also led to policies and approaches of reinvestment that focus on "social mixing" and "diversity" as a way to combat neighborhood decline. Despite mixed evidence that policies promoting social mixing have a positive impact on improving the socioeconomic status of individuals living in areas of concentrated poverty (Lees, 2008), this concern to create a "diverse" and "balanced" neighborhood was an underlying logic about gentrification among many Los Angeles Chinatown community leaders. This narrative was expressed whether in resistance or accommodation to changes that would potentially shift the neighborhood identity away from a predominantly poor and working-class immigrant community.

Drawing from ethnographic research on Los Angeles Chinatown from 2014-2017, this presentation examines these local framings of diversity and balance to provide insight to how ethnic communities understand and respond to gentrification. Using a narrative analysis of interviews and observation data, I identified three categories of frames about Chinatown: temporal, spatial, and ethnic community. The temporal and spatial narratives showed that those who were concerned with gentrification, and the possible diversity that came with it, linked it to a lack or weakening of community control given the housing and commercial developments proposed for the neighborhood. While those who felt there was strong local leadership were more likely to see gentrification as a neutral or positive change and supported diversifying the neighborhood through these new developments. The ethnic community narratives also showed concerns with community control. The lack of Chinese American engagement and investment, especially from the middle-class, positioned Chinatown for decline and ultimately vulnerable to gentrification. These narratives indicate that concerns over gentrification was less about the type of physical changes. Gentrification was seen as an issue of community political power and how it is shifting, and in some cases, threatened.

The findings show how ethnic neighborhoods have diverse community actors who vary in how they make sense of change. Some may even specifically reconceptualize arguments about gentrification to assert control over neighborhood change. Yet, these changes may only reflect a specific voice of the community and may not always lead to equitable planning that benefits the most disenfranchised in the neighborhood. The presentation underscores the importance of understanding the use of framing in understanding power differentials within communities when addressing how ethnic neighborhoods and communities are situated in the city's gentrification debates.

THE RESILIENCE PLANNER'S PARADOX: RESILIENT AFRICAN-AMERICAN 'NEW TOWNS' OF FLOOD-PRONE, NEW ORLEANS

Abstract ID: 1282

Individual Paper Submission

AIDOO, Fallon Samuels [University of New Orleans] faidoo@uno.edu, presenting author

Between 1950 and 1980, New Orleans East, Inc. and LaKrat Corporation sponsored professional planning of single-family subdivisions exclusively for “colored” middle-class New Orleanians. This paper, which draws on traditional and innovative preservation research such as title searches, oral history, remote sensing and participatory GIS, explores how the majority of homeowners in these deed-restricted subdivisions rebuilt their residences after extreme weather events (hurricanes, tornados and excessive rainfall) with remarkable consistency, reinforcing their historical significance and economic value. Through two case studies, namely Pontchartrain Park and Academy Park, this paper further illuminates how contemporary projects of hazards mitigation at once jeopardize grassroots resilience planning and reinforce generational means of African American stewardship of the built environment. Likewise, the social and spatial integrity of these planned communities, which helps makes them eligible for the National Register of Historic Places, present opportunities and obstacles to their protection from environmental and economic threats such as storm surges and gentrification. These trade-offs are illuminated through data visualization, specifically ESRI StoryMaps co-produced by homeowner associations and the author's research team. Altogether, the research presented will expand the evidentiary basis of preservation planning to the epicenter of suburban gentrification: historic suburbs.

WE WILL NOT BE MOVED! DETROITERS REFUSE THE DISPLACEMENT AND DOMINATION OF GENTRIFICATION

Abstract ID: 1321

Individual Paper Submission

LASKEY, Allison [University of California Irvine] alaskey@uci.edu, presenting author

This paper reports on ethnographic research from the campaign against displacement, resegregation, and gentrification in Detroit Michigan, led by the resident group Charlevoix Village Association (CVA). Like most of Detroit, CVA's neighborhood has been in dire need of resources for decades. Since the 1970s, CVA has fought for improvements to the neighborhood like streetlights, alleyway cleanup, and home repair funding. Meanwhile, their neighborhood libraries all closed, garbage pickup became sporadic, and a new "drainage" fee was added to the already inflated water bill. As a hardest hit city by the foreclosure crisis, Detroit's lower eastside lost 44% of its population between 2000 and 2010. Studies now show that a large proportion of the foreclosures were based on unconstitutionally high tax assessments and therefore were illegal. Like the majority of Detroit, the majority of the lower eastside is poor and working class African-American residents. Inflated tax assessments, plus late fees, were enough to force a significant number of people from their homes.

After the 2013 municipal bankruptcy and the heaviest bouts of foreclosures, the City and developers branded CVA's area "Islandview" -- indicating a concerted effort to transform it. Homeowners received letters from strangers offering to buy their houses. Rents started rising. The City of Detroit hired contractors; speculators purchased land; nonprofits and community development corporations (CDCs) wrote plans; and developers made deals. Between 2010 and 2015, the white population in CVA's area grew by 116%, while the black population decreased by 15%. In 2017, it was estimated that more than half a billion dollars will be invested in the CVA's district.

When the community engagement portion of the City's neighborhood master planning process for Islandview began, long-term residents saw the deck stacked against their interests. The new wayfinding signs for "Islandview", the fancy coffee shops, and the elaborate bike lanes were not at all designed for their enjoyment or to meet their pressing needs. This increased "quality of life" would bring them cost of living increases without income increases. Long-term residents read the signals of change to mean that they are being replaced in favor of a wealthier, whiter population. How would they afford to stay?

Planners are increasingly studying gentrification as a neoliberal phenomenon, but most studies focus on quantitative, economic, and aggregate effects. This results in an inadequate understanding of how and why gentrification affects long-term residents and its role in supporting inequality and segregation within urban areas. This paper corrects for these shortcomings with ethnographic data that foregrounds the voices of long term Detroiters and focuses on their experiences and analyses. It also explores how a variety of entities participate in the process of displacement.

My participant observations and interviews center on the general membership of the CVA and the CVA's campaign to defeat displacement, resegregation, and gentrification. As I participated with/observed CVA, I also documented the role of Detroit's City Council and many departments in the Mayor's administration (primarily Planning & Development and Housing & Revitalization); several nonprofit organizations and CDCs; several for-profit developers and designers; and a number other grassroots organizations. This paper reports on the role of each of these entities in the planning process for Islandview.

ETHNICITY AND GENDER IN THE URBAN STUDIES AND PLANNING FIELD: IS DIVERSITY IMPORTANT IN MAKING DECISIONS THAT AFFECT MINORITY COMMUNITIES?

Abstract ID: 464

Poster

WOLDEAMANUEL, Mintesnot [California State University, Northridge] mintesnot.woldeamanuel@csun.edu, co-author

PEREZ, Areli [California State University Northridge] areli.perez.755@my.csun.edu, presenting author

In planning schools, students learn how to plan more efficient cities with diversity in mind. Diversity is also the forefront of most city and community plans. In fact, many planning schools throughout the United States include diversity in their curriculum; but how diverse are planning agencies and those in the urban studies and planning field themselves?

With an increase in ethnic diversity, it is important to remember that planning decisions affect all races, ethnicity, genders, religions, sexual orientation, and income levels. Previous studies on diversity in the urban studies and planning have found that there is an over-representation of one ethnic group in the field. This could be due to the lack of diversity in planning schools, which leads to a lack of diverse urban planners (Tiarachristie, 2016).

Currently, there are only few studies that focus on diversity in the planning field, and the meaning of diversity in terms of decision making. So, the primary question being explored in our study is: is diversity in the planning field important in making decisions that affect minority communities? This research focuses on gender and ethnic diversity in the urban studies and planning profession. The aim of our research is to explore the meaning of diversity to urban studies and planning professionals, and its implications (if any) on decision making in minority communities.

In order to understand the views and perspectives of those in the urban studies and planning profession, data is collected through surveys of urban planners in multiple sectors. The survey consist of nine socio-demographic and six Likert scale opinion questions on diversity, and three open-ended questions. The survey reaches a variety of professionals from the public, private and non-profit sectors, academics, and students in the urban studies and planning field.

The data analysis consists of both qualitative and quantitative methods. Content analysis of the open-ended questions assists in finding a potential connection or relationship among planners and their views on whether diversity in the planning profession influences decision making processes. Descriptive and advanced statistical analysis produces results on the casual relationship between ethnic and gender diversity and its implications in the urban studies and planning field.

This research is expected to yield results that urban planners in the field may feel that they do not have to be an ethnic-minority to understand, and advocate for minority communities. In contrast, urban planning students and nonprofit planners may feel that ethnic and gender diversity is significantly important and it impacts minority communities, or the city at large.

With scarcity of research that focuses on gender and ethnic diversity in the urban studies and planning profession, this research has great significance in informing the planning community of the importance of diversity and inclusion. Urban Planners know that cities are becoming multicultural (diverse), and they understand the importance of planning a multicultural city. Therefore, planners from multiple sectors need to recognize a common ground in city and community planning, particularly when it comes to decision making in low income and minority communities. And that answer is through diversifying the urban studies and planning professionals.

THE LINKAGE BETWEEN SINGLE FAMILY ZONING AND WOMEN'S COMMUTING PATTERNS IN THE PUGET SOUND REGION

Abstract ID: 1140

Poster

MICKLOW, Amanda [Cornell University] acm325@cornell.edu, presenting author

Women's travel patterns are impacted by their household status and responsibilities. Women are still primarily responsible for household care and maintenance activities such as childcare, shopping, and caring for the home (American Time Use Survey, 2016). And the majority of American women also engage in work outside of the home, meaning that women's journeys to work are often more complex than those of traditional male commuters. Women's work trips are also shorter than men's, their labor markets are smaller, and their employment opportunities are accordingly more limited (Crane, 2007). The explanation being that women's traditional gender roles inhibit their labor market status by constraining their space-time budget. Women have less time to travel to and from work than men thereby reducing the quantity and quality of jobs to which they have access (Rapino & Cooke, 2011; Kwan, 1999).

This poster builds on previous research by incorporating the spatial structure of a woman's community as an additional constraint to her mobility and employment options. Using a 2015 household travel study of the Puget Sound region of Washington, this poster demonstrates the impact of land use regulations on women's commute time and distance. This expands on previous studies of women's spatial entrapment by incorporating a dummy variable for single-family zoning. The inclusion of this variable is of particular importance to the study of gendered travel patterns because it acknowledges the impact of land use regulations on gender roles. This work also helps to advance the discussion of gendered differences in planning from a theoretical discussion of the embeddedness of traditional family values in municipal zoning regulations to a testable hypothesis: that women living in lower density areas, or those regulated by single use zoning ordinances, will face different spatial constraints than their male counterparts; than women in different locations within the same metropolitan area; and that these differences will vary by age, race, and income.

This poster utilizes an existing household travel survey of the Puget Sound region conducted in 2015 by the Puget Sound Regional Council as its primary source of data. The final dataset contains information for 4,786 individuals in 2,495 households identified at the census tract level. Additional data for the regression analyses is pulled from the American Community Survey 5-year estimates. Preliminary results indicate that white, married women with children have significantly shorter commute time regardless of location within the region (city or suburb). Women with higher levels of educational attainment or income and those women with a reliance on public transportation have the longest commute times. After accounting for differences in individual and household level characteristics, single-family zoning is positively correlated with commute time for men and negatively for

women. These findings demonstrate that women, especially married women, have shorter commutes because their traditional role as family caretaker results in more domestic responsibilities, lower labor market status, and consequently fewer transportation options.

THE END OF THE DIVERSE CITY?

Abstract ID: 1319

Poster

VAZQUEZ CASTILLO, Maria Teresa [Universidad Autonoma de Ciudad Juarez] ma.tere.vazquez@gmail.com

The current state of affairs worldwide signals the emerge of regressive social movements and political forces that challenge the acceptance of diversity or, at least, question very seriously this idea, with evident implications for urban planning and urban life. Although, the seeds of this rejection have always been in place, many, even in progressive settings, decided to take them lightly or to ignore them, assuming they would not gain terrain. In urban planning, the acceptance and promotion of the idea of diversity was manifested in practice by the policies to support the so-called diverse city. This ideal city would welcome and accept all differences and would promote interactions among diverse groups. According to some theorists of the diverse city, the more the diversity of identities comprised in it, the more it would reflect its level of justice, innovation and progressiveness. Policies attending the needs of diverse groups, based on race, ethnicity, gender, age, disability, and religion, among others, had the intention of creating an innovative urban area according to the demands of the XXI century.

On the other hand, in the late nineties a movement of organized groups against the idea and practice of the diverse city emerged slowly and silently. Representatives of this movement participated in city councils and were decision makers with the power to apply urban policy to crush and reverse the idea and practice of diversity. By the 2000s, the attack against the idea of the diverse city was on its way in the form of anti-immigrant measures and zoning ordinances to expel the different and the unregulated. This anti-diversity movement has strengthened worldwide.

On one hand, this paper identifies the emergence of the idea of the diverse city and the urban theory and policy that promoted it, as well as its implications for urban planning and practice. On the other hand, it identifies the current context that has led to the rejection of the idea de the diverse city, as well as the responses from the diverse populations, the planning community, and policy makers in diverse cities in order to elucidate the implications for urban planning and urban theory and practice. It explores questions of identity and power, globalization, individualization, and migration in order to answer the following questions: Are we witnessing the end of the diverse city? And, if not, what are the alternatives to deal with such a rejection as the reality of cities continues being diverse? What would be the implications of for planning? And if so, what could be the next utopia or dystopia for cities in the current century?

ARCAYA, Mariana [Massachusetts Institute of Technology] marcaya@mit.edu
FREEMAN, Lance [Columbia University] lf182@columbia.edu

Despite the diversification of the United States population, residential segregation based on race continues to characterize both our schools and our living environments. Residential and school segregation based on income have also risen significantly over the past two decades, at the same time as the gap between rich and poor Americans has reached levels not seen since the early 1900s. This roundtable engages key contributors to the forthcoming *Dream Revisited* book to discuss causes and consequences of both racial and economic segregation and different approaches planners might take to address them. Participants will consider the impact of segregation on health, education, job access, and political discourse, and will consider how state, local, and federal housing policies, such as the Low Income Housing Tax Credit, the Housing Choice Voucher program, and inclusionary zoning, can help to ameliorate both segregation and its effects. Is racial or economic integration of neighborhoods or schools necessary to achieve economic and racial equality? What are the causes of residential and educational segregation today? To what extent are the neighborhood inequalities and the divergence in individual outcomes associated with residential segregation caused by segregation itself or by other factors? What are the merits of different policy responses?

ROUNDTABLE: OTHER GEOGRAPHIES OF GENTRIFICATION

Abstract ID: 268

Roundtable

CHARLES, Suzanne [Cornell University] slc329@cornell.edu, moderator
GREENLEE, Andrew [University of Illinois at Urbana-Champaign]
HARWOOD, Stacy [University of Illinois at Urbana-Champaign]

AIDOO, Fallon [University of New Orleans] faidoo@uno.edu
HUQ, Efadul [University of Illinois at Urbana-Champaign]

Lees (2000) argues that scholars needed to think more critically about the geography of gentrification to analyze how its processes differ by spatial context and location. A number of studies have given attention to these questions in diverse communities across the U.S. and the world. This panel will address how scholarship that applies a critical geographic lens has and can continue to advance scholarly work on gentrification. This includes questions about what a critical geography of gentrification looks like, current gaps in existing scholarship, and how studies of “other” geographies can inform effective urban policy, planning, and community organizing responses aimed at mediating the negative impacts of gentrification on marginalized groups and communities. The panel will bring together scholars studying gentrification in different U.S. contexts, including urban, suburban, and rural communities in high-growth and declining Rustbelt metropolitan areas in the Midwest and Northeast. This roundtable is a continuation of the discussion that began at a roundtable of the same name at last year's ACSP conference and is updated to incorporate the viewpoints of different scholars.

ROUNDTABLE: PAUL DAVIDOFF'S CRITIQUE - STILL RELEVANT AFTER ALL THESE YEARS?

Abstract ID: 1163

Roundtable

REARDON, Ken [University of Massachusetts Boston] kenneth.reardon@umb.edu, moderator
RACITI, Antonio [University of Massachusetts Boston] antonio.raciti@umb.edu
KANDEL, Sajani [University of Massachusetts Boston] Sajani.kandel@umb.edu
ARIANI, Camilla [University of Massachusetts Boston] camilla.ariani@umb.edu
VELASQUEZ, Carlos [UMass Boston] carlos.velasquez001@umb.edu

Central Theme/Research Hypothesis:

This roundtable session will discuss the relevancy of Paul Davidoff's critique of mainstream planning contained in his classic JAIP article, "Advocacy and Pluralism in Planning". This article questions whether or not planners can be value neutral in their professional practice. It also challenges the existence of a unitary public interest by emphasizing the divergent interests existing within our increasingly diverse metropolitan regions. Furthermore, it highlights the tendency of municipal planning agencies to advance policies that favor privileged segments of society at the expense of the poor and racial minorities. The article concludes with an argument for planners to assist the disadvantaged in preparing quality plans representing their interests. According to Davidoff, these advocacy plans provide planning commissions with alternative data analysis, policy goals, and planning proposals that will improve the quality and fairness of planning decision-making. More than fifty years after its publication, this article remains one of the most frequently cited planning theory articles and a required reading within the core curricula of most ACSP member schools.

Research Approach/Methodology

The state of urban America and the nature of urban planning practice have changed dramatically since 1965. The participants in this roundtable will share their differing perspectives on two essential questions. First, is Paul Davidoff's critique of and prescription for "reforming" professional practice in the US still relevant? Second, what are the most important contemporary implications of Davidoff's critique of and proposed reforms of professional practice? The panelists who will initiate the discussion of these two important questions represent a diverse group of scholars in terms of cultural identity, professional specialization, age and gender.

The panelists' remarks will be based upon findings emerging from The Paul Davidoff Tapes Project at the University of Massachusetts Boston. This mixed-method research initiative is committed to documenting, on a public website, research materials illuminating Davidoff's contributions as a scholar, educator, practitioner, and activist to our profession (www.pauldavidoff.com).

Findings

While in its initial phase, this project has surfaced a number of previously unexamined aspects of Davidoff's work. Among these were his effort to serve as a co-developer of a Garden City-inspired development for autoworkers in suburban Mahwah, NJ; his 1969 campaign as a peace and justice candidate for Congress; and the divergence between Davidoff and his followers in terms of the locus of their practice – he focused on integrating suburban communities while most advocacy planners concentrate on the revitalization of inner city areas.

Roundtable participants interested in sharing their research on Paul Davidoff and advocacy planning will be encouraged to use the Paul Davidoff Taped Project Website as a vehicle for doing so. The session organizers are particularly interested in collecting and posting advocacy plans produced by scholars in support of resident-led planning in low-income urban and rural communities on this site.

Relevance

Paul Davidoff has been disturbed by the uneven pattern of development characterizing metropolitan regions and the role planners often play in reinforcing this dynamic. More than fifty years following his *Advocacy and Pluralism in Planning* article income, wealth, and power disparities in metropolitan regions continue to grow.

PRE-ORGANIZED SESSION SUMMARY

GENTRIFICATION, NEIGHBORHOOD TRANSFORMATION AND THE ROLE OF PLANNING AND POLICY

Session ID: 4

Abstract ID: 74

Abstract ID: 75

Abstract ID: 76

Gentrification describes the transformation of neighborhoods from poor/working class to middle/upper class, accompanied by changes in the built environment, increased real estate values, and shifts in local social and cultural practices. Planners and policy makers have a complicated relationship to these processes. They often initiate and support measures such as building bike paths, designating historic districts or encouraging infill development, that are likely to catalyze gentrification processes. They are also, simultaneously, concerned with housing affordability and inclusive neighborhood development. Case studies of neighborhood level planning and policy in Columbus, Washington DC and Pittsburgh inform this panel which seeks to understand responses to gentrification and neighborhood change in the light of the contradictory role of planning/policy. Among the themes considered are planning for inclusive neighborhood development, tools that can improve disadvantaged neighborhoods while maintaining affordable spaces and the role of grassroots leadership. Comparisons between the case studies will be elucidated by the discussant.

Objectives:

- Participants will gain an understanding of neighborhood transformation processes in multiple North American urban neighborhoods as well as the role of planners/planning in promoting and/or mitigating impacts of such transformations
- Participants will gain an understanding of actors and tools involved in mitigating the impacts of gentrification in multiple urban settings.
- Participants will gain a critical perspective on the role of planning and policy in shaping housing markets and neighborhood conditions.

GENTRIFICATION IN PITTSBURGH: A COMPARISON OF METHODS ACROSS COMMUNITIES AND INDIVIDUAL IMPACTS IN ONE COMMUNITY

Abstract ID: 74

Group Submission: Gentrification, neighborhood transformation and the role of planning and policy

DEITRICK, Sabina [University of Pittsburgh] sabinad@pitt.edu, presenting author

In recent years, gentrification has attracted a great deal of attention from policymakers, community groups, residents, and the media. Gentrification is a complicated social and economic process that generally refers to changes in a neighborhood that result in some residents being displaced. The process of gentrification is often argued as a means to revitalize urban neighborhoods with new residents and populations, while opponents of gentrification argue that it displaces long-time residents. While much has been written on gentrification over the past thirty years, there has been little research on gentrification or possible gentrification in Pittsburgh. Though the term was coined fifty years ago (Glass, 1964), much of the literature on gentrification focused on the revitalization of American city neighborhoods in the 1980s and 1990s in cities such as San Francisco and New York City. The recent upsurge in investments in cities has brought about renewed interest in gentrification and new interest in cities where such investment trends had not been recognized until recently. Pittsburgh, a shrinking city with decades of population loss, was not part of those urban changes in the past. Its population continued to decline into the 21st century, and gentrification seemed far from most declining neighborhoods in need of revitalization. That has changed. This paper will compare data and trends on gentrification, by employing three different research methods and comparing their results. Though the indicators are similar in these studies, each includes a slightly different focus to understand neighborhood change and potential gentrification outcomes. The data will focus on demographic conditions and housing market factors, beginning with a baseline year of 2000 and analyzing change through 2016 with secondary datasets. We identify neighborhoods of gentrification in Pittsburgh, with new residents distinguished from long-standing neighborhood residents. This analysis will also identify communities continuing to experience decline and disinvestment. By identifying communities that are vulnerable to rapidly changing demographic and housing prices, policymakers and community groups can better plan for such shifts.

A NEIGHBORHOOD FOR ALL PEOPLE? THE HOLISTIC APPROACH TO SUPPORT EQUITABLE REDEVELOPMENT IN COLUMBUS'S SOUTH SIDE

Abstract ID: 75

Group Submission: Gentrification, neighborhood transformation and the role of planning and policy

REECE, Jason [The Ohio State University] reece35@osu.edu, presenting author

Gentrification is recognized as one of the primary factors reshaping North American cities in the 21st century. While the scholarship on the exact impacts of gentrification is mixed (Freeman, 2005 & Freeman, 2006), it is clear that long term impacts such as displacement are destructive forces which further urban inequity (Hwang & Sampson, 2014). While an abundance of anti-displacement toolkits can be found among practitioners (PolicyLink, 2018), case studies documenting successful anti-displacement efforts are less prevalent.

Gentrification forces vary based on the dynamics of the housing market. Gentrification processes unfold differently in these diverse housing markets found throughout North America. The gentrification experiences of coastal markets (or global cities such as Toronto or New York) vary substantially from experiences found in places like the rust belt. Case studies of anti-displacement efforts or gentrification processes tend to focus on global cities or coastal housing markets (e.g. Freeman & Bracon, 2004; Newman & Wyly, 2006). To fully understand the complexity of gentrification processes, case studies must document experiences in a variety of housing markets. This case study seeks to contribute to scholarship through documentation of the process of combatting displacement in a neighborhood within a Midwestern housing market.

The following case study documents the experience of South Side neighborhood, which is undergoing transformation in Columbus OH. Columbus is a Midwestern market, which has not followed the trajectory of typical rust belt regions. While pockets of disinvestment still abound, redevelopment is reshaping urban core communities in the city. These next generation areas of redevelopment are at the forefront of planning efforts to foster revitalization without gentrification and displacement. The South Side efforts have utilized a variety of planning tools to stem gentrification, ranging from leadership development, public private partnerships, youth development, economic development and housing stabilization.

The case study utilizes a mixed methods approach, including document review, interviews and secondary data analysis to present an assessment of the process and outcomes in neighborhood efforts to foster redevelopment without displacement. The case study will document not only the particular planning tools and community development models utilized, but also the complexity of the process. For example, understanding how efforts were communicated, how public support and funding has been maintained and understanding the conflict or challenges which have unfolded during implementation.

Abstract ID: 76

Group Submission: Gentrification, neighborhood transformation and the role of planning and policy

HOWELL, Kathryn [Virginia Commonwealth University] klhowell@vcu.edu, presenting author

Gentrification critiques are often framed around direct displacement from neighborhoods due to rising rents and home values. However, physical displacement is only one mechanism of change in neighborhoods, and framing it thus limits the way we understand neighborhood change (Howell 2017). Instead, the contests over public spaces that have emerged in spite of – or concurrent to - the preservation of affordability in some gentrifying neighborhoods have created social and cultural displacement of residents (Shaw and Hagemans 2015, Aptekar 2015). Like its physical counterpart, this displacement is depoliticized as the promise of “vibrant” future neighborhoods and its counter-factual, the dangerous and disinvested neighborhood, are pitted against the loss of culture in changing neighborhoods (Summers 2015).

Planning has had a troubling relationship to displacement from slum clearance and Urban Renewal Programs of the early and mid-20th Century to the large-scale redevelopment projects that have marked the past 30 years. Taking a traditional planning approach that focused on exchange value over exchange value, many of these redevelopments created a racialized economic landscape that continues to change the physical and cultural landscapes of cities around the world. However, as planners and elected officials have begun to understand the impacts on affordable housing, they have developed a variety of tools to prevent direct displacement. However, because formal planning often ends where implementation begins, we fail to anticipate the ongoing process of displacement that occurs through the life-cycle of a project, and, more importantly, the role that power plays in the way plans interact.

Starting in 1996, Washington, DC saw massive growth and redevelopment outside of the downtown core for the first time since the 1950s. Driven by the announcement of a new metro stop, the reacquisition 13-acres of land by the City atop the proposed transit stop and a growing demand for housing that moved north and east from U Street and Adams Morgan, the redevelopment of Columbia Heights included a massive big box retail center, new grocery store, open public space, mix-use and mixed income developments and set asides of space and funding for small and local retail. The project relied on a year-long community process for the master plan and another plan focused on the neighborhood’s central public spaces – both highlighted diversity and inclusion as key tenets of the development. In addition, the project used a mix of housing and planning tools that helped to maintain the neighborhood’s African American and Latino population and resulted in 20% of the total housing units remaining affordable. Many of these were in buildings with extended Section 8 contracts and in limited-equity cooperatives purchase through the District’s unique right of first refusal. In all, more than 2,200 units were preserved or created.

While the construction and preservation of hard units enabled many low- and moderate-income, primarily minority residents to remain in Columbia Heights, the changes in the neighborhood have also led to a shift in values and a change in implementation. Far from remaining in the hands of planners and affordable housing practitioners, implementation now rests with the Departments of Parks and Recreation, Police, Public Works and Consumer and Regulatory Affairs – who now answer to current residents. This has meant that while residents remain in the neighborhood, the terms under which they stay can be strained. This paper takes a look at Columbia

Heights a decade after the opening of the neighborhood's 13-acre redevelopment to understand the challenges will continue to complicate the relationship between planning and displacement or gentrification. It also demonstrates that displacement is an on-going process that extends beyond planning to implementation, management and future decision-making about the built environment.

PRE-ORGANIZED SESSION SUMMARY

GROUP SUBMISSION: SINGLE FAMILY RENTALS: TRENDS, IMPACTS, AND PLANNING IMPLICATIONS

Summary ID: 10

Abstract ID: 178

Abstract ID: 179

Abstract ID 180

This session will explore the rise of the single-family rental, which is home to an increasing proportion of U.S. renters. Single-family rentals are an enduring effect of the recent Great Recession, when real estate investors purchased and converted former foreclosures into rentals, and many households entered the rental market after experiencing foreclosure. This session will explore trends in single-family rentals, including where these rentals are located and the kinds of households who are making them home. We also will explore the impacts of rental conversions on single-family neighborhoods and the extent to which these rentals are helping to alleviate escalating crises of rental housing affordability and availability. Finally, we will consider what roles planners should play in managing the effects of single-family rentals, if any.

Objectives:

- Attendees will learn about a current housing trend and how this trend affects the planning profession.

NEWLY RENTER-OCCUPIED NEIGHBORHOODS IN THE WAKE OF THE GREAT RECESSION: TRENDS AND PLANNING IMPLICATIONS

Abstract ID: 178

Group Submission: Single Family Rentals: Trends, Impacts, and Planning Implications

PFEIFFER, Deirdre [Arizona State University] Deirdre.Pfeiffer@asu.edu, presenting author
WEGMANN, Jake [The University of Texas at Austin] jakewegmann@gmail.com, co-author
SCHAFFRAN, Alex [University of Leeds] A.Schaffran@leeds.ac.uk, co-author

An enduring but underexplored trend in the wake of the recent U.S. Great Recession is the growth of rental opportunities in single-family home neighborhoods. Close to two and a half million homes switched from owner- to renter- occupied between 2007 and 2011; the proportion of renters living in single-family homes increased

from 31% in 2005 to 34% in 2011 (Joint Center for Housing Studies 2013). Many new single-family rentals were former foreclosures purchased by investors, who ranged from small mom-and-pops to Wall Street companies.

Relatively little is known about communities that experienced growth in single-family rentals. More disadvantaged inner city communities of color had a greater volume of investor activity; however, investors' reach in the housing market also was wide (e.g., Immergluck & Law 2014; Pfeiffer & Lucio 2015). We do not have a clear sense of how the switching of properties from owner- to renter-occupied has affected neighborhood quality of life, and what role planners should play in moderating these dynamics if any. There is concerning evidence that neighborhoods with higher rates of investor-purchased foreclosures had higher crime rates and other adverse outcomes (Fisher & Lambie-Hanson 2012; Pfeiffer, Wallace, & Chamberlain 2015).

This paper will help to fill these gaps by using a multi-method approach to examine the characteristics and experiences of neighborhoods that experienced different kinds of growth in single-family rentals between 2005 and 2016. First, data on demographic, socioeconomic, and housing market characteristics for single-family neighborhoods in the 100 largest urban regions will be collected from the U.S. Census and American Community Survey during three time periods: 2005 to 2007, 2008 to 2010, and 2012 to 2016. Descriptive statistics and econometric modeling will be used to determine how the characteristics of neighborhoods that experienced growth in single-family rentals differed from neighborhoods that did not experience growth in single-family rentals over the study period. Particular attention will be paid to differences among communities experiencing short- and long-term rental opportunities. Second, content on single-family neighborhoods experiencing growth in rentals will be purposively sampled from diverse media during the study period. Qualitative content analysis will be used to understand how the growth and endurance of single-family rentals has affected neighborhood dynamics. The findings from the analyses will be triangulated to draw conclusions on the neighborhood geography, characteristics, and effects of single-family rentals and identify possible roles for planners.

MAKING SENSE OF THE SUDDEN RISE OF SINGLE-FAMILY RENTALS SINCE THE GREAT RECESSION

Abstract ID: 179

Group Submission: Single Family Rentals: Trends, Impacts, and Planning Implications

WEGMANN, Jake [University of Texas at Austin] jagw@utexas.edu, presenting author

PFEIFFER, Deirdre [Arizona State University] , co-author

SCHAFFRAN, Alex [University of Leeds] A.Schaffran@leeds.ac.uk, co-author

The classic image of the American Dream is a nuclear family that owns the single-family house it occupies. The single-family rental (SFR) is thus an odd hybrid—it encompasses the housing type that lies at the apex of aspiration in the United States even as its occupants lack the ownership tenure with which it is traditionally

conflated. Single-family renters may thus gain some of the American Dream—ample physical space, a quiet street away from heavy traffic, and (depending on location) access to high-quality public amenities. However, they lack the security of tenure and wealth-building potential long seen as foundational to the American Dream, and in certain locations they may actually enjoy fewer legal protections than other types of renters.

The SFR is nothing new, but its share of the housing stock surged dramatically in the wake of the Great Recession (Drew, 2015). As the economic recovery has unfolded over the past decade, SFRs have not dwindled to their pre-2008 levels. Instead, and considering that many observers expect homeownership rates to drop in coming decades (cf. Nelson, 2016), we might predict that SFRs are here to stay. These trends suggest a fundamental question: are SFRs an “unexpected opportunity” that emerged from the Great Recession (Pfeiffer and Lucio, 2015)? Or are they a dead end and possible trap for the millions of households that have moved into them in recent years?

Scholars have begun to answer these questions, providing basic profiles of the phenomenon (Drew, 2015; Goodman and Kaul, 2017). Others have described the rapid evolutions in capital markets, property management, and information technology that have allowed large institutional investors, perceiving an opportunity in the foreclosure crisis, to play an outsized role in owning a rental housing format that they shunned until a short time ago (Allen et. al, 2017). Our contribution is to further the exploratory task by posing basic questions: in what types of places have SFRs surged the fastest since the Great Recession? What types of people live in them? And what are the emergent media narratives surrounding them? We believe that these questions are essential to both identifying the policies needed to grapple with the SFR phenomenon, and the political constraints that will shape them.

To answer these questions, we deploy two basic methods. First, we analyze Census-reported microdata within Public Use Microdata Areas (PUMAs), home to about 100,000 people apiece, spanning the nation. Second, we conduct a media analysis of purposively sampled content from US-focused traditional news outlets, advocacy and professional organization publications, and relevant social media dating back a decade to the Great Recession. We then analyze the extent to which emergent narratives either reinforce the geographic and sociodemographic patterns unearthed from our microdata analysis, or else contribute to stereotypes that are not borne out by actual data.

Our results thus far suggest that SFR renters are, on the whole, slightly less vulnerable than the renter population overall, although they resemble the broader renter population far more than single-family owner occupiers. SFR households’ most distinguishing feature is their large household size and share with children—according to both of these indicators, they exceed the general rental population, the renter population in 2-4 unit housing, and, by a wide margin, even owner-occupants of single-family houses. Thus, our results suggest that SFRs amount to an accidental housing policy that is now playing an outsized role in housing a subcategory of renters with particular constraints: those raising children.

Our continuing work on the media analysis will pay particular attention to this noteworthy finding, and relate it to other emergent themes shaped by media coverage of SFRs.

ESTIMATING THE GAP IN AFFORDABLE AND AVAILABLE RENTAL UNITS FOR FAMILIES

Abstract ID: 180

AIRGOOD-OBRYCKI, Whitney [Harvard University] whitney_airgood-obrycki@harvard.edu, presenting author
MOLINSKY, Jennifer [Harvard University] jennifer_molinsky@harvard.edu, co-author

Migration and development trends over the last decade have challenged the availability of rental housing suitable for families. Millennials and baby boomers have returned to urban neighborhoods in the back to the cities movement and outbid moderate-income families for large units. At the same time, new rental construction in cities and suburbs primarily consists of higher-end units. Conversions of single-family homes have contributed to the rental supply but may be affordable only to higher-income households. Municipal officials witnessing these dynamics have expressed concern that middle- and low-income families are not able to find suitable housing at a price they can afford. Meanwhile, a higher share of renter households than owner households have children, pointing to a need for units that can accommodate families.

Families contribute to the economic health of cities (Reese, 2012). It is important to plan for families as a mechanism to retain young professionals as they move through the life cycle and start to have children (Warner & Rukus, 2013). Planners have noted that families promote community sustainability and diversity, but they have identified the lack of affordable housing as the biggest barrier to creating family friendly communities (Israel & Warner, 2008). To attract middle-class families and provide geographic options to low-income families, cities and suburbs must have a supply of adequate, affordable, and available rental housing. This paper asks whether there is a sufficient number of units to meet the demand of renter families at all income levels and what role single-family houses play in providing affordable, family-sized rental units.

We use the 2015 American Community Survey Public Use Microdata Samples to examine the potential gap in the supply of rental units suitable for families with children. We define family households as those in which any children under the age of 18 are present. Using HUD's reported median incomes, we estimate the number of family households that fall within each area median income band in 358 metropolitan areas. For each household, we determine the number of bedrooms needed by using HUD's Keating standard of two persons per bedroom. We calculate the number of units in each metro that are affordable within each income band, that are not occupied by a non-family or higher-income household, and that are adequately sized for a family household. We estimate the supply gap at the national level and for select metropolitan areas by taking the difference between the number of renters - accounting for household size and AMI - and the number of affordable, available, and adequate units.

We find that the family-sized housing supply gap is largest for extremely low-income (ELI) renters. While 3.1 million ELI renter households live in our sample metros, only 666,000 affordable units are available to meet this demand. Two-bedroom units are in particularly short supply, with more than five ELI families for every affordable, available two-bedroom unit. We find that single-family houses are an important supply of rental housing for higher-income families. However, the largest gaps in the market are among low-income households, and these single-family units are generally not affordable to them. For planners, the findings highlight the need to increase the low-income rental supply and provide assistance for households in the private market in an effort to build family-friendly communities.

PRE-ORGANIZED SESSION SUMMARY

BUILD BABY BUILD: ASSESSING THE IMPACT OF NEW HOUSING DEVELOPMENT ON AFFORDABILITY AND DISPLACEMENT

Summary ID: 15

Abstract ID: 140

Abstract ID: 141

Abstract ID: 142

Abstract ID: 143

Abstract ID: 144

The ongoing crisis of housing affordability in high cost cities has placed renewed focus on both the constraints to and impacts of housing development as a supply side solution to the problem. Elected officials, planners and advocates are engaging in political debates over the role and impact of housing development on communities. In response to these debates, a new wave of research is investigating the neighborhood effects of market-rate housing development. This session will present new methods and finding from across the country about the impacts of new market rate housing production on housing affordability, neighborhood change, and displacement pressures.

Objectives:

- Learn about advancements in methodologies and findings on the affordability and displacement impacts of housing development

Abstract ID: 140

Group Submission: Build Baby Build: Assessing the impact of new housing development on affordability and displacement

ZUK, Miriam [UC Berkeley] mzuk@berkeley.edu, presenting author

CHAPPLE, Karen [University of California Berkeley] chapple@berkeley.edu, co-author

A growing movement of supply-side activists, known as YIMBYs (for “Yes In My Back Yard”) argue for increasing the production of market rate housing as a solution to the housing affordability crisis in California (McCormick 2018). Simultaneously, anti-displacement activists, or “supply skeptics” as coined by Been and coauthors (Forthcoming), argue that investment in market rate housing in the high-cost state will only accelerate displacement pressures and do nothing for low income households in nearby neighborhoods. Research for either side is limited, however there is both evidence that supply lowers median rents (Been, Ellen, and O’Reagan Forthcoming) and that infill may have spillover price effects (Brunes et al. 2016; Ooi and Le 2013), exacerbating the cost burden of low income households (Zuk and Chapple 2016). This study seeks to fill this research gap in one of the costliest and politically volatile environments in the country: the San Francisco Bay Area. In this study, we combine county tax assessor data with credit score, transaction, and census data to begin to understand the relationship between market rate multi-family housing production, affordability and displacement for high cost regions. Using a difference in difference approach, our preliminary findings suggest that effects vary significantly by geography, building type, and affordability level. This then suggests that current one-size-fits-all approaches will fall short in mitigating negative impacts, particularly in jurisdictions lacking renter and affordability protections.

WHEN THE NEIGHBORHOOD GOES: THE EFFECTS OF GENTRIFICATION ON INDIVIDUALS AND COMMUNITIES

Abstract ID: 141

Group Submission: Build Baby Build: Assessing the impact of new housing development on affordability and displacement

ARON-DINE, Shifrah [Stanford] shifrah.arondine@gmail.com, co-author
BUNTEN, Devin [MIT] devinbunten@gmail.com, presenting author

We develop and test a new dynamic framework to understand gentrification and use this framework to study open empirical questions. We identify gentrifiable neighborhoods as those that (i) have attractive exogenous features and (ii) are occupied by low-income residents. When a neighborhood gentrifies, forward-looking house prices should rise in advance of income. We classify gentrifiable neighborhoods as at-risk of impending gentrification if house prices have risen well above incomes, and then document that at-risk neighborhoods see future demographic change consistent with gentrification. We then turn to the open empirical questions. First, we provide evidence that at-risk neighborhoods experience higher rates of out-migration, consistent with displacement. We show that housing construction within at-risk tracts is correlated with higher out-migration, but construction nearby at-risk tracts is correlated with lower out-migration. We also show that out-migration rates are elevated for both likely renters and likely homeowners, although the processes inducing these moves may be different. Finally, we highlight the potential costs beyond displacement that are felt by whole communities--in particular low-income communities and communities of color--when gentrification restricts access to central job-rich transit-oriented neighborhoods.

NEW HOUSING DEVELOPMENT AND NEIGHBORHOOD CHANGE IN LOS ANGELES

Abstract ID: 142

Group Submission: Build Baby Build: Assessing the impact of new housing development on affordability and displacement

MONKKONEN, Paavo [UCLA] paavo.monkkonen@ucla.edu, presenting author
LENS, Michael [University of California Los Angeles] mlens@ucla.edu, co-author

Existing research shows that metropolitan regions with more elastic housing supply have lower increases in rents and housing prices with population and economic growth. However, there is significant disagreement in most metropolitan areas as to where that housing should be built, with most neighborhoods resisting it be built within their borders. Traditionally, community groups opposed new housing construction in their neighborhood because of concerns that building new multi-family housing would lead to lower housing prices. Recently, community groups in neighborhoods experiencing or facing the prospect of gentrification are concerned that new multi-family housing will lead to higher rents, thus displacing families that cannot keep up with rent increases. This discussion is a challenge because there is surprisingly little empirical evidence on the relationship between new housing supply and neighborhood change. In this paper, we bring available evidence to bear on the relationship between new construction and neighborhood change for the County of Los Angeles. Using Census and administrative data, we analyze where new housing is added, and how neighborhoods that add new housing change, in terms of the incomes, educational attainment, and other characteristics of their residents, as well as evictions and changes in the composition of neighborhood schools.

NEW HOUSING DEVELOPMENT IN NEW YORK CITY

Abstract ID: 143

Group Submission: Build Baby Build: Assessing the impact of new housing development on affordability and displacement

LI, Xiaodi [New York University] xl1060@nyu.edu, presenting author
ELLEN, Ingrid [New York University] , co-author

New housing development is important for keeping housing affordable, because a lack of supply to meet increasing demand makes housing more expensive (Glaeser and Gyourko, 2003). However, affordable housing advocates and community members fear that new luxury housing will replace older, more affordable units, and that new developments will attract high-income households, trigger gentrification, and drive up the housing price (Been, Ellen, and O'Regan, 2018; Bachrach, Monkkonen, and Lens, 2018). This paper provides a detailed look at new housing development in New York City from 2006 to 2015. We analyze how density and price of new housing compare to surrounding neighborhoods and examine whether higher priced developments are concentrated in areas with high or rising prices.

First, we will merge certificates of occupancy with NYC Furman Center subsidized housing database to learn how many new developments are subsidized? What kinds of programs? Who could benefit from these subsidized housing? Second, we will merge certificates of occupancy with NYC PLUTO data, we aim to describe and compare the characteristics (building classes, number of floors, etc) of the new developments to surrounding residential properties. Third, we will merge certificates of occupancy with housing sales price and rental income information from NYC Department of Finance. We'll compare housing prices of new developments with other

properties in their neighborhoods (Boro-Block, Zipcode, and Community District). We aim to figure out whether all new developments are more expensive than the median housing prices of their neighborhoods.

Based on the above analysis, we will analyze the locational distribution of new developments and examine whether high-priced developments are being created throughout the city or whether they are concentrated in particular neighborhoods. Using American Census Survey (ACS) 2006-2010 and 2011-2015 five-year estimates, we will learn whether new developments “select” into gentrifying neighborhoods.

LOCAL EFFECTS OF NEW CONSTRUCTION ON EXISTING RENTS: AN ANALYSIS OF MINNEAPOLIS, MN

Abstract ID: 144

Group Submission: Build Baby Build: Assessing the impact of new housing development on affordability and displacement

DAMIANO, Anthony [University of Minnesota] damia025@umn.edu, presenting author

Many US metropolitan areas are experiencing a severe housing affordability crisis which has resulted in high housing cost-burdens and has contributed to displacement pressure for low-income residents. In part due to the lack of federal support for affordable housing programs, there is growing interest in using new market rate production as a mechanism to improve housing affordability and prevent displacement. There is compelling evidence that increasing housing supply at the regional level results in greater housing affordability. However, less is understood about the neighborhood-level effects of building new market rate housing on nearby rents. What effects, especially in the short term, do new market-rate construction have on housing affordability for existing tenants?

There are two hypothesized, but countervailing local effects of new market rate housing construction on rents in existing buildings:

1. The supply effect: The additional housing contributes to the total supply of housing, reducing competition for units which results in lower rents for existing tenants.
2. Amenity effect: New, market-rate construction creates a positive externality due to the fact that individuals are willing to pay more to live near wealthy households all else being equal.

My data include a panel of unit-level rent data for the city of Minneapolis, MN between 2012-2017. I combine that dataset with data on public and private real estate investment as well as new construction. My analysis will include a spatial difference-in-difference (SDID) model in order to identify local spatial spillover effects of new construction after controlling for other time-varying factors.

PRE-ORGANIZED SESSION SUMMARY

PLANNING AND HOUSING AFFORDABILITY - SPACES OF STRUGGLE

Summary ID: 16

Abstract ID: 112

Abstract ID: 113

Abstract ID: 114

Abstract ID: 163

Abstract ID 1362

Whether through zoning, development control, programs for affordable housing, or lack thereof, planning practice interacts with geographies of housing to impact affordability. This session brings together research that explores these issues from different perspectives and places, touching on housing type, tenure, cost, location, development, and displacement. The papers grapple with adverse impacts of planning on affordability, the tensions between housing as a place to live and as a vehicle for (re)investment, and suggest strategies for securing housing as a public good. In contradictory and complex ways, these papers trace topographies of policy and practice and how they connect to the economics of home in New York City, Boston, Seattle, Madison, London and Toronto.

Objectives:

- how planning impacts housing affordability

CHAIN DISPLACEMENT: AN EMPIRICAL INVESTIGATION IN DANE COUNTY, WISCONSIN

Abstract ID: 112

Group Submission: Planning and Housing Affordability - Spaces of Struggle

SIMS, Revel [University of Wisconsin - Madison] revel.sims@gmail.com, presenting author

While much attention has been given to Marcuse's (1985) typology of displacement, few empirical tests have been carried out on the more challenging categories among the four he originally proposed. Marcuse's typology is characterized by a movement from the most readily observable form of displacement—"last-resident displacement"—to increasingly less measurable forms of "exclusionary" displacement and "displacement pressure." Thus while the overall typology weighs heavily toward demographic transition, Marcuse also included a possibly contradictory form of displacement—"chain displacement"—that suggests a form of non- or pre-gentrification displacement without demographic change. This possibility was meant to draw attention to the seemingly paradoxical juxtaposition of gentrification and abandonment in the late 1970s and early 1980s. This paper offers the first empirical investigation of Marcuse's notion of chain displacement. Using geocoded data from sixteen years of eviction records in Dane County Wisconsin, the research first demonstrates the existence of eviction-based displacement neighborhoods. These neighborhoods—operationalized as block groups—are not only sites of disproportionate evictions, but also exhibit persistent forms of disadvantage and relative demographic "stability" rather than transition. The paper argues that a key mechanism behind the formation of chain displacement neighborhoods is the Wisconsin Consolidated Court Automation Program (CCAP) which provides free and easy access to civil and criminal court records. We contend that CCAP effectively functions to limit renters' housing options and negatively impacts tenants with previous eviction records, thus constraining

them in eviction-based displacement neighborhoods in a type of displacement that resembles Marcuse's notion of chain displacement.

DOES INCLUSIONARY HOUSING PROMOTE SOCIAL MIX?

Abstract ID: 113

Group Submission: Planning and Housing Affordability - Spaces of Struggle

LI, Fei [Georgia State University] fei.li@nyu.edu, presenting author

GUO, Zhan [New York University] , co-author

The spatial distribution of subsidized or affordable housing can be an important factor that shapes the (de)concentration of urban poor and minorities (Bolt, Phillips & Van Kempen, 2010; Kontokosta, 2014; Massey & Kanaiaupuni, 1993), which may in turn affect the well-being of affordable housing beneficiaries (Galster, 2012). Inclusionary housing policies, which require private, market-rate housing developments to include a portion of affordable units, often aim at not only creating affordable homes, but also mixed and inclusive communities. This study examines the effectiveness of such strategy in London, where inclusionary housing has become a major source of new affordable homes since 2000 (Crook et al., 2006). It seeks to answer two research questions: 1) Are affordable units delivered under inclusionary housing more spatially dispersed than those produced by the public sector? 2) Is the on-site inclusion of affordable housing units among market-rate developments related to neighborhood characteristics? In other words, do developers disproportionately provide affordable housing in poor, disadvantaged, segregated neighborhoods, or does inclusionary housing successfully enhance the residential options of low income families by delivering more affordable homes in high opportunity areas with better labor market, education, and quality of life outcomes?

We examine the spatial distribution using the London Development Database, which contains all residential development permits issued between 2004 and 2014. Among them are 1,293 mixed developments under inclusionary housing, offering about 75,000 affordable homes. While inclusionary housing developments include an average 33% of affordable housing on-site, the affordable share varies across individual sites. We find that affordable homes delivered under inclusionary housing are more geographically concentrated than either market-rate homes or homes in conventional, public sector affordable housing developments. 85% of the inclusionary affordable units are located in 20% of all neighborhoods, as opposed to 73% of the conventional affordable units or 65% of the market-rate units.

We believe the concentrated and uneven distribution of affordable homes delivered under inclusionary housing may reflect both the cherry-picking practice of developers, who often have an incentive to undersupply affordable housing in the most desirable locations, and the trade-off of local planning authorities, who may prioritize providing new housing in the jurisdiction over social mix or inclusive development. We then adopt a zero-inflated regression model to test these hypotheses, using principal component analysis to derive primary neighborhood characteristics. The results suggest that market-rate developments are more likely to include affordable housing on-site – and tend to have higher affordable shares when they do so – if they are located in neighborhoods with higher poverty and unemployment rates, more minorities, lower income levels and housing values, and a greater

concentration of existing public housing. Local policy agenda (the annual target for new housing production) and political landscape (Labour vs. Conservative) only partly explain the strong linkage between neighborhood characteristics and the on-site inclusion of affordable housing.

These findings raise sharp questions about the role of inclusionary housing in promoting social mix and mitigating economic and ethnic segregation. The first to evaluate the development-level performance of a large scale inclusionary housing program, this study lends valuable insights into the heated policy debate on inclusionary housing and mixed-income housing development. We urge policymakers, planners and researchers to revisit an important objective of inclusionary housing policies – to create mixed, inclusive communities – and reexamine the design and implementation of these policies so they are tailored towards providing better housing options for low-income households.

NEGOTIATED DEVELOPMENTS: USING ZONING AND ENTITLEMENT POWER AS LEVERAGE TO ADDRESS HOUSING AFFORDABILITY

Abstract ID: 114

Group Submission: Planning and Housing Affordability - Spaces of Struggle

KIM, Minjee [Massachusetts Institution of Technology] minjeek@mit.edu, presenting author

This paper analyzes the merits and drawbacks of negotiating zoning on a project-by-project basis vis-à-vis the traditional command-and-control zoning system. I compare the experience of two major U.S. cities, Boston and Seattle, using data on development projects approved in 2016. These two cities represent two opposing styles of land use regulation. In Boston, most, if not all, large-scale developments need to be negotiated with city officials and the community to secure development rights, whereas Seattle's zoning is incentive-based and leaves little room for negotiation.

In both Boston and Seattle, I have compiled development data of all projects over 50,000 square feet that secured development entitlement during the year of 2016. I have also conducted interviews with the conclusions drawn from the analysis of the development data.

Compared to projects approved under Seattle's definitive zoning system, Boston's negotiated developments yielded greater public benefit packages, including the contribution towards the production and preservation of the city's affordable housing stock. Moreover, Boston's projects took less time to secure approval and incorporated numerous and substantive public participation opportunities. Based on these findings, I argue that negotiating zoning for large-scale developments can become a valuable planning tool for local governments, and that common pitfalls of negotiating zoning can be avoided.

WHATEVER THE PROBLEM, THE SOLUTION IS LUXURY DEVELOPMENT: NEW YORK CITY'S 21ST CENTURY PLANNING PARADIGM

Abstract ID: 163

Group Submission: Planning and Housing Affordability - Spaces of Struggle

STEIN, Samuel [CUNY Graduate Center] sstein@gradcenter.cuny.edu, presenting author

Since 2001, the US' largest city has been governed by two very different politicians. From 2001 through 2013, New York City's mayor was Michael Bloomberg, a finance and media mogul who advanced an unrepentantly neoliberal agenda (Brash, 2011; Larson, 2013). Since 2014, the mayor has been Bill de Blasio, a former democratic socialist who presents himself as a representative of the country's progressive vanguard (Viteritti, 2017; González, 2017). While in many ways these two could not be more different, this paper asks: what are the continuities between their approaches to planning and development? Through a historical analysis of their policy initiatives, I find that: both have pursued controversial rezonings in working class, majority people of color neighborhoods; both have maintained close ties with the Real Estate Board of New York, the city's primary developer lobby; and, most importantly, both have subscribed to the same planning philosophy: whatever the problem facing their city, the solution—in part or in whole—is more luxury development. Whether it be rising rents, widening public housing budget gaps, unemployment, insufficient transit, demands for new parks, environmental pollution, failing schools, segregation, or a desire to support the arts, both conservative Michael Bloomberg and liberal Bill de Blasio have pursued real estate-driven strategies to address urban crises of all sorts. This paper will provide an overview of the ways New York City urban planning has come to be dominated by real estate in a manner that seems to stretch beyond partisan politics and suggest something more fundamental about our 21st century urban political economy. It thus makes interventions into both the scholarly and practical debates around progressive mayors, neoliberal planning, and the implications of current trends toward hyper-investment in land (Weber, 2015) on the meaning and practice of urban planning.

GENTRIFICATION-INDUCED DISPLACEMENT IN DETROIT: PERSPECTIVES FROM BELOW

Abstract ID: 1362

Group Submission: Planning and Housing Affordability - Spaces of Struggle

Gentrification-induced displacement has long been a topic studied and hotly debated in scholarly and in policy-making circles for decades. Yet, despite the amount of research that has been generated, the magnitude of the association to gentrification remains uncertain and subject to polarizing debate. This could be due to methodological challenges with measuring displacement. For one, it is difficult to locate displaced households because “by definition, displaced residents have disappeared from the very places where researchers go to look for them” (Newman & Wyly, 2006: 27). To address this issue, some quantitative studies have relied on census data to infer displacement, which is problematic, as it does not directly measure displacement (Atkinson, 2002), and does not take into account indirect displacement (Davidson, 2008).

Moreover, despite the large body of literature, some scholars (e.g. Davidson, 2008) argue that displacement processes are still not well understood and have been undertheorized given that direct last-resident displacement is often the focus of researchers, leaving indirect displacement pressures relatively under-examined. However, indirect displacement holds serious implications for planning initiatives that seek ‘revitalization without displacement’, as these initiatives only address physical dislocation. As displacement pressure (Marcuse, 1985) occurs, existing neighborhood stores, restaurants and services may close or change to cater to the tastes of new higher-income residents, which can lead to a significant loss of sense of place for low-income households (Shaw & Hagemans, 2015).

This research contributes to the growing body of qualitative research that explores indirect displacement and helps to inform planning practice by examining direct and indirect displacement experiences in a resurgent U.S. shrinking city. This paper uses Detroit as a case study to examine the displacement effects of recent regeneration initiatives by using evictions data as a proxy for direct displacement and by exploring tenant experiences with indirect displacement in a changing downtown. By documenting the lived experiences of subsidized tenants living in a rapidly gentrifying neighborhood, planners can obtain a better understanding of tenant perspectives, which might help them to develop more effective social planning interventions that address social exclusion and can help build more socially cohesive and just communities.

The research investigates the following central research question: What are the displacement impacts of regeneration initiatives in Detroit? To address this question, this study employs a mixed methods research approach to understand the extent of direct and indirect displacement in downtown Detroit. The quantitative component draws upon a spatial analysis of evictions based on court records of eviction proceedings in Detroit. I also used GeoLytics Neighborhood Change Database Tract Data and American Community Survey data to identify census tracts within the city that showed signs of gentrification based on an aggregated measure that looked at relative increases in rent, income, home values and share of college-educated residents and professionals (1990-2015). The qualitative component is based on semi-structured key informant interviews with: tenants living under displacement pressure; housing and community workers; tenant organizers; and community development financial professionals.

Initial findings suggest that subsidized tenants have experienced displacement pressure, as the shops they once frequented slowly disappear and they feel excluded from the neighborhood changes that are occurring. Further, they no longer feel a sense of belonging in their neighborhood, continue to have fears of displacement despite assurances that their respective subsidized building will not be converted to market-rate housing, and there are feelings of resentment, which illustrate the tensions between ‘old’ and ‘new’ Detroit.

PRE-ORGANIZED SESSION SUMMARY THE FAIR HOUSING ACT AT 50

Summary ID: 20

Abstract ID: 310

Abstract ID: 311

Abstract ID: 312

Abstract ID: 318

One week after Martin Luther King Jr.'s assassination in 1968, Congress passed the Fair Housing Act, prohibiting discrimination on the basis of race, religion, national origin, or sex, in the sale or rental of a home. Leading up to the Act's 50th anniversary, it has received increasing attention. In 2015, HUD created the Affirmatively Furthering Fair Housing Rule to clarify what municipalities must do to address disparities in housing needs and in access to opportunity. The Supreme Court in 2015 and 2017 decided cases affirming the reach of the Act to cover claims based on disparate impact and to encompass claims by municipalities. Then, in January 2018, HUD suspended the AFFH Rule. And in March, HUD rewrote its mission statement to remove the explicit anti-discrimination commitment. Levels of residential segregation by race remain high, racial disparities in homeownership rates are wide, some are describing restricted access to mortgage financing as a new wave of redlining, and predatory contract buying schemes are on the rise. The papers on this panel explore various aspects of the state of fair housing today.

Objectives:

- To analyze the state of fair housing today.
- To understand reasons for continuing high levels of segregation, and racial disparities in home financing and homeownership rates.
- To better understand policy responses to continuing racial disparities in neighborhoods.

GENTRIFICATION AND FAIR HOUSING: DOES GENTRIFICATION HINDER OR FOSTER INTEGRATION?

Abstract ID: 310

Group Submission: The Fair Housing Act at 50

ELLEN, Ingrid [NYU] ingrid.ellen@nyu.edu, presenting author

TORRATS-ESPINOSA, Gerard [New York University] gerardtorrats@gmail.com, co-author

In cities throughout the United States, the pace of gentrification has accelerated in the past two decades (Ellen and Ding, 2017), and debates around the appropriate policy response have intensified. Many critics demand that governments take actions to slow the pace of change, charging that this gentrification leads to displacement and resegregation. But at least in the short-run, gentrification increases economic integration, and often furthers racial and ethnic integration as well, as affluent white households opt for diverse, city neighborhoods over high-income, racially homogenous suburbs. The key question is whether this integration is only fleeting, or whether cities experiencing greater gentrification end up with more economically and racially integrated neighborhoods over time. Yet there is surprisingly little research examining the longer-run trajectory of neighborhoods experiencing gentrification, so fair housing advocates are left to speculate.

We aim to fill this gap. Using the Neighborhood Change Database (NCDB), we examine the long-run dynamics of neighborhoods that undergo gentrification (defined as an increase in income, percentage college-educated, or percentage white). We show the degree to which gentrification in U.S. cities in one decade has led to stable economic and racial integration in subsequent decades, and in what contexts. In brief, we find that the integration produced by gentrification is considerably more stable than many think, but the rising rents that accompany it mean that lower-income households, absent subsidies, will likely find it increasingly difficult to move in and remain in gentrifying neighborhoods over time.

With these stylized facts as background, we consider implications for fair housing, and weigh a set of policy interventions. Most policy discussions surrounding gentrification center on efforts to protect individual residents at risk of displacement through legal representation or tenant-based vouchers. Yet while these efforts can be critical in helping individual tenants, they will do little over the longer run to preserve economic and racial diversity, which are shaped much more by the composition of people moving into a neighborhood than by the pattern of exits. Thus we also consider a set of policies that can help to make gentrifying neighborhoods more inclusive, or more welcoming to a diverse set of households over the longer-run, including the place-based subsidized housing investments that fair housing advocates have traditionally scorned.

JORDAN, Reed [Massachusetts Institute of Technology] reedj@mit.edu, co-author
WOLUCHEM, Maia [Massachusetts Institute of Technology] woluchem@mit.edu, co-author

The Department of Housing and Urban Development's 2015 Affirmatively Furthering Fair Housing Rule requires municipalities to formulate new plans to address obstacles to fair housing and disparities in access to opportunity. Although the rule provides a more rigorous structure for plan compliance than previous regimes, as a form of meta-regulation, it still gives substantial flexibility to localities. Are municipalities creating more robust fair housing plans under the new rule, and what types of municipalities are creating more rigorous goals? Analyzing the goals in all of the plans submitted before HUD suspended the rule in January 2018, we find that municipalities propose significantly more robust goals under the new rule than they did previously.

MULTIDIMENSIONAL DISCRIMINATION IN THE ONLINE RENTAL HOUSING MARKET: IMPLICATIONS FOR FAMILIES WITH YOUNG CHILDREN

Abstract ID: 312

Group Submission: The Fair Housing Act at 50

FABER, Jacob [New York University] jacob.faber@nyu.edu, presenting author

MERCIER, Marie [New York University] mm6262@nyu.edu, co-author

Despite the existence of federal, state, and local fair housing laws, studies have consistently documented continued discrimination against home seekers on the basis of race and familial status (Pager and Shepherd 2008; Oh and Yinger 2015). Although overt forms of racial discrimination have declined since the passage of the Fair Housing Act, more subtle forms of discrimination still persist (Massey 2005). Practices such as racial steering and information withholding reinforce segregation by limiting residential mobility and exacerbate racial wealth gaps by restricting the ability of minorities to accumulate home equity.

The current study is a field experiment to analyze whether discrimination on the basis of race, family structure (i.e. the presence of children and marital status), and/or receipt of a housing voucher (i.e. Section 8) shapes disparate outcomes among families in the online rental housing market in 30 large cities in the United States. The project enhances scholarship on race, family, and segregation by examining a potential mechanism through which spatial and racial inequalities manifest: limited housing mobility due to discrimination. Importantly, because we systematically assess discrimination against voucher recipients, our findings will have direct policy implications as we will assess the efficacy of state and municipal policies intended to protect voucher holders from discrimination. Although studies have investigated discrimination along one or two dimensions of potential disadvantage, no prior work has simultaneously measured what we propose. This gap in the literature leaves unanswered questions about efficacy and equity in policy implementation for households potentially facing multidimensional discrimination. Furthermore, it is crucial to understand heterogeneity in how voucher recipients experience the search for housing.

More broadly, these concerns are key to understanding whether and how multidimensional discrimination manifests to harm families with children (Rosenblatt and DeLuca 2012). Because one of the primary means of improving the life chances of one's children is moving to a safe neighborhood with rising home values and quality schools, housing discrimination constitutes an important barrier to social mobility. Therefore, developing an intersectional understanding of bias in the housing market will contribute to theories of race, family, and economic status by empirically linking discrimination originating from each identifying characteristic and evaluating the ways in which the real, lived experiences of competing privileges and disadvantages—often evaluated independently in empirical work—shape disparate outcomes.

Consistent with prior audit studies, results show substantial discrimination against racial minorities, who receive fewer responses from landlords. Family structure also plays a role in shaping discriminatory patterns, as signaling the presence of a husband decreases response rates, while signaling the presence of children increases response rates. Importantly, this study shows that racial disadvantage is compounded by signaling housing voucher receipt, which raises serious concerns about the role of this policy in exacerbating residential segregation and housing opportunity more broadly.

WHAT'S FAIR? WHERE'S FAIR? THE GEOGRAPHY OF METROPOLITAN FAIR HOUSING CHOICE IN CHICAGO

Abstract ID: 318

Group Submission: The Fair Housing Act at 50

GREENLEE, Andrew [University of Illinois at Urbana-Champaign] agreen4@illinois.edu, presenting author

The 1968 Fair Housing Act prohibits discrimination in the sale, rental, and financing of dwellings, and in other real estate-related transactions because of race, color, religion, sex, familial status, national origin, or disability. The Act requires that HUD administer programs and activities relating to housing and urban development in a manner that affirmatively furthers the policies of the Act. The affirmatively furthering mandate of the Act requires the recipients of federal funds to do more than simply not discriminate - recipients also must address segregation and other outcomes of processes driving housing inequity.

On July 16, 2015, the U.S. Department of Housing and Urban Development (HUD) published a final rule on Affirmatively Furthering Fair Housing to create a unified externally monitored and enforced framework. The AFFH rule discusses fair housing choice as follows: "Fair housing choice encompasses (1) actual choice, which means the existence of realistic housing options; (2) protected choice, which means housing that can be accessed without discrimination; and (3) enabled choice, which means realistic access to sufficient information regarding options so that any choice is informed." (AFFH Rule Guidebook, 2015).

This paper jointly examines the geography of existing fair housing choice and patterns of residential mobility within and between neighborhoods that exhibit different levels of fairness. Using the Chicago metropolitan area as a case study, I illustrate the interdependence between neighborhoods based upon their fair housing choice attributes and the qualities of residential mobility flows between the neighborhoods. I use this joint analysis as a means of classifying existing patterns of mobility in relationship to fair housing choice, and also to highlight how interdependence between neighborhoods may influence or complicate the pursuit of localized interventions to address spatial imbalances in fair housing.

To conduct this analysis, I rely upon several sources of information. My analysis of the existing geography of fair housing choice relies on the suite of neighborhood-level fair housing indicators produced by HUD. I describe the geography of fairness in two ways – first by mapping out the unique combination of neighborhood-level attributes within the region, and second, by analyzing the statistical relationships contained within the suite of indicators using exploratory factor analysis. The second major source of information which I use in this analysis is household-level data on residential mobility histories for more than 8 million households residing in the Chicago Metropolitan Statistical Area between the years 2006 and 2016. I transform these household-level data into a network of flows that describe residential mobility between neighborhoods within the region, as well as general demographic characteristics of movers and households who do not move over this time period.

The findings from my analysis have several important implications for the future of fair housing policy. First, my analysis of the geography of fairness reveals the need for analytical approaches that go beyond descriptive analysis of fair housing indicators. Understanding latent characteristic and mixes of fairness conditions help to produce a more nuanced map of fair housing choice that can in turn inform policy formation and deliberation. The second set of important implications come from the joint analysis of the geography of fairness with relationship to

residential mobility flows that connect the tapestry of neighborhoods within the region. The patterns revealed from these flows illustrate the interdependence between origin and destination neighborhoods as well as the potential for some neighborhoods to serve springboards to areas of opportunity and supportive conditions and for other neighborhoods to serve as traps within cycles of inequity and lack of fair housing choice.

PRE-ORGANIZED SESSION SUMMARY

MAPPING GENTRIFICATION AND DISPLACEMENT: APPLICATIONS AND APPROACHES

Summary ID: 21

Abstract ID: 342

Abstract ID: 343

Abstract ID: 344

Abstract ID: 345

Recent literature regarding gentrification and displacement pressure has focused on moving past descriptive historical accounts of these phenomena towards attempting to predict and verify neighborhood change, gentrification, and displacement in the imminent future. These methods build on past work on identifying gentrification, yet diverge in their methods for warning and future prediction. This session convenes researchers creating, adapting, and validating a diverse range of methods for mapping gentrification and displacement pressure.

Objectives:

- Understand different methods for analyzing gentrification and residential displacement
- Compare methods for validation and refinement of gentrification and displacement tracking

MAPPING GENTRIFICATION AND DISPLACEMENT PRESSURE: A COMPARATIVE ANALYSIS OF CURRENT METHODS ON BOSTON

Abstract ID: 342

Group Submission: Mapping Gentrification and Displacement: Applications and Approaches

PREIS, Benjamin [Massachusetts Institute of Technology] benpreis@mit.edu, presenting author
JANAKIRAMAN, Aarthi [Massachusetts Institute of Technology] ajanakir@mit.edu, co-author
BOB, Alex [Massachusetts Institute of Technology] abob@mit.edu, co-author

As reinvestment and declining affordability drive urban gentrification, cities face demands from long-time residents for protection from displacement and neighborhood change. While the type and degree of displacement that occurs due to gentrification has been a topic of debate within the literature, cities are nonetheless adapting

models developed within academia for the purpose of identifying neighborhoods that may be susceptible to gentrification and displacement. Cities are incorporating these analyses into strategic planning documents, as planning departments consider where to encourage commercial and residential development, in order to achieve equitable growth. With models for gentrification and displacement moving from theory to practice, it is of the utmost importance that the models used accurately represent the reality on the ground.

In this paper, we compare five gentrification and displacement risk models developed by and for the cities of Seattle; Los Angeles; Portland, Oregon; and Philadelphia and apply the methodologies to Boston. Seattle's Displacement Risk Index and Los Angeles's Index of Displacement Pressure are composed of expansive sets of demographic and spatial indicators to prospectively identify areas of their respective cities susceptible to displacement. The Displacement Risk Ratio, developed by The Reinvestment Fund and incorporated into Philadelphia's Assessment of Fair Housing, uses fewer indicators, providing a more straightforward method of analysis for displacement. Lisa Bates's Gentrification and Displacement Study, conducted for the City of Portland as a result of the City's commitment to anti-displacement planning under the 2012 "Portland Plan," builds on Lance Freeman's 2005 method for identifying gentrification in New York City primarily using demographic indicators from the census. Additionally, we include an analysis of gentrification developed by Lei Ding et al. from the Federal Reserve for identifying residential mobility in Philadelphia. Where robust descriptions of the methodologies were not publicly available, we worked with city staff to replicate their methods as closely as possible in order to apply the methodologies to the city of Boston.

In applying these five methods to Boston, we identify some geographic areas of agreement among them. However, even amongst the neighborhoods where the models agree, the degree of vulnerability deviates significantly in many cases. The use of racial or economic thresholds in some methodologies to exclude tracts presents a further challenge to the consistency across the models as some tracts that are excluded altogether in one model are identified as at high risk for gentrification related displacement in other models.

Our findings indicate the need for cities to critically consider the underlying assumptions of models included in policy documents, as thresholds and the choice of indicators may include or exclude neighborhoods in the liminal space of gentrification and displacement. This novel comparison of governmental analyses of gentrification provides insight as modeling moves from theory to practice.

MONITORING STREETS THROUGH TWEETS: USING USER-GENERATED GEOGRAPHIC INFORMATION TO PREDICT GENTRIFICATION AND DISPLACEMENT

Abstract ID: 343

Group Submission: Mapping Gentrification and Displacement: Applications and Approaches

CHAPPLE, Karen [University of California - Berkeley] chapple@berkeley.edu, presenting author

ZOOK, Matthew [University of Kentucky] zook@uky.edu, co-author

POORTHUIS, Ate [Singapore University of Technology & Design] ate_poorthuis@sutd.edu.sg, co-author

The overheating of the housing market, as well as the planning of new infrastructure systems, has led to new interest in understanding neighborhood change, specifically in the form of gentrification and displacement. Researchers have devised online “neighborhood early warning systems,” interactive maps that create typologies of neighborhood change and even predict future transformation, for instance using machine learning to assign gentrification risk to neighborhoods (Reades and Hubbard, forthcoming). Yet, the predictive power of these typologies has proven surprisingly poor, perhaps in part because they rely on census data that is out-of-date or unreliable at a fine geographic scale (Chapple and Zuk, 2016). Moreover, most analyses focus on gentrification rather than displacement, due to the greater availability of conventional data on gentrification (e.g., influx of capital and/or high-educated newcomers) than displacement (forced moves or exclusion).

Might real-time data on activity patterns improve the accuracy of these models by pinpointing the areas of dynamic change? For this paper, we develop typologies of neighborhood change from 2000 to 2016 for two regions: the San Francisco Bay Area and New York. From this analysis we identify areas which have not gentrified, but are considered at risk, based on loss of low-income households and increase in property values. Next, to validate and refine the models, we analyze geotagged tweets from 2012 to 2016, looking at both the extent to which outsiders spend time in at risk neighborhoods, and the transformation of home neighborhoods (based on the methodology in Shelton, Poorthuis, and Zook 2015). We expect to find that real-time geographic information refines and narrows the set of neighborhoods considered at risk for gentrification and displacement via conventional data. We conclude by exploring ways to represent neighborhood change on a more real-time basis and discussing the policy implications and implementation possibilities for smart cities.

GENTRIFICATION AND DISPLACEMENT: BRINGING COMMERCIAL AND RETAIL IN

Abstract ID: 344

Group Submission: Mapping Gentrification and Displacement: Applications and Approaches

SUNG, Seyoung [Portland State University] seyoung@pdx.edu, presenting author

BATES, Lisa [Portland State University] lkbates@pdx.edu, co-author

The neighborhood change typology map has been widely used to assess the risks of residential gentrification and displacement, but there has been less study on how commercial activity is associated with the neighborhood change mechanisms. Commercial gentrification may provoke indirect displacement pressures of vulnerable population groups by the loss of services which low-income incumbents rely on for their everyday life. The major concern of commercial gentrification is significantly related to changes in nearby communities, either stimulating or responding to residential demographic shifts (Chapple and Jacobus, 2009). One remarkable research (Chapple et al., 2017) proposed measures of the commercial gentrification and found that commercial gentrification may precede residential gentrification in the Bay Area and vice versa in the Los Angeles area.

The purpose of this research is not to elucidate the entangled relationship between residential and commercial gentrification (chicken-and-egg question). Rather, the research aims to suggest the new framework to examine gentrification and displacement risks comprehensively by incorporating commercial gentrification dimension into the previous neighborhood change typology by Bates (2013). The research questions are two-fold: How are the changes in commercial activity? Does the new typology with commercial gentrification better perform as predictors of gentrification and displacement risks?

The research examines the trajectory of neighborhoods' commercial activity in Portland, Ore. with particular focuses on commercial rents, vacancies, and shifts in businesses from 2010 to 2015 by utilizing CoStar, USPS Vacancy data, and NAICS code data. Next, the research analyzes how neighborhoods are rated differently by the previous method and the new method. This research will enlighten a discussion for the existing gentrification typology on the importance to take account of commercial gentrification for a comprehensive understanding of neighborhood change dynamics. We will also discuss both the contentious conceptual framework for understanding gentrification and displacement by linking residential and commercial gentrification and the limitations of data available for operationalizing the commercial gentrification fully.

THE EFFECTS OF GENTRIFICATION ON ORIGINAL NEIGHBORHOOD RESIDENTS: EVIDENCE FROM LONGITUDINAL CENSUS MICRODATA

Abstract ID: 345

Group Submission: Mapping Gentrification and Displacement: Applications and Approaches

BRUMMET, Quentin [NORC at the University of Chicago] brummet@gmail.com, co-author
REED, Davin [Federal Reserve Bank of Philadelphia] davin.reed@nyu.edu, presenting author

During the past two decades, college-educated and high-income households have increasingly located in urban neighborhoods. We use new longitudinal Census microdata to study the effects of this gentrification process on original neighborhood residents. We first develop a local labor markets model of gentrification, which yields two insights. First, gentrification's effect on original residents' observable well-being is approximated by its combined effects on their incomes, housing costs, commuting costs, and neighborhood amenities, regardless of whether they move or stay. Second, its effect on their unobservable well-being is proportional to its effect on out-migration. Uniquely, our data allow us to estimate these effects for tens of thousands of original residents of central city neighborhoods in all major metropolitan areas of the United States. We define gentrification as large increases in the number of college-educated individuals living in a neighborhood and employ various identification strategies to help address endogeneity from selection, omitted variables, and reverse causality. Our results suggest that gentrification may lead to small increases in original resident out-migration but that it has no effect on original resident employment, income, commuting distance, neighborhood quality, or rents paid and positive effects on original resident house values. Aggregating these estimates suggests that on average, gentrification benefits original resident homeowners and has little effect on the observed well-being of original resident renters. However, our results are consistent with well-being losses for original resident out-migrants if unobservable neighborhood preferences are strong.

PRE-ORGANIZED SESSION SUMMARY

PRIVATELY-OWNED RENTAL HOUSING IN THE US: CHANGES IN TENANT & OWNER BEHAVIOR

Summary ID: 29

Abstract ID: 569

Abstract ID: 570

Abstract ID: 571

Abstract ID: 572

Abstract ID: 573

This session will examine how the owners of the US rental stock and their tenants behave and how these behaviors have changed over time. Rising rentership rates and major changes in the ownership of rental properties make this topic timely. Most of the papers will focus on recent changes, but one paper will provide a historical perspective on a major federal program for privately owned rental housing to provide context to contemporary policy discussions.

Objectives:

- To understand recent and past changes in the behavior of tenants and landlords in the US

CREDIT, COMMUNITY, AND RISK

Abstract ID: 569

Group Submission: Privately-Owned Rental Housing in the US: Changes in Tenant & Owner Behavior

NELSON, Katharine [Bloustein School, Rutgers University] katharine.nelson@rutgers.edu, presenting author
 NEWMAN, Kathe [Rutgers, The State University of New Jersey] knewman@rutgers.edu, co-author

In this article we explore the cyclical nature of credit abundance and scarcity and how it shapes low-income and communities of color over time. Though one might expect communities that lack access to credit to benefit from credit expansions, in the 1970s, 1990s, and 2000s, an expansion of credit contributed to waves of foreclosures. Here we explore how sometimes credit is rationed leaving some people unable to access it and at other times it is overabundant creating a situation where those same people and or places are flooded with higher-risk loans and lending processes. To explore this duality, we look at the Federal Housing Administration (FHA) Section 235 lending in Philadelphia, PA in Newark, NJ during the late 1960s and 1970s and contrast it with the style of lending that layered risk through high-cost, nontraditional, and piggyback mortgage lending in the lead-up to the global financial crisis in the 2000s.

Though both periods had the potential to expand quality access to credit for those who lacked it in the past, neither did. Instead, the expansion of credit brought communities in touch with risky lending processes and products. We are particularly interested in the relationship between secondary market activity and the scale and quality of mortgage credit across urban neighborhoods. The centrality of the private label security (PLS) market in the growth of nonprime loans in the early 2000s is well known. Similarly, Bradford (1979) explains some of the effects of the 235 program as the result of an easy ability to sell the insured mortgage loans into the secondary market. We explore these experiences with differential access to credit through governmental hearings, testimony,

archival data, Home Mortgage Disclosure Act data, and foreclosure filings. We supplement our analysis with geographic data on historical property sales.

Redlining has often been framed as a lack of access to credit. But when it was named in the 1970s, the term reflected a differential access to credit. There was a bifurcated market with some communities who had access to conventional credit and others who had access primarily to FHA government-insured loans. Though FHA's Section 235 program was intended to increase access to credit for borrowers who lacked it in the past, the implementation of the program ran into a number of problems with speculators buying homes and selling them at inflated costs with excessively high home appraisals that went to foreclosure (Bratt 1976; Fox Gotham 2000).

SHARP RENT INCREASES & THE NATURALLY-OCCURRING AFFORDABLE STOCK

Abstract ID: 570

Group Submission: Privately-Owned Rental Housing in the US: Changes in Tenant & Owner Behavior

DECKER, Nathaniel [UC Berkeley] ndecker@berkeley.edu, presenting author

The US is currently in a rental affordability crisis that strains the finances of low- and moderate-income (LMI) renters and limits their access to opportunity neighborhoods. A number of signs suggest that this crisis would be even worse were it not for a large stock of unsubsidized rental units that are nevertheless below market rate, probably because they are not professionally managed. Some municipalities provide property tax abatements to landlords who keep rents below market rate. While existing scholarship suggests that implementation of a land-value taxation regime may improve rental affordability over the long term by inducing the generation of more housing, in the short term it should induce the owners of the unsubsidized below market rate (BMR, or naturally affordable) stock to raise rents. A better understanding of the tenants, ownership, and property characteristics of the BMR stock will help policymakers in the development tax systems that fit their policy objectives. My dissertation will examine two research questions that are important to scholarly and policy debates on rental housing affordability and property taxation and valuation. First I will examine the current drivers of sharp rent increases to assess the potential effects of land-value tax or property tax abatement programs on affordability and access goals. Second I will examine the tenant, property, and ownership characteristics of the BMR units to assess: (i) the extent to which the BMR stock provides LMI renters with quality housing in quality neighborhoods, (ii) the extent to which the BMR stock is under-built relative to zoning, and (iii) whether non-professional ownership is in fact the primary reason the units were BMR.

The BMR stock is under-studied in large part because of a dearth of data on rents and the difficulty of establishing that a unit is below-market. My dissertation will identify BMR units by observing rent increases (or rent spikes) that far exceed what can be explained by neighborhood changes and are not the result of property improvements. These rent spikes provide a strong indication that the unit had been rented at below market rates before the spike. My analysis will use 3 datasets that track rental units over time: (i) the American Housing Survey (AHS), (ii) the Bureau of Labor Statistics CPI Housing Survey, and (iii) listings data scraped from Craigslist by the Urban

Analytics Lab at UC Berkeley. The latter two datasets are under-used in housing studies but I have used both in my prior work. The use of multiple datasets allows for a larger sample size, triangulation of my results, and will shed light on the strengths and weaknesses of the datasets themselves, which is important given that the latter two datasets are rarely used despite the dearth of rental data generally. By gaining access to the restricted version of the AHS and CPI Survey I will be able to join these datasets to ownership data provided to UC Berkeley by Zillow and neighborhood-scale Census statistics. I will examine the entire US from 1995 to 2015, a period of multiple real estate cycles, and a period long enough for me to observe many instances of rent spikes I will first identify the drivers of sharp rent increases by creating a logit model. I will then analyze and describe the tenant, property, and ownership characteristics of the BMR stock before rent spikes.

EVOLUTION IN THE OWNERSHIP OF RENTAL PROPERTIES IN THE UNITED STATE

Abstract ID: 571

Group Submission: Privately-Owned Rental Housing in the US: Changes in Tenant & Owner Behavior

LEE, Hyojung [Harvard Joint Center for Housing Studies] hyojung_lee@harvard.edu, presenting author
SPADER, Jonathan [Harvard Joint Center for Housing Studies] jonathan_spader@harvard.edu, co-author
HERBERT, Christopher [Harvard Joint Center for Housing Studies] chris_herbert@harvard.edu, co-author

The financial crisis of 2007–2008 and subsequent recovery have reshaped the U.S. housing market, as homeownership has plummeted to its 50-year low, despite a recent uptick, and household growth has slowed down. Indeed, while there has been almost no growth in the number of owner-occupied households in the last decade, most of the household growth has been attributed to the rental market, especially single-family rental units. However, despite the growth of rental market, there has been a substantial upward shift in rents that is reducing supply of naturally occurring affordable units (JCHS, 2017). In addition, there has been a tremendous amount of activity in the sale of rental properties, in terms of the values and volumes of transactions. Given the defining issues of the current housing market, it would be quite natural to ask: What has happened in the rental housing market?

The recently released 2015 Rental Housing Finance Survey (RHFS), combined with the 2001 Residential Finance Survey and its 2012 wave, depicts the structural changes in the rental ownership in the United States, especially after the Great Recession (Lee, 2017). Among others, one of the most striking features is the rise in the share of rental properties that are owned by non-individual entities (e.g., property management companies, REITs). The trend could be not only found in single-family rental housing market, which has recently drawn the attention of media, but it applies to all sizes of properties. Given that one multi-unit property contains dozens of housing units, even slight changes in the ownership of those properties might have substantial effects on the whole rental housing market.

While informative, the RFS and RHFS do not provide more detailed information on the rental side of the market, geographically and temporally. Thus, in the collaboration with CoreLogic, a private company that provides property tax and transaction data, we will study the evolution in the ownership of rental properties. The CoreLogic's deed records cover almost all of the nation's transactions, and its property tax files provide terrific information on the housing units, including geographic identifiers that enable us to link neighborhood

characteristics. Using this data set, the paper (1) describes how ownership of rental properties has changed over time, (2) examines the determinants of rental ownership change, and (3) ultimately analyzes the effects on renters and local housing markets.

The shift in the rental ownership from mom-and-pop landlords to institutions might have substantial implications for both renters and broader housing market, as they have different motivation and thus respond differently to policy incentives (Mills, Molloy, and Zarutskie, 2017; Reina and Begley, 2014). In addition, Raymond and her colleagues (2016) present that large corporate landlords and investors were far more likely to file eviction notices than smaller landlords, suggesting the evolution in the rental ownership could result in potentially negative outcomes among the most vulnerable population. With detailed analysis based on the comprehensive data on the rental ownership, we discuss these issues in the paper.

HIGHER EDUCATION, HIGHER RENTS: COLLEGES, UNIVERSITIES, AND RENTAL HOUSING

Abstract ID: 572

Group Submission: Privately-Owned Rental Housing in the US: Changes in Tenant & Owner Behavior

MAWHORTER, Sarah [University of California, Berkeley] sarah.mawhorter@gmail.com, presenting author
EHLLENZ, Meagan [Arizona State University] Meagan.Ehlenz@asu.edu, co-author

Full-time undergraduate and graduate student enrollment rose 45% from 2000 to 2010 in the US, as Millennials attended college and graduate school at unprecedented rates, according to the National Center for Education Statistics. From the enrollment peak in 2010, full-time enrollment leveled off and declined 6% by 2015. Still, more students live in US cities than ever before; and educational attainment rates for young adults are substantially higher than previous generations. While some students live in dormitories provided by their university, many live in private (or university-private partnership) rental housing in adjacent neighborhoods.

In this research, we examine how increases in college and university enrollment, as well as growth in college-educated young adult populations, have affected demand for rental housing. Our analysis evaluates demand in both university and college adjacent neighborhoods and wider regions in the US from 2000 to 2015. We consider how these increases in rental housing demand, housing supply constraints, and other housing and labor market conditions have affected housing affordability for both young college graduates and those without college degrees.

To study changes in postsecondary enrollment in the context of neighborhood and regional housing market conditions, we link data on colleges and universities from the Integrated Postsecondary Educational Data System

(IPEDS) with Census and American Community Survey data for Combined Statistical Areas (CSAs) and census tracts interpolated to 2010 census tract boundaries. We supplement this data with detailed population and housing estimates from the US Census Bureau Population Estimates Program, as well as employment, wage, and establishment figures from the Bureau of Labor Statistics Quarterly Census of Employment and Wages.

We measure changes in enrollment and campus residency from 2000 to 2007 and 2007 to 2015 to estimate changes in student rental demand in the neighborhoods surrounding colleges and universities and aggregated CSAs. We analyze changes in rental demand, supply, and prices for different types of institutions located in urban, suburban, and rural contexts, as well as in economically successful and declining regions. We then turn our attention to housing affordability for young people aged 25-34, measuring housing outcomes for both college graduates and those without college degrees in regions with varying degrees of demand pressure and housing supply constraints.

We find that where the housing supply is constrained, even economically successful regions with high densities of educational institutions lost young college graduates relative to other regions. And, in those same high-cost, housing-constrained regions, young adults without college degrees faced the greatest housing affordability challenges. On the neighborhood level, we find sharp increases in young college graduates living in formerly low-rent neighborhoods.

This research lies at the nexus between higher education institutions and their impact on place. It expands upon research that asks how college-educated populations affect regional labor markets, adding a housing-focused dimension to economic talent attraction and retention questions (Andreason, 2015). The findings reveal the ways housing demand is shifting alongside significant growth in college-educated young adults; more broadly, the research assesses the impacts of universities and colleges beyond their campus walls and in their neighborhoods and regional housing markets. The discussion engages with contemporary planning challenges about housing demand and affordable housing supply, with an emphasis on the ways Millennials continue to shape their local and regional markets (Moos, 2015; Myers, 2016; Pfeiffer, Pearthree, and Ehlenz, 2018). This research also contributes to ongoing discussions in higher education circles, particularly around the impacts of university and college anchor institutions on neighborhoods (Ehlenz, 2017) and the trends for higher education institutions to pursue growth through development.

'THAT'S LIKE MY PENSION, THE PASSIVE INCOME:' WHAT DRIVES AMATEURS TO SPECULATE IN THE LOW-END RENTAL MARKET

Abstract ID: 573

Group Submission: Privately-Owned Rental Housing in the US: Changes in Tenant & Owner Behavior

The majority of rental properties in the U.S. today is owned by small- to medium-sized investors, many of whom enter the trade with little prior experience. While some are able to survive long enough to make a profit (Desmond 2016), small-scale urban landlords and property flippers operate with high levels of volatility (Brown 2004). Financial data on amateur real estate investment is limited, but the analyses that do exist suggest that the expected returns for this type of speculation are low and inadequate to compensate for its risks (Bayer et al. 2011, Depken II et al. 2009, Garboden and Newman 2012, Mallach 2006). Furthermore, because amateur real estate investments are highly leveraged and often individually guaranteed, the costs of failure extend well beyond the loss of invested capital, jeopardizing the investor's credit rating and personal assets as well.

This paper considers the economic, demographic and cultural factors that motivate these amateurs to purchase low-end real estate, despite consistent evidence of its high risks and relatively poor returns.

Methods: The paper draws on in-depth interviews with a stratified random sample of rental property owners in Baltimore, MD, Dallas, TX, and Cleveland, OH. Of the 127 interviews collected, 93 represent amateur investors for whom real estate investment represents a supplemental rather than primary income source. The interviews, which lasted between one and three hours, cover not only respondents' business strategies but their personal and professional histories as well. Data from these interviews is combined with participant observation of 22 real estate investment association meetings (REIAs),

Findings: Amateurs who decide to become investors often do so during periods when their professional identities are insecure or they perceive their retirement portfolios to be insufficient. Respondents manage the financial and emotional cost of failing to establish economic security through traditional means by adopting a new economic identity.

My respondents rationalize the risk of real estate investment by adopting a set of beliefs regarding the value of investment. Inductive analysis of transcripts and fieldnotes reveals three ideologies shared by the majority of amateur investors: 1) self-sufficiency, particularly self-employment, is a key aspect of personal well-being; 2) land and real estate is preferable to stocks, bonds, and other savings because the former are materially available and require no elite expertise; 3) in order to succeed, a person cannot hold back, he or she must be willing to take risks. Even when their investments prove more labor intensive and less profitable than they had hoped, amateur investors continue to utilize these ideologies to legitimate and motivate future investment behavior, even to their economic detriment.

The choice to embrace real estate investment, while certainly influenced by individual predispositions, is not entirely endogenous. I find that a host of profit seeking third-party actors including real estate gurus, paid mentors, and private lenders evangelize real estate investing. Investor seminars hosted by the REIAs, for example, serve a dual function of information transfer and collective public celebration of investment. This process serves the interests of third-party actors who manipulate investors' desire for a new economic identity to sell them additional training, recruit them for un- or low-paid labor, and lend them money at extremely high interest rates. This process pushes some investors into highly leveraged financial positions, increasing their economic insecurity, and, in some cases, moving them towards insolvency.

PRE-ORGANIZED SESSION SUMMARY

PARTICIPATION, GOVERNANCE, AND COMMUNITY DEVELOPMENT IN POST-DISASTER RECOVERY: LESSONS FROM PUERTO RICO, CHICAGO, NEW YORK, AND ABROAD

Summary ID: 39

Abstract ID: 646

Abstract ID: 647

Abstract ID: 649

Abstract ID: 1238

This panel will examine coordination mechanisms that emerge after disasters to address recovery concerns as well as the role of community organizations as they participate when disasters hit. Few studies exist on the role of coordination and networking in the short and long-term recovery after disasters and those that do, tend to focus on multi-sector coordination between public, private, and civil sector organizations. This panel will examine coordination between a specific set of actors (local community organizations, community development corporations, housing providers, builders, among others) in spaces that were directly affected by disasters as well as communities that received evacuees. We will present examples from Puerto Rico, the Puerto Rican diaspora in Chicago, New York and abroad.

Objectives:

- How socioeconomic and community development systems are affected by disasters?
- How planning, governance, decision-making, and community organization can create more resilient and adaptive systems to provide for shelter, food, and other basic community needs?
- The panel will bring key disciplinary areas of expertise, with the aim of formulating a community development and engagement framework for how to build resilient communities.

PUERTO RICANS AND HURRICANE MARIA: RECONSTRUCTING OWNERSHIP AFTER THE STORM

Abstract ID: 646

Group Submission: Participation, governance, and community development in post-disaster recovery: Lessons from Puerto Rico, Chicago, New York, and Abroad

GARCIA ZAMBRANA, Ivis [University of Utah] ivis.garcia@gmail.com, presenting author

Planning research has shown that renters, low-income individuals, those without housing insurance and people of color vulnerabilities multiply after a disaster strikes (Bates 2006). In Puerto Rico more than half of housing units are informal or illegally constructed (Viglucchi 2018). Given the situation, and that many have not obtained legal titles, this has made them ineligible for post-disaster housing aid, and they are cut off from programs that finance rebuilding or major repairs. About 60 percent of all applications received by FEMA have been ineligible for individual and household grants because of the lack of providing evidence of ownership. This research project is based on the stories of 10 individuals who could not provide a property deed or otherwise prove that they own their home. The author also conducted 5 interviews with government officials and non-profit organizations involved in advocating for these individuals at the Federal level. This is a participatory action research project, the author is part of a national working group on disaster housing recovery in Puerto Rico which led to many meetings on the topic and additional interviews with experts who have worked in New York, New Orleans, Houston and other disasters advocating for low-income individuals. These organizations were key in advocating that HUD shall consider evidence such as water, phone, utility, or other bills, and affidavits affirming such occupancy or tenancy. Preliminary findings show that most issues arise from: (1) cultural misunderstandings, (2), differences in legal interpretations, (3) frequent changes and errors and, (4) the scale of informal communities. This article provides recommendations how non-profit groups can participate in post-disaster recovery efforts as well how to advocate at the local and federal level for disaster victims effectively. In terms of theory, the following article seeks to understand cultural groups' diverse perspectives surrounding conceptions of ownership while simultaneously interrogating the means by which these groups contest, the impositions of dominant forms

of ownership (that is, deeds). Despite the claims of economists of the potentiality of homogenous development, it is of utmost importance that planners begin to come to terms with the empirical fact that communities' housing markets are built around historically contingent and path-dependent traditions and evolving cultures of their own (Hodgson and Knudsen 2013; Veblen 2009).

CHICAGO'S RESPONSE TO HURRICANE MARIA EVACUEES

Abstract ID: 647

Group Submission: Participation, governance, and community development in post-disaster recovery: Lessons from Puerto Rico, Chicago, New York, and Abroad

VANIK, Leonor [University of Illinois at Chicago] ivanik1@uic.edu, presenting author
BETANCUR, John [University of Illinois at Chicago] betancur@uic.edu, co-author

On September 20, 2017, Hurricane Maria made landfall as a Category 4 hurricane causing wide spread devastation throughout the island of Puerto Rico leaving behind over four million residents with limited infrastructure, electricity, potable water, and housing. The exodus of Puerto Ricans to the mainland United States, right after the Category 4 Hurricanes of Harvey and Irma has created a housing crisis for temporary shelter and housing in Texas and Florida. What makes this devastating is that these three hurricanes transpired within 30 days of each other. Where residents on the mainland could evacuate through car and plane, those on the island were castaways for weeks before accessing air and ship transport. Recovery efforts are difficult as Puerto Rico needs to adhere to strict cumbersome regulations for recovery and humanitarian access/efforts to the island.

Since 2005, Hurricane Katrina caused the academic world to produce materials on the built environment and infrastructure, and social equity discourse based on race, ethnicity and disability. The lessons learned from this literature seems to have been discounted after a decade without such harsh devastation and this literature has been discounted now with the emergence of new hurricanes it is important to revive this discourse. This paper is the launching ground for a larger research agenda on marginalized populations and the responses governmentality has to accessing Maslow's first and second tiers of hierarchy of needs. We use the mixed methods approach of grounded critical visualization concentrating on the life experiences of the Puerto Rican evacuees and stakeholders (specifically housing providers, government partners, and displaced residents) in the Chicagoland area. Through in-depth interviews, we broach the continuing struggle of providing and accessing affordable housing and access to governmental community amenities. This paper provides planning scholars and professional's: rich narratives of the struggles and resolve from stakeholders; of lessons learned from the evacuation process to finding housing; and, of integrating to interim daily life. We suggest a planning process for evacuation receivership at the local level in the hopes that the lessons learned will assist planning and housing officials at all levels of government and community development in preparing better policy responses to similar future crises.

PARTICIPATION WOES: PUBLIC PARTICIPATION IN POST-DISASTER RECOVERY PLANNING IN HAITI

Abstract ID: 649

Group Submission: Participation, governance, and community development in post-disaster recovery: Lessons from Puerto Rico, Chicago, New York, and Abroad

GANAPATI, Nazife [Florida International University] ganapat@fiu.edu, presenting author
MUKHERJI, Anuradha [East Carolina University] mukherjia@ecu.edu, co-author

How do communities affected by disasters decide whether or not to participate in post-disaster recovery planning processes? What are the factors that hinder or enable their participation? Despite a growing literature on planning for post-disaster recovery, our understanding of factors that can enable or create challenges for disaster survivors' participation remains limited. To fill this gap in the literature, we examine these factors in the context of post-earthquake Haiti. Our study is based on fieldwork conducted in three socio-economically diverse communities (Pétionville, Delmas and Canapé Vert) in Port au Prince in Haiti after the 2010 earthquake that claimed more than 220,000 lives. Our data collection methods include twelve focus groups (n= 63); in-depth interviews (n=54); two Town Hall Meetings; participatory site observation and review of secondary sources. Based on an NVivo analysis of our data, we argue that there were four main factors that hindered or enabled disaster survivors' participation in planning for post-disaster recovery: formal institutions (i.e., lack of rules and regulations that mandated public participation); organization-related factors (i.e., lack of emphasis on cultural competencies in international donor agencies); planner-related factors (i.e., lack of trust in the public); and disaster survivor related factors (e.g., faith and spirituality; and lack of trust in government and its representatives). Based on our findings, we provide policy recommendations on how planners and policy makers can better enable public participation in planning after disasters by introducing flexible, participatory institutions; nurturing cultural competencies; working to build trust and by collaborating with leaders of faith-based organizations.

HURRICANE SANDY'S LESSONS IN RESILIENCE

Abstract ID: 1238

Group Submission: Participation, governance, and community development in post-disaster recovery: Lessons from Puerto Rico, Chicago, New York, and Abroad

WHEELER, Jason [ASSIST Inc] info@assistutah.org, presenting author

In recent years, the relationship between the built and the natural environment has been dramatically affected by climate change, severe storm events, and rising sea levels. The extensive damage to low-lying waterfront zones caused by Superstorm Sandy in October 2012 reinforced the need for resilient infrastructure and redevelopment strategies for existing coastal communities throughout the greater New York area. The Rockaway Peninsula, a sandy stretch of land at the southeastern corner of the Borough of Queens, was particularly hard-hit by the effects of the storm. Costly damage to buildings, roads, and utility systems by the storm raises the controversial question of whether areas of particular geographic vulnerability should be rebuilt, maintained and defended, or simply abandoned. With these and other questions in mind, and given the scarcity of land and the significant need for housing and economic development in outlying areas of our nation's urban centers, the FAR ROC design competition "For a Resilient Rockaway" was organized to solicit creative ideas for resilient development strategies that can be implemented not only in New York City but also in vulnerable communities facing the severe effects of a changing climate all around the world. During the first of two phases, the competition garnered 117 innovative design proposals from firms and individuals in more than 20 countries around the world. Four of those teams proceeded to Phase II of the competition, which resulted not only in an expanded and rigorous exploration of resilience in architectural design but also in an engaged collaboration with the surrounding community. This paper discusses the premise behind the design competition and the role that architecture and planning can play in developing innovative processes and solutions that may be used to better serve and protect vulnerable communities everywhere. The paper further explores community-driven initiatives that followed in the wake of the storm and the design competition, including the creation of the pop-up "Sandy Design Help Desk," which traveled between hard-hit communities to provide direct technical assistance for homeowners and businesses seeking to rebuild following the storm.

FAR ROC was jointly sponsored by L+M Development Partners, The Bluestone Organization, Triangle Equities, the City of New York Department of Housing Preservation & Development, Enterprise Community Partners, and the Committee on the Environment of the New York Chapter of the American Institute of Architects (AIANY).

BEYOND THE SUCCESS STORY: PATTERNS IN CANADIAN RENTAL HOUSING POLICY

Abstract ID: 13

Individual Paper Submission

THOMAS, Ren [Dalhousie University] ren.thomas@dal.ca, presenting author

Rental housing has emerged as a critical housing and tenure type in the housing continuum, which represents increasing levels of affordability and independence from emergency shelters to market ownership. Despite the fact that an increasing percentage of households cannot afford market ownership, very few new developments create rental housing; most Canadian rental stock is over 40 years old. This study aims to synthesize knowledge

from case study cities on barriers and solutions to rental housing protection and development through systematic case comparison, a method that offers significant opportunities in knowledge development and analytic generalization.

Many studies documenting barriers to implementation focus on a single city (e.g. Mendez 2016). This study aims to determine how cities have or have not overcome barriers to developing and protecting rental housing in case study cities across Canada, and to develop more generalizable findings than would be possible with a single case study (Thomas and Bertolini 2014). The findings can then be used to facilitate policy learning among local stakeholders in rental housing development (e.g. Grin 2010, Thomas and Bertolini 2015). With the roll-out of the new National Housing Strategy beginning in 2018, municipalities may be able to implement more rental housing. It is an ideal time to learn from other cities to affect broader implementation of programs and policies that are already achieving results (e.g. increase in the number of rental units, preservation of existing units targeted to low-income renters, rental renovation programs enabling seniors to age in place, governance structures that facilitate land development for affordable rental housing).

Fifteen mid-sized and large Canadian cities were chosen to represent a range of success, or even failure, in implementing and preserving rental housing. The study approach includes the development of case studies through review of municipal and regional policies/housing strategies and a survey of planners, policy makers and housing authority staff in each city (Part 1). Once the case studies are completed, a meta-analysis of the cases will determine cross-case patterns (Miles and Huberman 1994) and a policy learning exercise will be used to determine whether ideas common to other cities can be integrated into local policy development (Part 2). This paper will concentrate on the findings from Part 1, the policy review and survey, which are now complete.

LAND, URBAN FORM, AND POLITICS: A STUDY OF DUBAI'S HOUSING LANDSCAPE AND RENTAL AFFORDABILITY

Abstract ID: 25

Individual Paper Submission

KHANAL, Asim [Masdar Institute] khanal.asim73@gmail.com, presenting author
ALAWADI, Khaled [Masdar Institute] khaled.alawadi@gmail.com, primary author
ALMULLA, Ahmed [Masdar Institute] , co-author

A major indicator of urban livability and equity worldwide is the availability of sufficient, diverse, attractive, and affordable housing stock for a wide range of income classes (Tighe, 2010). Affordability is central to sustainable development as it relates to housing provision (Aribigbola, 2011). Implementing affordable housing policy presents several challenges. High land costs, inflexible zoning codes, market control, and lack of sufficient financing all limit the realization of low-income housing projects (Cowan 2006; Goetz 1993). Aggravating these structural forces are individual preferences for homogeneous neighborhoods and reluctance on the part of

proprietors to take personal risks to realize racial and economic integration (Tighe, 2010; Alawadi and Benkraouda, 2017).

This study aims to expand the discussion on affordable housing literature with a particular focus on the major drivers of affordability issues. Dubai, a rapidly developed city, appears as a unique case where its land use system aggravate affordability figures. There is a general perception that Dubai is built for the well-off. The construction of mega developments feeds a longstanding narrative that Dubai is solely a luxurious place. This study assesses this portrayal of Dubai and explores Dubai's residential landscape in terms of morphology and affordability. Dubai has received more recognition than any other city in the Gulf region for creating its own form and flavor of urbanism (Alawadi, 2016).

The majority of work written about Dubai in the urban planning literature portrays either the city's history, its rapid pace of development, or its informal urbanism. This study is designed to provide precise and detailed knowledge about existing housing patterns and rental figures in Dubai. Mapping urban form was used to understand and analyze rental affordability figures. The research provides a snapshot of the most prevalent formal attributes that shaped Dubai's housing landscape in the course of the city's urbanization process, accompanied by a rental affordability analysis for every identified housing landscape. In particular, we ask: What are the different housing patterns prevailing in Dubai's built landscape? What are the major driving factors that influenced Dubai's housing transformation? How affordable is Dubai to its residents? Does Dubai's built landscape accommodate a large spectrum of income classes?

The study utilizes the study of Dubai's urban morphology and evolution to assess and understand affordability issues. Analysis of literature and geospatial mapping reveals nine distinct residential patterns in Dubai. The identified patterns are presented under six thematic periods stretching from 1900 to 2016 to highlight the contributing forces that shaped Dubai's housing landscape. Results expand the boundaries of affordable housing issues into concerns including land use control and its impact on housing forms. Findings reveal that Dubai's land use policy creates spatial and housing affordability challenges. The state housing policy of providing large plots and exclusive suburbs for natives and the government's partnership with the private sector to brand Dubai through projects for the well-off have created a formidable housing challenge for the middle class. One major challenge is the lack of sufficient affordable housing units for the middle-class population; rental figures for this group are at crisis point. Only 23% of total housing units, which corresponds to a mere 7% of the total housing floor area in Dubai, are affordable for this group. To eradicate these ills of housing affordability, the planning profession in Dubai must derive practices from a number of internationally recognized planning and rental control policies.

HOUSING RESILIENCE TO THE GREAT RECESSION: A GEOGRAPHICALLY WEIGHTED REGRESSION APPROACH TO INVESTIGATING THE SPATIALLY-VARIED BUILT-ENVIRONMENT EFFECTS ON HOUSING PRICE

Abstract ID: 38

Individual Paper Submission

CHEN, Na [University of Cincinnati] chenna997@hotmail.com, presenting author

Many cities have experienced housing downturn, an average drop of 30% in housing prices, since the financial crisis occurred in 2008 (NaKajiMa, 2013). Since then, there have been studies that focused on the effects of urban form on housing res For instance, Dong (2015) found that the effects of new urbanist's features were overall moderate in the case study of Portland, Oregon. A drawback of these studies is the neglect of the local effects of built-environment features on housing resilience. A built-environment feature might have positive effect on housing prices at some locations while having neutral or negative effect at some others. These positive and negative effects might cancel out and therefore are not captured in a general regression model. Another concern is whether these effects would be statistically significant everywhere over the region. Furthermore, the spatial pattern of local built-environment effects estimated in the period of recession might be different from that in the period of recovery. These all echo to the need of a spatial housing price evaluation model to better understand how resilient each of the built environment features performs locally in both the periods of recession and recovery.

Hedonic pricing modeling has been widely used to account for the effects of various housing components on housing price, including internal configuration, location effects, neighborhood quality, and environmental amenities (Freeman Iii, 1979; Xiao, 2017). From the perspective of planning, this method could be extended to examine which built-environment feature is more resilient to the impact of recession by looking at their marginal effects on both housing price decline and recovery. In addition, spatial autocorrelation is one of the major criticisms of using a hedonic model. For instance, houses in the same neighborhood are likely to have similar internal attributes, neighborhood quality, and environmental features. The ignorance of spatial autocorrelation might result in biased or inefficient estimated results. A geographically weighted regression (GWR) model is selected to examine the local built-environment effects on housing price decline and recovery during and after the recession, because GWR models allow for the estimated relationships in a regression model to vary in a geographical space.

In this study, the housing price decline and recovery will be computed and then mapped using ArcGIS. A GIS analysis will follow to overlap the mapping results with the map of community opportunity index (COI) This index, developed by Wang and Chen (2017), was computed by a set of socioeconomic characteristics, showing the distribution of community opportunities and vulnerabilities in Columbus, Ohio. The purpose of the COI is to support the argument that where individuals live could affect their socioeconomic outcome. The overlapping results will visually reveal who are the winners and losers during and after the recession. Next, a GWR model will be estimated to capture the spatially regression framework by allowing local parameters to be estimated.

The mapping results will show whether the recession would impact socially-disadvantage neighborhoods more than the others, and whether the housing price in these neighborhoods would take a slower step to recover from the recession. Additionally, the GWR results will reveal (1) the marginal effect of each built-environment feature on housing resilience, and (2) the spatial variations of these effects over the region. The results of marginal effects and spatially-varied effects can be used to help locally allocate land uses and public infrastructure and facilities toward a housing-resilient city and a fair community opportunity framework.

WHAT MAKES RESIDENTS SATISFIED WITH THEIR NEIGHBORHOODS? AN IMPACT ASYMMETRY ANALYSIS USING THE MACHINE LEARNING TECHNIQUE

Abstract ID: 41
Individual Paper Submission

WU, Xinyi [University of Minnesota] wuxx1088@umn.edu, presenting author
CAO, Xinyu [University of Minnesota] cao@umn.edu, co-author

Neighborhood satisfaction has been widely studied as an important domain of life satisfaction. Research shows that neighborhood satisfaction has positive correlations with well-being and mental health. It also has significant impacts on residential mobility, which affects the stability of communities. Examining the determinants of neighborhood satisfaction can provide implications for neighborhood improvements for both planning researchers and practitioners, thus making it an important topic to study. Using the data collected in Minneapolis, Minnesota, this study explores how neighborhood characteristics affect neighborhood satisfaction. Compare with the state of the art, this study resolves several limitations of the traditional regression by applying a machine-learning technique. It also employs the impact asymmetry analysis (IAA), which has rarely been used in planning, to provide a more in-depth understanding of the subject matter and to provide better-reasoned implications.

The impact asymmetry analysis (IAA) is a methodology used in the field of management and marketing to improve service qualities. IAA categorizes service attributes into five factors based on their impact on the overall satisfaction. Among these five types, dissatisfiers cause dissatisfaction when performing poorly, but do not lead to satisfaction when performing well. Frustrators are the extreme cases of dissatisfiers. On the contrary, satisfiers lead to satisfaction when performing well, but do not cause dissatisfaction when performing poorly. Delighters are the extreme cases of satisfiers. Finally, hybrids are the attributes than can cause both satisfaction and dissatisfaction.

Using the gradient boosting algorithm, we calculate the relative influences of 31 variables on neighborhood satisfaction. Then, we apply the IAA and classify these variables into the five factors based on their abilities to generate dissatisfaction/satisfaction. In Table 1, we summarize the factor classifications of the variables with a relative influence higher than 1%, as well as the average performance of each variable.

The four variables that have the largest relative influence are the looks/design of the neighborhood, safety from crime, cleanliness, and noise of the neighborhood. Among them, the look/design is a satisfier that can increase the satisfaction when performing well but does not decrease the satisfaction when performing poorly. The safety from crime, cleanliness, and noise of the neighborhood are all hybrids, suggesting they can increase and decrease satisfaction, depending on their performances.

Table 1 The factor classification and average performances of relatively important variables

Classifications	Service attributes	Average performance	Relative influence (%)
Delighter	Bike trail/paths in your neighborhood	3.677	2.167
Satisfiers	The looks or design of the neighborhood	3.950	16.100
	Air quality in neighborhood	3.841	3.355
	Street cleaning in your neighborhood	3.790	2.447
	Safety from traffic in your neighborhood	3.460	1.574
	Neighborhood greenery	4.167	1.298
Hybrid	Safety from crime in your neighborhood	3.460	9.064
	Neighborhood cleanliness	3.628	8.918

	Noise in the neighborhood	3.418	8.321
Frustrator	Access to quality schools and other education facilities	3.900	5.781

THERE GOES OUR FAMILY FRIENDLY NEIGHBORHOOD: RESIDENTS' PERCEPTIONS OF INSTITUTIONALLY DRIVEN INNER-CITY REVITALIZATION IN BUFFALO, NY.

Abstract ID: 52

Individual Paper Submission

SILVERMAN, Robert [University at Buffalo] rms35@buffalo.edu, presenting author
TAYLOR, JR., Henry [University at Buffalo] htaylor@buffalo.edu, co-author
YIN, Li [University at Buffalo] liyin@buffalo.edu, co-author
MILLER, Camden [University at Buffalo] camdenmi@buffalo.edu, co-author
BUGGS, Pascal [University at Buffalo] oascalbu@buffalo.edu, co-author

Central Theme. This paper examines residents' perceptions of urban revitalization. It focuses on neighborhoods undergoing revitalization in a legacy city, Buffalo, NY. The revitalization process in legacy cities follows an eds and meds strategy, since it is heavily influenced by institutional actors from government and the education and medical sectors (Mallach & Brachman, 2013; Adams, 2014). Although the eds and meds strategy is cited as a core component of urban revitalization, scholars have argued that it can spur gentrification, displacement, and disrupt the fabric of neighborhood life (Silverman et. al., 2014). This paper argues that the revitalization driven by the eds and meds strategy heightens resident concerns about changes in the structure and function of neighborhoods. In particular, this form of revitalization, which focuses on mixed-use development and attracting new residents who are students and members of the creative class, transforms core city neighborhoods from affordable, working class residential spaces to places that accommodate the needs of more transient constituencies. In part, this shift reflects the replacement of neighborhood control mechanisms based on primordial ties with transactional relationships (Suttles, 1968). It also is reflective of the greater emphasis that the eds and meds strategy places on exchange versus use values (Logan and Molotch, 2007).

Methodology. This paper draws from data collected in Buffalo, NY for a larger research project called Turning the Corner which was sponsored by the Urban Institute. The focus of that project was to identify planning strategies to address negative externalities caused by neighborhood change and heightened risks of displacement due to revitalization. Data were collected through a series of focus groups with residents and stakeholders in working class, minority neighborhoods which were identified as being in the early stages of revitalization. A total of nine focus groups were held across three neighborhoods experiencing encroachment due to institutional investments from the eds and meds sector and real estate speculation. The focus groups were held during the fall of 2017. The data were coded and analyzed using ATLAS.ti software by multiple investigators from the research

team who adopted an analytic framework guided by standpoint theory, which focuses on amplifying the voices of groups traditionally disenfranchised from the planning and policy processes.

Findings. Three themes emerged from the analysis. First, residents perceived urban revitalization to have a destabilizing effect on residential spaces. Change brought about by revitalization was perceived to reduce residents' quality of life and their access to amenities that primarily benefited working class households. Second, the influx of newcomers with more transient residential patterns and the greater emphasis on mixed-use development was perceived to threaten long-term residents' control of neighborhood spaces. Residents expressed concerns about increased unpredictability in their surroundings and social interactions as a result of revitalization. Third, residents perceived revitalization driven by eds and meds strategies as detrimental to family friendliness at both the neighborhood and city levels. This was due to the transformation of neighborhood services, housing, and retail spaces with a focus on accommodating the needs of growing student and professional populations.

Relevance to Planning. This paper provides planners with residents' perceptions of a popular approach to inner-city revitalization, the eds and meds strategy. Insights from the analysis are used to identify planning tools that can be applied to future revitalization aimed at protecting minority, working-class neighborhoods when institutionally driven revitalization occurs. This is particularly important when the interests of minority, working class residents are perceived to come into conflict with those of newcomers and mixed-use development strategies. The paper also identifies a key concern for the long-term sustainability of revitalized areas, the production of neighborhood spaces that are family friendly.

INVESTIGATING SERIOUSLY DELINQUENT MORTGAGES IN HISPANIC/LATINO NEIGHBORHOODS IN METROPOLITAN STATISTICAL AREAS IN THE UNITED STATES

Abstract ID: 62

Individual Paper Submission

ANACKER, Katrin [George Mason University] kanacker@gmu.edu, presenting author

While some scholars have discussed the different housing outcomes among Hispanic/Latino subgroups, not much is known about rates of seriously delinquent mortgages among neighborhoods in which different Hispanic/Latino subgroups reside (Rugh and Hall, 2016). I utilized data from the 2010 Neighborhood Stabilization Program (NSP) 3 and the 2005/2009 American Community Survey (ACS) for all MSAs in order to answer two research questions. First, what determinants influence the rate of seriously delinquent mortgages among Census tracts in which different Hispanic/Latino subgroups reside? Second, what determinants influence the rate of seriously delinquent mortgages in Census tracts? I ran descriptive statistics and a Weighted Least Squares (WLS) regression.

My dependent variable was the rate of seriously delinquent mortgages (i.e., delinquent or in foreclosure for 90 or more days in June 2010) at the Census tract level. The independent variables were Census tract demographic characteristics, Census tract socioeconomic characteristics, and Census tract housing characteristics. The U.S.

Bureau of the Census differentiates among the following Hispanic/Latino subgroups: Mexican, Puerto Rican, Cuban, Dominican; Central American (i.e., Costa Rican, Guatemalan, Honduran, Nicaraguan, Panamanian, Salvadoran, and Other Central American); and South American (Argentinean, Bolivian, Chilean, Colombian, Ecuadorian, Paraguayan, Peruvian, Uruguayan, Venezuelan, and Other South American).

Results shows that there are large differences in the rate of seriously delinquent mortgages at the Census tract level among the different Hispanic/Latino subgroups for select thresholds (10, 20, and 30 percent). For example, Census tracts with Nicaraguan households have the highest rate of seriously delinquent mortgages (19.36 percent at the 10 percent threshold), followed by Census tracts with Cuban households (18.83 percent), Census tracts with Uruguayan households (16.23 percent), and Census tracts with Guatemalan households (13.92 percent). Interestingly, Census tracts with Paraguayan households have the lowest rate of seriously delinquent mortgages (3.84 percent), followed by Census tracts with Chilean households (5.58 percent), Census tracts with Bolivian households (7.79 percent), and Census tracts with Panamanian households (8.93 percent).

The regression model explains 41.12 percent of the total variation in the rates of seriously delinquent mortgages for all analyzed Census tracts. Twenty-three out of 28 independent variables were significant at the 5 percent level. Almost all signs are consistent with the literature and expectations. In terms of economic factors, Nicaraguans, Uruguayans, and Guatemalans may have few financial resources due to past political unrest that may have affected their incomes and wealth, including savings for downpayments. Many may have few financial resources due to relatively high remittances, as in the case of Nicaragua and Guatemala. Although Cubans enjoy immigration protections, are disproportionately middle class, and have a relatively high homeownership rate, many Cubans are self-employed and thus may have experienced difficult times during and after the Great Recession.

In terms of social factors, most Latin and South American nations, with the exception of Cuba, have had a relatively short immigration history to the U.S. and have thus benefitted from the Immigration and Nationality Act of 1965. Some subgroups may live in ethnoburbs along with ethnic brokers and lenders as well as mutual aid benefit societies, which may help in becoming a homeowner, although homeownership may result in foreclosure.

These quantitative findings are consistent with qualitative findings by Pfeiffer et al. (2014 and Reid 2016). Potential strategies to address these issues could be linguistically and culturally competent homeowner education, counseling, and lending, along with legislation to protect homebuyers, regardless of race, ethnicity, nativity, or class. Future approaches could also utilize focus groups and in-depth interviews to unpack the relationship between foreclosure and cultural factors in a comprehensive fashion.

HOMEOWNERSHIP AFTER THE GREAT RECESSION: DO PLACE-BASED CHARACTERISTICS EXPLAIN LONGER RENT SPELLS AMONG "OWNER-READY" FAMILIES?

Abstract ID: 66

Individual Paper Submission

GHORBANIZIGSARI, Pooya [The New School] ghorp982@newschool.edu, presenting author

Homeownership rates across the U.S. have declined from a peak of over 69 percent in 2006 to 62 percent in 2016. This historic decline was concurrent with the mortgage market breakdown and the Great Recession. Most studies show that massive waves of foreclosure, together with tighter lending regulations after the recession, are the two main factors that explain higher rates of exit from homeownership, and lower rates of entry to it. Curiously, however, homeownership rates also declined among middle- to higher-income families with fewer financial barriers. In this paper I focus on this group, i.e. renters with sufficient financial resources to afford a standard mortgage in their area of residence. I call these renters “owner-ready,” and ask why they do not become homeowners, after the recession, at the same rates as they did before.

Specifically, I focus on the role of place in homeownership decisions after the recession, and pose three questions about place-based factors that could affect time-to-ownership among “owner-ready” families. First, I test the role of access to employment opportunities and job markets in homeownership decisions, which concerns how time-to-ownership for financially-stable families could vary by the density and types of available jobs. Second, I examine whether living in areas with more favorable characteristics could lead to longer waiting periods among higher-income higher-skill renters. These areas might have higher homeownership costs and provide a more limited set of affordable options. Third, I ask if exposure to foreclosures discourages families from investing in homeownership. Renters always take into account the trade-offs between homeownership and all the above place-based qualities when considering homeownership, but I specifically take interest in how those trade-offs may have changed after the Great Recession.

The study sample is a longitudinal subset of the Panel Study of Income Dynamics (PSID) family data between 1999 and 2013, which only includes renters that can secure a mortgage each year. I employ logistic regression and survival models to estimate the likelihood of, and time to, homeownership as affected by place-based characteristics. I document that the typical “owner-ready” renter takes about 2 years longer after the recession to become homeowner, compared to before. Areas with higher density of high-salary jobs, better access to public transportation, larger supply of rental units, and lower crime rates are correlated with longer rent periods after the recession, ranging between 7 and 11 months depending on the model specified. While foreclosure is a significant determinant of time-to-ownership, I do not find the post-recession effect to have significantly changed compared to the pre-recession period. Overall, I find that time-to-ownership became longer among “owner-ready” renters after the recession, manifested especially in areas with more favorable place-based characteristics.

These findings contribute to the scholarship on the trade-offs between choice of tenure and qualities of place. Studying affluent renters is important because their resources can affect—primarily via tenure and locational choices—other income groups’ access to affordable housing. Changes in their homeownership decisions could also exacerbate spatial disparities in access to housing, jobs, and services. I recommend for housing policy to take measures to strengthen rental markets in areas that are attractive to “owner-ready” renters, in order to mitigate excessive rent burdens for lower-income renters in those areas. These measures include bolstering the supply of affordable rental units through providing incentives for new construction, diversifying homeownership assistance options for lower income renters, and expanding on housing choice voucher programs. Pursuing a more diverse array of land ownership options, e.g. land banking or collective ownership, could help decommodify land, reduce rent costs, and alleviate spatial disparities within and among urban neighborhoods.

UNDERSTANDING WHY BABY BOOMERS LEAVE HOMEOWNERSHIP: LESSONS FROM THE 2007-2009 GREAT RECESSION

Abstract ID: 99

Individual Paper Submission

KIM, Jinyhup [University of Maryland] jinyhup.kim@gmail.com, presenting author

With the aging of the baby boomer generation and increased longevity, America's older population (age 50 and over) is projected to equal 132 million in 2030. Under this demographic upheaval, old households will continue to serve as the most influential key factor on the near future's housing market.

This study relies on the data from the 1968 – 2015 Panel Study of Income Dynamics (PSID). In using Cox Proportional models to track the elderly's transition from homeownership, this study conducts survival analysis, which investigates the time it takes for the transition from homeownership to occur. Particularly, this study examines how the U.S. recession of 2007 – 2009 has an effect on the elderly's tenure decisions, using mortgage distress and foreclosing information released by the PSID 2009 data. This study mainly examines the reasons why the elderly make the transition from homeownership to rental status or downsize to smaller owned homes. The findings suggest that age itself is not associated with the elderly's tenure decision. Instead, life cycle factors such as marital status, disability, retirement, income, and wealth, which are time-varying variables, encourage old households to become renters or to downsize to smaller homes. However, when mortgage distress and foreclosing variables are included, the results are quite different. Above all, the loan to value ratio serves as a significant role in liquidating their housing wealth. Households who reconstructed or refinanced their original mortgage consistently decrease the likelihood of making the transition. But against expectations, households who have had difficulties recently making mortgage payment never tend to be renters or downsize their homes.

This study provides insight into understanding old households' housing tenure decisions that lead to becoming renters or downsize to smaller owned homes. As the baby boomers start to retire, the evidence for old households is growing in importance. If a large enough number of baby boomers, by making this decision, return to urban cores from suburbs, it could have important implications for densities in cities.

SHAPING THE PLACE OF SUBURBAN POVERTY: A POLITICAL ECONOMY PERSPECTIVE ON THE SUBURBANIZATION OF POVERTY

Abstract ID: 106

Individual Paper Submission

FOOTE, Nathan [Rutgers, The State University of New Jersey] nathan.foote@rutgers.edu, presenting author

Suburbanization of poverty is a popular framework for examining the changing location of poverty in the United States (Cooke and Denton, 2015). Yet, despite evidence for the differentiation of suburban places beyond a simple inner/outer ring binary (Hanlon, 2009), previous research on the suburbanization of poverty largely has not examined how these finer variations may influence the process. While recent research has begun to examine the trend with more nuanced approaches to suburban differences (Cooke and Denton, 2015; Lee, 2011), these approaches tend to obscure the social basis of place differentiation. A perspective from political economy is

useful in foregrounding this social basis, allowing planners and scholars to examine the process for potential inequalities in the placing of suburban poverty.

The political economy framework suggests that places are shaped, in part, by the actions of residents seeking to enhance the use values of the areas in which they live. Privileged residents have a greater ability to do so because of their access to social, political, and economic resources. This generates places that are more privileged than others, creating a system of place stratification which reinforces (and is then further reproduced by) social status stratification (Logan and Molotch, 1987). The recent literature on neighborhood typologies and trajectories (Wei and Knox, 2014) suggests the possibility of identifying a stratified neighborhood hierarchy that may be useful in examining various trends in the metropolitan areas of the United States through the lens of political economy. This includes the suburbanization of poverty.

Using this political economy neighborhood stratification framework, the following research questions are addressed in this study. First, what suburban neighborhood types existed in large population metropolitan statistical areas of the United States in 1990? Second, what are the poverty rate changes between 1990 and 2010 for each of the identified suburban neighborhood types? Finally, what are the determinants of the poverty rate changes in each of the neighborhood types?

It is hypothesized that there is a hierarchy of suburban neighborhoods and that the poverty rate change is different between the types of neighborhoods in the hierarchy, with the more privileged types experiencing less poverty increase than less privileged types. Furthermore, it is hypothesized that there are differences in the determinants of poverty rate changes in each of the neighborhood types of the hierarchy.

A multivariate clustering technique is used to identify types of neighborhoods (operationalized as census tracts) in 1990 in the 55 most populous metropolitan statistical areas in the United States. Data is drawn from the Neighborhood Change Database, which normalizes 1990 Census data to 2010 census tract boundaries. Analysis of variance (ANOVA) and t-tests are conducted on individual level poverty rate changes between 1990 and 2010 to determine significant differences in these changes, and linear regressions are used to analyze determinants of poverty rate changes.

Six suburban neighborhood types are identified in 1990 and arranged in a socioeconomic hierarchy: Elite, Newer, New Start, Stable, Mixed, and Minority. Each have significantly different mean poverty levels in both 1990 and 2010, and all six have significantly higher mean poverty rates in 2010 than in 1990, but with significant differences between the types. Preliminary regression results indicate that the determinants of these changes largely fall in line with previous research, with socioeconomic change variables and regional location being especially important. From a scholarly perspective, these results indicate the importance of understanding the politics of producing suburban place in the shifting locations of poverty. From a planning and policy perspective, the results suggest the need for place-based and democratic community interventions that benefit less privileged residents.

GATEWAY METROPOLITANS, ETHNIC NEIGHBORHOODS: IMPACTS OF MULTI-SCALE RACIAL CONCENTRATION ON NEIGHBORHOOD FORECLOSURE RISK

Abstract ID: 107

Individual Paper Submission

LEE, Aujean [University of California, Los Angeles] aujean@ucla.edu, presenting author
GREENLEE, Andrew [University of Illinois at Urbana-Champaign] , co-author

Since the 1965 Hart-Cellar Immigration Act passed, the U.S. has experienced significant demographic changes. Immigrants who arrived after 1965 settled in established gateway cities, such as New York, Los Angeles, Chicago, and Boston, increasing Latino and Asian populations. With economic expansion and refugee resettlement programs, new immigrant gateways emerged after the 1990s in new cities and regions, such as the Midwest and South (Singer, 2008).

America's shifting immigrant population impacts local and regional residential segregation and housing markets. Immigrant gateways may reinforce segregation because of established ethnic enclaves; newer immigrant gateways would provide opportunities for immigrants to live in integrated neighborhoods. However, there is mixed evidence on residential segregation in new immigrant gateways. For example, Park and Iceland (2011) found that immigrants have lower levels of segregation in newer gateways than established gateways. In contrast, Hall (2013) identified that immigrants in new destinations were more segregated, after controlling for immigrant group and metropolitan characteristics. The mixed findings demonstrate that settlement patterns vary depending on the geographic scale and regional effects.

Residential segregation also relates to the local housing market for several reasons. Immigrants have lower homeownership rates than native-born residents in newer gateways, a gap which last 15 to 20 years (Painter & Yu, 2008). Recent evidence also showed that minority and immigrant neighborhoods were targeted by subprime lenders (Mayer & Pence, 2008). With the foreclosure crisis, these neighborhoods also had higher rates of foreclosure, which affect neighborhood stability and local government revenue. After the Recession, neighborhoods with large proportions of immigrants also have recovered at slower rates in home values after the foreclosure crisis compared to predominantly white neighborhoods.

Thus, immigrant concentration may affect neighborhood stability. Yet, it is unclear if immigrant neighborhoods have differing impacts on foreclosure risk based on the metropolitan and neighborhood-level characteristics. Housing markets also have their own local and regional scale effects, where neighborhoods within a region have more volatile prices than others. This study fills the gap in literature on understanding how differing immigration patterns affect neighborhood homeownership risks, after controlling for neighborhood and metropolitan characteristics.

This article uses multivariate regression analyses of tracts in the largest 37 metropolitan areas with varying immigration histories using data from the U.S. Census Bureau and U.S. Department of Housing and Urban Development (HUD) Neighborhood Stabilization Program (NSP) data. While these metropolitan regions were immigrant gateways at some point, we test the relationship between newer gateways and neighborhood foreclosure risk. We also use a typology of neighborhood-level segregation based on racial composition, class, and nativity to see if neighborhood composition affects the relationship between metropolitan regions and risk. Finally, we add in individual metropolitan housing markets to test additional regional effects on foreclosure risk scores. Our study also demonstrates the importance of understanding the reasons for racial segregation, with differing impacts on housing outcomes.

The findings illuminate multiple factors that help to explain the persistence of segregation patterns and the implications for neighborhood stability. The study also demonstrates the importance of disentangling class and racial segregation in neighborhood choice. By using a more comprehensive analysis of the intersections between race and class, planners can work to develop cities that are inclusive, support neighborhood stability, and access to socioeconomic resources.

PRESERVING DECENT AFFORDABLE HOUSING IN DETROIT: LOW-INCOME HOUSING TAX CREDIT PROJECTS AT YEAR 15

Abstract ID: 121

Individual Paper Submission

DENG, Lan [University of Michigan] landeng@umich.edu, presenting author
 DEWAR, Margaret [University of Michigan] medewar@umich.edu, primary author
 BLOEM, Melissa [University of Michigan] mlubbers@umich.edu, co-author

This study examines the efforts to preserve decent affordable housing developed under the Low-Income Housing Tax Credit (LIHTC) program in Detroit that are facing the expiration of their 15-year affordability compliance requirement. The LIHTC program is the largest federal affordable housing production program (Schwartz, 2015). In Detroit the program has funded 298 projects with about 13,000 low-income units since its beginning in 1986. When projects reach 15 years of operation, the tax-credit investors sell or transfer their ownership, usually to another partner in the project. From 2016 to 2022, 104 LIHTC projects, 7,700 low-income units (about half of the city's total LIHTC housing stock), have reached or will reach year 15.

Research has not addressed what happens to LIHTC projects facing year 15 in very weak housing markets. The national characterization of outcomes such as studies conducted by Schwartz and Meléndez (2008) and Khadduri et al. (2012) do not describe Detroit's because of the deterioration of Detroit's housing market. In addition, most existing research uses data on projects that reached year 15 before the recession and relied on interviews and surveys of those involved in LIHTC development. Prior research has lacked project-level data needed to identify challenges and find solutions.

For the past two years, we have been working with city leaders and LIHTC industry stakeholders including nonprofit developers and syndicators in Detroit to examine the year-15 challenges for LIHTC projects in Detroit. First, we have been studying the outcomes of earlier LIHTC projects that have passed year 15 to learn whether they remain as decent affordable housing. Second, we have collected financial audit reports for as many projects as we could that are reaching year 15 from 2016 to 2022 to help us understand how severe the financial challenge is. Third, we have been interviewing our partners to learn about what happened to their projects and what they have done in dealing with this issue. Fourth, we have also studied how other cities with similar housing markets are addressing the year-15 issue for their LIHTC projects.

As a result of our financial analysis, we found that a substantial share of LIHTC projects in Detroit are in a weak financial position; net operating income may not cover hard debt or may not be sufficient to allow borrowing for physical improvements. Those projects need to restructure their financing so that they could stay viable. If debt is not renegotiated, some of them might be facing foreclosure. As LIHTC projects approach year 15, their ownership structure also needs to be restructured. Previous studies have shown that preserving LIHTC housing in the long term will depend on mission-focused nonprofit organizations who can step into ownership (Schwartz and Meléndez 2008; Khadduri et al. 2012). However, many nonprofit general partners in Detroit lost so much capacity

during the recession that they are not able to take on full ownership or do not want to do so. Our study examines these challenges at the individual project level. With information gathered from our community partners and lessons learned from the study of practices in other weak-market cities, we also provide suggestions on what be done to address those challenges in Detroit.

UNDERSTANDING LARGE HOUSING ESTATES IN EUROPE: AN INQUIRY ABOUT POVERTY, SEGREGATION, AND POLICY CHALLENGES

Abstract ID: 176

Individual Paper Submission

HESS, Daniel [University at Buffalo, The State University of New York] dbhess@buffalo.edu, presenting author

Large housing estates built between the 1950 and 1980 in European cities were once envisioned as social Utopias that would solve many urban problems at times of rapid industrialization and urbanization. These estates were carefully planned with the aim to provide middle class families with high quality living environments in a cost-efficient manner. But despite good intentions by the planners, many of these large housing estates are now often seen as problem areas, which are undesirable to live in. As a result, housing estates are now often populated by households with few options on the urban housing market. Despite more than a decade of investments in large housing estates in cities across Europe, problems in many of those estates have deepened. This article investigates the role that large housing estates play in the reproduction of inequalities, poverty, and segregation in European cities today. The article is based on several in-depth analyses and case studies of housing estates in 14 European cities—Athens, Berlin, Birmingham, Brussels, Budapest, Bucharest, Helsinki, Madrid, Milan, Paris, Moscow, Prague, Stockholm and Tallinn. The main contribution is delivered in the form of nine takeaway lessons on the origins, trajectories of change and the future prospects of large housing estates in Europe.

VISIONS OF A SOCIAL CAPITAL UTOPIA MEETS THE MESSY HUMAN REALITY

Abstract ID: 186

Individual Paper Submission

YOUNG, Arica [Virginia Tech] arica2@vt.edu, presenting author
BUEHLER, Ralph [Virginia Tech] Ralphbu@vt.edu, co-author

Planning and social theorists from Jane Jacobs (1993) to Robert Putnam (2000) theorize that social capital is important for individual and community well-being. Multiple studies suggest communities with a significant amount of social capital may offer residents benefits ranging from improved physical and mental health to greater access to employment opportunities through their social ties. Based on the perceived positives, planning practitioners, social theorists, and local policy makers increasingly have sought to create communities that foster social capital. DeFilippis (2003) and Coleman (1988) suggest social capital, like other forms of capital, may not be equally distributed – nor may those who possess it choose to share it broadly. My paper explores an assortment of factors potentially shaping the presence and effects of social capital in a residential community in suburban Washington, DC, the Blueberry Hill Cohousing Community (BBHC). BBHC is nearly 20 years old with 19 single-family homes and 60 residents (adults and children).

Cohousing, a planning approach developed in Northern Europe in the 1960s, is grounded in using a mix of physical design, community self-management, and social activities to ensure residents' social interactions build ties, resulting in a community with abundant social capital. The original builder-residents of BBHC chose to design and live in a cohousing community due to the approach's critique of and response to modern American community design as isolating residents. American architects, Kathryn McCamant and Charles Durrett introduced cohousing to the United States in the late 1980's, yet currently there are only 165 completed communities and cohousing remains a little-known planning approach. Correspondingly, the research literature is limited in scope. Currently, the literature has a lack of data on: the functioning of non-hierarchical systems and self-management processes; how do cohousing proponents and residents acknowledge and manage power relations; and how do the communities adapt over time to new residents. This last factor is important to understanding cohousing longer-term. The initial resident-builders had to dedicate considerable time and monetary resources to bring the community to fruition. New residents do not enter the community with that perspective.

This paper seeks to illuminate some of these issues through the lens of BBHC. Over a five-month period, I examined how social capital develops in cohousing and these residents' perceptions of living in a community designed and managed by cohousing precepts. I conducted open-ended, qualitative interviews with 15 current and former residents ranging in age from 18 to mid-80s. All were college-educated and economically middle-class, and all, save two, were Caucasian. In addition to interviews, I participated in community meals and management meetings; documented the community through photography and wrote memos. Prior to the 5 months, I spent two separate 2-month periods, one in 2011 and another in 2012 at BBHC conducting research to examine environmental sustainability in cohousing and to explore the motivations driving cohousing as a movement. I gathered data using open-ended, qualitative interviews with residents and other individuals involved in cohousing, and participated in workshops, conferences, and tours of Mid-Atlantic cohousing communities located in suburban, urban, and rural locations. The findings from that data allowed me to refine this paper's research questions and designs, shifting from environmental to social sustainability. The data from all research stages informs this paper.

My research suggests that DeFilippis and other theorists' criticism that social capital is not necessarily a win-win is with merit. Social capital can be unevenly distributed or deliberately withheld, even within a small community. The findings also suggest that although cohousing stresses the use of consensus decision-making and non-hierarchical management, interpersonal relations, power dynamics, and in-group/out-group interactions can dramatically alter the original intent of the community's decision-making processes.

ASSESSING THE QUALITY AND IMPACT OF THE CONSOLIDATED HOUSING PLAN

Abstract ID: 193

Individual Paper Submission

TRAN, Tho [Texas A&M University] ductho2211@tamu.edu, presenting author

VAN ZANDT, Shannon [Texas A&M University] svanzandt@arch.tamu.edu, co-author

Housing plays a central role in connecting individual, family, and society in human life. Provide decent housing at an affordable price, in a suitable living environment is the ultimate goal of housing policy in the United States, as well as many other countries. The U.S. Department of Housing and Urban Development (HUD) creates a financial mechanism that requires the submission of a Consolidated Housing Plan to support affordable housing development and other housing-related activity in a city, as a condition of receiving funding through the Community Development Block Grant (CDBG) and HOME Investment Partnership (HOME) funds). These funds are used to support the proposed affordable housing development agenda of the local jurisdiction. The plan plays a crucial role in increasing affordable housing choice and quality for local people, especially for low-income households. Yet little research undertakes an evaluation of plan quality for Consolidated Housing Plans. Only two studies that tackled the housing issue in plan evaluation literature were found in a thorough literature search, and the most recent one was published a decade ago. More importantly, the impact of Consolidated Housing Plan has never been assessed.

This research develops evaluation protocol by which Consolidated Housing Plans may be assessed, based on a thorough review of academic journals, legal documents, and best practices identified in the housing literature. It then applies to more than 50 cities in the U.S. Using four major criteria including Decent Housing, Suitable Living Environment, Economic Opportunity, and Fair Housing. The paper assesses the quality of Consolidated Housing Plan by applying the grading approach used in plan evaluation literature. Each plan will be evaluated based on five components: Factual basis, Goals, Policies, Implementation, and Participation. The total score represents overall quality of the plan. The results demonstrate the correlation between the criteria and components of the plan and the outcomes in real life. By examining the change in different groups of housing tenure and household income, this study will reveal the impact of Consolidated Housing Plan on renter/owner or low-income/high-income population

After that, three cities, represented high-, medium-, and low-score in plan quality, are randomly chosen for neighborhood-level analysis. For each city, we apply spatial statistics analysis for Census Tract data to scrutinize the concentration of low-income population in the local neighborhoods. Then, using points data of affordable housing and community development activities for density analysis, we show the spatial pattern of these federal housing programs. The mismatch between the location of needed population and where the public money goes shed the light on the effectiveness of Consolidated Housing Plan. The findings also suggest further studies on the link between plan preparation and implementation process. These raise some serious questions about the way we use public money as well as how to effectively plan and implement planning documents. Finally, the findings are expected to create guidelines not only for policymakers but also for local authorities and researchers in supporting the affordable housing and community development nationwide.

ADAPTIVE MANAGEMENT: NONPROFIT HOUSING DEVELOPMENT ORGANIZATIONS DURING THE GREAT RECESSION

Abstract ID: 194

Individual Paper Submission

WONG, Karna [UC Irvine] karna.wong@uci.edu, presenting author

Nonprofit developers have struggled for many years to maintain adequate capital and operating reserves to preserve their affordable housing stock (Bratt, R. G., Vidal, A. C., Schwartz, A., Keyes, L. C., & Stockard, J., 1998). These financial issues worsened during the Great Recession; in fact, nonprofits experienced unprecedented financial strain as demand for their services increased (Anheier, 2007; Johnson, 2011). While these conditions affected nonprofits throughout the country, the degree of impact varied across places due to contextual differences. In California, for example, financial stress for nonprofit developers was exacerbated by the 2012 elimination of local redevelopment funding. Within this harsh environment, nonprofit housing developers in California responded by implementing adaptive management approaches.

Adaptive management is typically used for environmental resource management and not for low-income housing development and related services. Moreover, management scholars acknowledge some of the inherent challenges in the adaptive management model and propose related approaches, such as dynamic strategic planning. Walters (1986), a proponent of adaptive management, suggested that managers use an iterative process because of the uncertainties of managing renewable resources. Favoring a dynamic strategic planning approach for technology and engineering projects, Neufville (2000) recognized the risks associated with forecasting the future and recommended building flexibility into a plan designed with long-term benefits and short-term objectives. Adaptive management and its variants were developed for fields seemingly very different from nonprofit housing development. Nonetheless, some nonprofit developers in California adopted practices from adaptive management to cope with the financial crisis beginning in 2007.

This research examines the management practices of nonprofit housing developers in California during a period of severe financial strain. Following on my quantitative analysis of data from over 800 nonprofit developers in the state, this research draws upon in-depth interviews with 18 executive directors and managers of nonprofit developers and housing associations in California. This research reveals that funding cutbacks on all levels of government (federal, state, and local) compelled some nonprofit developers to rethink standard organizational practices and strategically manage their housing development pipeline, real estate portfolios, staffing levels, programs, and services. Organizations that survived and performed well implemented adaptive management and dynamic strategic planning regarding funding and organizational structure. The lessons learned and management tactics from these developers can inform other organizations about how to cope during tough economic times.

ABANDONMENT AND QUALITY OF LIFE: A COMPARISON OF URBAN AND SUBURBAN AREAS

Abstract ID: 206

Individual Paper Submission

LEE, Ryun Jung [Texas A&M University] ryunjunglee@gmail.com, presenting author

NEWMAN, Galen [Texas A&M University] gnewman@arch.tamu.edu, co-author

DAY, Wayne [Texas A&M University] waynecday@tamu.edu, co-author

Excessive structural abandonment is typically associated with negative neighborhood perception. Additionally, abandoned structures can decrease nearby housing values and economic potential, further increasing the risk of neighborhood decline. Both scenarios can lead to degraded quality of life, which the Broken Windows Theory explains as negative consequences of abandonment. While the existing literature generally supports these positions, how abandonment contributes to quality of life has not been comprehensively examined in these studies. Further, these studies have concentrated primarily on only urban areas. While abandonment is known to be a major issue in declining urban areas, recent trends also show that suburban areas also experience abandonment. However, the effects of abandonment may not be the same when comparing urban settings to suburban areas. The varied effects of abandonment in suburban and urban neighborhoods have not been fully examined yet.

This study aims to 1) measure the effects of abandonment on quality of life using neighborhood satisfaction and housing values as a proxy and 2) compare these effects in suburban and urban areas, using American Housing Survey (AHS) data for the 20 largest U.S. Metropolitan areas. While abandonment has primarily been measured at the neighborhood scale in many studies, municipal and metro-scaled comparative measurements are rare. AHS abandonment data creates an opportunity to examine the effects of abandonment on quality of life using microdata, but applied to a national scale.

Neighborhood abandonment was measured using the AHS questionnaires on abandoned structures and boarded-up windows within 1/2 block of where the respondents reside. As noted, quality of life was measured using 1) neighborhood satisfaction scores and 2) economic benefits – to measure both perceptual and economic aspects that promote quality life. Residents' satisfaction of the neighborhood was identified using the neighborhood ratings from AHS. Respondents are asked to rate surrounding neighborhood conditions on a scale 1 to 10. Economic benefits were identified using self-recorded home values. Property values can also represent the economic risk that can lead to neighborhood decline when the property values decrease. To measure the effects of abandonment on neighborhood satisfaction and property values, two regression models were specified separately. Through these models, the effects of multiple types of abandonment (i.e. a single abandoned structure vs. severe abandonment) were analyzed. Then, the responses in suburban areas were delineated from urban areas to examine and compare the different effects of abandonment.

Results indicate that abandonment decreases the quality life in terms of both neighborhood satisfaction and property values. Also, the effects are larger in suburban neighborhoods than urban areas. Specifically, an abandoned structure in a suburban area is likely to decrease neighborhood satisfaction by 0.65 ~0.68 score more and decrease property values by 17.8K~20.5K U.S. dollars than an urban area. The effect size becomes larger when the neighborhood has more severe abandonment. This study implies that abandonment in suburban areas shows a greater negative impact on the quality of life than urban settings. At the same time, urban areas show lower neighborhood satisfaction than suburban areas. Despite the efforts of cities to achieve quality of life in urban areas over time, results are indicating that suburban neighborhoods bring a higher satisfaction than urban

areas. This study contributes to bringing attention to suburban abandonment and extends the understanding of the impact of abandonment on the quality of life.

WHAT DO REPORTED EXPERIENCES OF HOUSING DISCRIMINATION TELL US ABOUT SEGREGATION AND DISPARITIES IN MENTAL HEALTH OUTCOMES? A SOCIO-SPATIAL ANALYSIS OF THE MILWAUKEE MSA, 2009-2013

Abstract ID: 214

Individual Paper Submission

CANCEL MARTINEZ, Yaidi [University of Wisconsin Madison] cancelmartin@wisc.edu, presenting author
MORALES, Alfonso [University of Wisconsin-Madison] morales1@wisc.edu, co-author
MALECKI, Kristen [University of Wisconsin-Madison] kmalecki@wisc.edu, co-author

Do reported experiences of housing discrimination when accessing housing or remaining in the neighborhood influence segregation and disparities on mental health outcomes? Our study revisits this question and expands the discourse on housing discrimination and health.

This year we commemorate 50 years of the Fair Housing Act. However, cities across the US show gaps in racial integration suggesting a pervasive socio-economic mismatch that translates to health disparities (Osypuk & Acevedo-Garcia, 2010; Yang & Matthews, 2015). The Milwaukee metropolitan statistical area (MSA) ranks among the most segregated US metropolises and research suggest gaps among income and racial groups intensified Post-Recession (Levine, 2013).

Using 2009-2013 data from the Survey of the Health of Wisconsin in the Milwaukee MSA (N=559) and spatial data on housing and demographics, we employ a multi-leveled approach incorporating generalized regression analysis and spatial modeling developed by Lehmann et al. (2003). We explore potential associations between reported experiences of housing discrimination and self-reported mental health outcomes including stress, anxiety and depression (SAD). We also explore moderating effects of residential disadvantages based on housing and neighborhood quality indicators, and dimensions of racial segregation as defined by Yang and Matthews (2015).

Initial findings suggest that experiences of housing discrimination are associated with residential disadvantages and each SAD outcome after controlling for general health status and socio-economic characteristics. Variabilities are observed among different racial/ethnic groups and income levels suggesting that dimensions of racial segregation may play an influential role on the relationship between experiences of housing discrimination and mental health outcomes. Further analysis examines whether spatial dependence influences our understanding of the associations between each dimension of residential segregation and SAD.

This research expands our understanding on the prevalence of housing discrimination while also suggesting its potential ripple effects on residential disadvantages, segregation, and disparities in mental health outcomes. Findings from this study provide valuable information to inform future policy and advance fair housing by

underscoring the influential role of experienced housing discrimination on the quality of life and mental health of residents. Lastly, this research provides grounds to build new approaches and advance knowledge interconnecting the fields of urban planning and public health.

DECLINING ACCESS TO AFFORDABLE LOW-INCOME HOUSING DUE TO MIDDLE-CLASS COMPETITION: EVIDENCE FROM US METROPOLITAN AREAS, 2006 TO 2016

Abstract ID: 228

Individual Paper Submission

PARK, JungHo [University of Southern California] junghopa@usc.edu, presenting author

Rental affordability is worsening in many metropolitan areas during and after the Recession. The prevalence of cost burdens among lower-income renters is due in part to the fact that households with moderate or even high incomes take the units that lower-income renters could afford. In 2016, 44.2 percent of the low-cost rentals that Extremely Low-Income (ELI) households (earning less than 30 percent of area median income) could afford were occupied by higher income households and consequently unavailable. Thus, the underlying challenge in rental affordability is not only the shortage of affordable supply at the 30-percent-of-income standard but also the actual occupancy by the poorest renters, particularly in the largest metros.

JCHS (2017) reports that many metros experienced declines in their stocks of low-cost rentals in both absolute count and relative shares during and after the Recession. In the face of declining supply of low-cost rentals, examining rental availability is important for helping planners and policy makers determine ways to expand housing opportunities for the poorest renters.

The objective of this study is to examine how many of low-cost rentals that ELI renters could afford were occupied by higher income households and what metropolitan factors have limited or expanded this rental availability in some metros more than in others. In the private market, higher income households are free to occupy rentals that are affordable to ELI households, but it largely depends on an adequate supply of middle- and high-cost rentals which widely varies across metros. Subsidized rentals, in contrast, are occupied by the poorest households – available to them through income restrictions. With focus on housing subsidies and higher income households' demand, this study runs regression models to determine the factors most strongly associated with rental availability.

Using 2006 through 2016 American Community Survey microdata, this study measures the scale of rental units that are affordable but unavailable to ELI households in each metro – where available is defined as actually occupied by a household at or below the ELI income threshold. A sample of the 200 largest metros was used to study rental availability trends across housing markets in bust (2006-2011) and recovery (2011-2016) periods, as well as the entire decade.

This study estimates housing availability in regards to ELI renters in particular because the poorest group is the last in line to find housing and the primary target population for rental subsidy programs. Higher income

households were categorized into income groups, very low (30-50% of AMI), low (50-80%), moderate (80-120%), and above moderate (more than 120%), to capture which group takes the most rentals that could be affordable to ELI households.

Nationwide, 52 units are affordable for every 100 ELI renters in 2016. Applying the availability dimension, only 29 are occupied by ELI renters while 23 are occupied by higher income renters. Findings show that the scale of unavailable rentals is markedly greater in some metros. Acute rental availability problems are concentrated in areas where income levels are high – San Francisco, San Jose, and Boston.

Regression results highlight the importance of increases in housing supply in all rental brackets, easing rental competition in the higher-end brackets and opening availability of low-cost housing to ELI renters. Evidence shows worse availability of low-cost rentals in metros with more serious shortfall of middle- and high-cost rental supply relative to higher income households' demand. This implies fierce competition for limited higher-end units is accompanied by a consequent increase in higher-income occupancy of low-cost units. In addition, affordable rentals also were more available to ELI households in metros with more subsidized units, specifically Public Housing that serves less affluent renters than other programs.

PARTICIPATION AS A TWO-WAY STREET: SMALL ORGANIZATIONS LEARNING FROM COMMUNITIES IN INTERNATIONAL DEVELOPMENT

Abstract ID: 248

Individual Paper Submission

CONTRERAS, Santana [The Ohio State University] contreras.78@osu.edu, presenting author
ROUDBARI, Shawhin [University of Colorado Boulder] shawhin@colorado.edu, co-author

Discussions surrounding participation have been frequent and have dominated much of planning research and practice. These discussions often frame participation in a unilateral manner focusing on the ways in which communities are impacted by participatory exchanges with organizations, governments, and larger institutions. However, in the implementation of participatory activities, there appears to be frequent instances of two-way exchanges, where community members are not mere beneficiaries of participation but have important impacts on the external individuals and organizations guiding these participatory engagements. In alignment with critiques presented by scholars dating back to Arnstein, the question these interactions present is whether these two-way exchanges are examples of cooptation or does the communities' ability to initiate larger organizational change provide evidence of a movement towards transformative participation? In an effort to assess these questions, this study explores two-way flows of expertise and knowledge transfer between organizations and communities. We examine this through a qualitative assessment of small Colorado-based non-profit organizations working on built environment projects with local communities in the global south. Through in-depth interviews with organizational representatives and observations of organizational events in the Colorado metro area, we find that small organizations exhibit forms of two-way exchanges due to their unique and nuanced relationships with community partners. We present emerging themes related to these engagements that suggest the need for rethinking the

unilateral framing of participation frequently presented in planning discourses. The results of this research aim to enrich planning scholarship by expanding our understanding of participatory engagements in an effort to improve how engagement activities with local communities in developing communities are framed and implemented in practice.

HOUSEHOLDS, HOUSING, AND NEIGHBORHOOD DETERMINANTS OF COMMUNITY PARTICIPATORY SOCIAL CAPITAL

Abstract ID: 262

Individual Paper Submission

LI, Yanmei [Florida Atlantic University] yli22@fau.edu, presenting author

Community social capital is defined as a “multidimensional construct” where individuals collectively utilize social networks and trust to achieve common community goals and collective efficacy (Putnam, Leonardi, & Nanetti, 1993; Xu, Perkins, & Chow, 2010). Perkins and Long (2002) classified social capital into four dimensions: Sense of community, neighboring, citizen participation, and collective efficacy. Each of these may lead to the next dimension; for example, strong sense of community often results in formal or informal neighboring behavior and increased citizen participation and organizing. The 2013 American Housing Survey (AHS) measured 21 social capital variables spanning five dimensions of social capital: Social cohesion and trust (sense of community), neighborhood social ties (sense of community), shared expectations for social control (neighboring), organizational involvement (formal citizen participation), and volunteerism (informal citizen participation). The majority of the survey respondents indicated strong social cohesion and trust and strong neighborhood social ties. However, formal or informal citizen participation in collective decision making at the neighborhood level is much less prevalent. Few actively intervened with neighborhood problems. This indicates that strong sense of community is not necessarily leading to increased citizen participation and neighboring behavior. Other factors may have prevented higher levels of participation among residents who otherwise are satisfied with their neighborhoods.

Putnam (2000) expressed concerns about declining social capital and deteriorating social disengagement in the contemporary American Society. The preliminary results from the 2013 AHS national survey data indicates that social disengagement is prevalent among the survey respondents. Therefore, it is imperative to explore the determinants of community participatory social capital, which is reflected through social engagement/disengagement.

This paper uses the 2013 American Housing Survey data, which is the only national level data including social capital variables to date, to explore how household characteristics (such as gender, race, income, education, marital status, age, and length in the neighborhood), housing attributes (for example, tenure, housing value, size of the house), and neighborhood characteristics (such as land use mix, physical features, and satisfaction with neighborhoods) relate to community participatory social capital. The community participatory capital measures

whether the survey respondents belong to a civic organization, attended neighborhood meetings, and/or volunteered in the past twelve months. Participation in religious organizations and activities is not accounted for in this research since religious participation is high among the survey respondents.

Following basic descriptive statistics, selected households, housing, and neighborhood characteristic variables will be used in a series of regression models to measure how they relate to the level of community participatory social capital. Locational variables such as census region and central city/suburban status will be controlled as well. The results from this research will help us understand the determinants of community participatory capital and therefore find solutions to promote public participation and citizen engagement in the collective decision making process and urban governance of local communities and neighborhoods.

THE AFFORDABLE HOUSING CRISIS: CITY RESPONSES

Abstract ID: 265

Individual Paper Submission

KEATING, W. Dennis [Cleveland State University] w.keating@csuohio.edu, presenting author

The United States has a serious shortage of affordable housing, especially for low-income tenants. Yet, the Trump administration's U.S. Department of Housing and Urban Development (HUD) has proposed a significant budget cut in programs providing affordable housing (e.g., Housing Choice Vouchers and Public Housing). Also, the recently passed federal tax cut seems likely to reduce the number of affordable housing units produced through the Low Income Housing Tax Credit program. All of these programs already fail to provide enough units for the demand. On March 13, 2018, the National Low Income Housing Coalition (NLIHC) announced a national shortage of 7.2 million affordable rental units.

The theme of this paper is the efforts of cities, in the face of reduced federal support, to attempt on their own to address the lack of sufficient affordable housing for their residents. To answer this research question, relevant reports and newspaper articles have been reviewed. This shortage of affordable housing and municipal responses are important to practicing planners who deal with housing issues. In early 2018, the Boston University Initiative on Cities released its annual Menino Survey of Mayors with responses from the mayors of 115 cities with populations of at least 75,000. More than half of these mayors said that high housing costs and an inadequate supply of affordable housing was their leading concern. Only 13 percent said that they believed that their city's housing stock meets the needs of local residents.

My preliminary research has focused on some selected major cities with very serious affordable housing crises and their responses. This paper will review and analyze the magnitude of the affordable housing crisis in these cities, responsive municipal policies and programs, and their impact in relation to identified affordable housing needs. These selective cities are:

Detroit: Facing widespread housing abandonment due to its massive population loss and the highest poverty rate of major cities, Detroit in March, 2018 announced the creation of an Affordable Housing Leverage Fund of \$250 million to preserve 10,000 existing units and to develop 2,000 new units within the next 5 years.

Los Angeles: Faced with a growing homeless population, in 2016 voters approved a \$1.2 billion homeless bond issue to address aspects of this crisis. In December, 2017, Los Angeles passed an Affordable Housing Linkage Fee policy expected to raise \$100 million annually.

New York: In 2014, Mayor De Blasio announced a plan with a goal of preserving and developing 200,000 units of affordable housing by 2024. He has revised this goal to 300,000 units by 2026. The city is using mandatory inclusionary housing and upzoning some neighborhoods, as well as providing financing and city-owned land.

Portland (Oregon): Beginning in 2015, Portland has declared a housing emergency due both to an inadequate supply of affordable housing and also to a serious homelessness situation. In 2016, voters approved a \$258 million affordable housing bond. The city has also recently adopted inclusionary housing.

San Francisco: The city with the most expensive housing in the mainland U.S. has attempted to address the affordable housing and homeless crisis through rent stabilization, upzoning some neighborhoods to promote building of up to 10,000 new units, and funding affordable housing through its linkage policy.

Seattle: Its new Mayor Durkin says that affordable housing is her primary policy issue. In December, 2017, she announced a \$100 million investment in construction of projects. An upzoning of several neighborhoods is proposed.

Some of these municipal responses are very recent and their impact will be more difficult to assess than those that have been in place for awhile.

CONSPICUOUSLY CONSUMED McMANSIONS: AN EXAMINATION OF THE EFFECTS OF RELATIVE HOUSE SIZE ON HOUSE PRICES

Abstract ID: 267

Individual Paper Submission

CHARLES, Suzanne [Cornell University] slc329@cornell.edu, presenting author

Veblen (1899) identifies the need in a consumer-oriented society to outwardly express success through what he terms “conspicuous consumption”—expenditures on goods and services that are motivated by the public display of wealth and status. Hirsch (1976, p. 2) identifies these conspicuously consumed goods as “positional goods,” which he defines as those for which “the satisfaction that individuals derive from goods and services depends in increasing measure not only on their own consumption but on consumption by others as well.” The evaluation of a positional good is based largely on its context and how it compares to the goods consumed by others (Frank, 1985). The increase in status that comes with possession of a positional good is made at the expense of others, whose status declines in relative terms (Easterlin, 1995; Frank, 1985).

“McMansions” are a conspicuously consumed good. Defined by Merriam-Webster (2018) as “a very large house built in usually a suburban neighborhood or development; one regarded critically as oversized and ostentatious,”

McMansions often draw the ire of their neighbors, who argue that they destroy the collective neighborhood character, diminish light and privacy, and decrease neighboring property values. Consequently, many suburban municipalities have taken steps to regulate their form. But despite the often critical reception from neighbors, there continues to be demand for McMansions in many suburban areas. Building on Frank's (1985, 2007) work, Solnick and Hemenway (2005) and Charles (in-press) empirically substantiate McMansions as a moderately positional good. In this study, I examine the price that individuals place on the positional aspect of McMansions.

This study examines whether housing consumers are willing to pay a premium for positional McMansions and whether the relatively older and smaller houses adjacent to McMansions sell at a discount. Using observed single-family house sales in the suburbs of Chicago from 2010 through 2015, I employ a spatial hedonic price model to determine willingness-to-pay estimates for positional McMansions as well as their nonpositional neighbors. The local policy and regulatory implications of the findings are discussed.

UPWARD MOBILITY OR DISPLACEMENT? TRACKING HOUSEHOLD MOVES AND ASSESSING DESTINATION OUTCOMES

Abstract ID: 292

Individual Paper Submission

RODNYANSKY, Seva [University of Southern California] rodnyans@usc.edu, presenting author

Intra-city phenomena such as gentrification and displacement are often observed, understood and studied quantitatively at the neighborhood spatial scale. Yet, neighborhoods are made up of households and individuals who through their actions guide the trajectory of a neighborhood. This paper analyzes the extent, timing, and quality of household moves in neighborhoods where an amenity – in this case, a new rail transit station – is introduced. Is there inequality in mobility: which moves represent upward mobility and which represent displacement? What household characteristics are associated with an upward move, which with displacement?

Previous mobility choice literature has uncovered numerous covariates correlated with mobility, including life course and employment events, socioeconomic, educational, and ethnoracial characteristics (e.g., Clark & Davies Withers, 1999; South & Crowder, 1997; van der Vlist et al., 2002). In this paper, I examine whether households are more likely to move in a transit-oriented neighborhood (TOD) after a new rail station is introduced, controlling for the covariates previously found in the literature. This analysis will also confirm the previous findings on mobility covariates in the Los Angeles County context. Additionally, I examine the timing of the move relative to the introduction of the rail station amenity. I measure mobility using a unique dataset of tax filers in Los Angeles County over 21 years at the block level.

To assess move quality, I look at the outcomes of these residential moves across the income distribution: Do these moves constitute a relative improvement in welfare (i.e., upward mobility) for lower-income households or a displacement to a worse neighborhood? I operationalize this measure by comparing public school quality, transit access, and retail banking density in origin neighborhoods versus destination neighborhoods for households who move. Multiple studies have found that school quality and transit access capitalizes into neighborhood housing

prices (e.g., Kane et al., 2006; Bartholomew and Ewing, 2011). These three measures capture relative amenity quality changes in which can be measured annually, to correspond with the mobility data.

This research uses combines unique datasets to illuminate germane research questions on the inequality of mobility. Analyses using these datasets contribute to data-driven decision-making and plan development in improving outcomes for households and neighborhoods. Additionally, studying and analyzing mobility will help planners make better forecasts.

THE INFLUENCE OF THE COMMUNITY BENEFITS AGREEMENT PHENOMENON ON URBAN POLITICAL THEORY

Abstract ID: 304

Individual Paper Submission

ROSADO, Ralph [FIU] ralph@ralphrosado.com, presenting author

Since 2001 in select cities, local and occasionally national organizations have argued that development projects should significantly improve the lives of affected residents. Community groups, labor unions, and other organizations in several US cities are entering into community benefits agreements (CBAs) with developers and/or governmental bodies, in order to address community needs, including parks, low-income housing, and job training, among other public benefits. In return, the groups support the projects' requests for governmental approvals or subsidies.

Adopting a multiple case study methodology, this study analyzes and compares twenty-four (24) major attempts by community groups to secure public benefits as part of development approval processes in California, New York, Wisconsin, and Florida, and asks the question, How does the CBA phenomenon shape our knowledge of urban political theory? It finds that the influence of any entity depends on whether that individual or organization sets out to block a particular development project from coming to fruition, initiate a development project or shape development that is being proposed. It reveals that different schools of urban political theory are most relevant depending upon the primary goal of those involved in the development process, as reflected by markedly different pyramids of power.

When it comes to blocking development, the study finds that influence is widely dispersed, thereby supporting the pluralist school of thought: developers can choose to terminate a project, while elected officials can block projects from moving forward to construction. Yet individual neighbors and organized groups can hold great sway as well, if they choose to argue that a project is not compatible with a neighborhood. Normally inactive citizens can quickly mobilize if aroused and thereby block a project.

With regard to initiating development, however, developers and elected officials – both of whom can fairly easily secure land and funding – overpower neighbors and other stakeholder organizations. As a result, in this scenario

the elite-reputational school of urban political theory, which argues that in most cities a small group of leading businessmen control the actions of local government - best captures the power dynamics at play.

In the third development scenario - in which various entities attempt to shape development, by altering its physical form and/or overall character - developers and elected officials still hold the most sway. The former can choose to change the character of their projects, while the latter can hold their support hostage unless a project is modified to address their concerns. Yet other entities can exert sufficient pressure to result in considerable modifications to a project. Individual neighbors acting alone can occasionally influence a development scheme. More effective than that is the volunteer-based neighborhood association, which is better able to mobilize efforts through pre-existing channels of communication. Interest groups - developed around shared concerns and with paid staff that can devote time to lobbying policymakers and cultivating supporters – are more efficacious still. In the civic sphere, the most influential shaper of development projects is a coalition of each of the aforementioned entities.

In the context of shaping development, through the pursuit of community benefits agreements, public choice theory proves most accurate and enlightening. This theory probes how individuals join together effectively in pursuing common goals, as well as why people organize better for some causes than for others. It has been proven that government decisions greatly favor small, well-mobilized groups that work together for “collective action.” Indeed, the emergence of CBAs in select locales by relatively small but savvy groups supports this notion.

THE CHANGING VALUE OF “VACANCY”: HOW THE EMERGENT SHARING ECONOMY DISPLACES IMMIGRANT SHARING IN LOW-INCOME LOS ANGELES.

Abstract ID: 317

Individual Paper Submission

KIM, Anna [Georgia Institute of Technology] anna.kim@gatech.edu, presenting author
SARMIENTO, Carolina [University of Wisconsin-Madison] bailaluna@gmail.com, co-author

Airbnb is the largest of the short-term rental (STR) platforms and accounts for approximately 65 percent of the Los Angeles short-term rental market (Samaan, 2015). This article examines how this growing presence of Airbnb in low income immigrant communities connects to the processes of gentrification and displacement and represents a differentiated strategy of particular actors to restructure the housing market. In particular, we are interested in how the simultaneous creation and re-commodification of “vacancy” in the housing market, via home-sharing websites like Airbnb, both excludes and threatens immigrant-dense neighborhoods in Southern California through gentrification without development. Many immigrant working-class neighborhoods undergoing gentrification are indeed “vital” economies and possess viable social networks that function to meet the needs of their populations.”^[1] “Sharing” becomes a necessary strategy to meet their housing, employment and

mobility needs when facing increased uncertainty due to poverty, discrimination, racism, and lack of legal status. Overcrowding becomes a function of this type of “sharing” necessary to survive in a tight housing market.

MIGRANT HOUSING CONSUMPTION AND LIVING CONDITIONS IN URBAN CHINA

Abstract ID: 327

Individual Paper Submission

WEN, Christine [Cornell University] hw495@cornell.edu, presenting author

WALLACE, Jeremy [Cornell University] jlw397@cornell.edu, co-author

This article investigates the determinants and geographical variations of migrant housing consumption in urban China using the 2015 China Household Finance Survey (CHFS) – the most comprehensive dataset of its kind to date. The central question is what kinds of migrants, and where, are more likely to spend more on rental housing, purchase housing, and live in better conditions. Higher housing consumption for migrants can indicate an inclination to establish themselves in the city as permanent residents. It is well-known that migrants in China still face limited housing options in the city due to institutional discrimination, but we do not yet know all the fine grains. Existing studies on migrant housing are limited to a few cities or the use of census and other aggregate data only. This article avails of the extensive details and areal scope of the CHFS survey data to explain the variations in housing consumption among migrants.

Three OLS models are run for rental cost (relative to the city's median), housing ownership, and a composite index of housing quality constructed by the author (dependent variables). The unit of analysis is the individual migrant between the ages of 18 and 65. The primary independent variables are at the individual, household, and regional levels. Individual-level explanatory variables include hukou status (a residency status which determines access to public services and other benefits – for example, interprovincial vs. intraprovincial, urban vs. rural, etc.), employment circumstances (not including wage), length of residence in the current city, access to social security benefits (in either place of origin or residence), and access to bank loans. Household-level variables include the number of working household members and dependents. Regional-level variables include the concentration of migrants in major cities of the province (using data author from the 2010 census and annual statistical yearbooks), an original migrant-local disparity index, and the level of urbanization. The individual's education, income, and other financial assets, including ownership of additional properties, are controlled.

The housing quality index is constructed based on dimensions which were considered important in existing studies: affordability (housing cost relative to income), space, basic amenities (gas, plumbing, heat, electricity, water), locational desirability (distance to work), and type of tenure (formal vs. informal). The want of any one of these five attributes creates distress on a migrant's living condition and well-being. By contrast, better housing conditions are conducive for successful integration into city life.

Preliminary findings indicate that being an intraprovincial migrant in the eastern provinces is positively associated with both ownership and housing quality but shows no relationship with rental cost. Urban migrants are more likely to purchase housing and spend more on rental than rural migrants. Migrants with spouses working in the same city are likely to live in better conditions. Length of residence in the current city is positively associated with housing quality but has no relationship with housing ownership. Other (expected, as this research is still underway) findings include: stable employment encourages higher spending on housing but not necessarily housing purchase; lower levels of urbanization may be associated with higher rates of housing ownership among urban migrants but lower among rural migrants; urban migrant households with school-age children are more likely to own housing, while rural migrant households with school-age children are more likely to live in poorer conditions.

This article contributes to planning practice by identifying differences within the migrant population so as to suggest more tailored housing policies. It may also contribute to urbanization studies as well as housing studies in general through a more fine-tuned understanding of the causes of housing disadvantage for a city's newcomers.

MILLENNIALS' UNBALANCED RECOVERY FROM THE RECESSION: JOB GROWTH BUT HOUSING SHORTAGE

Abstract ID: 347

Individual Paper Submission

MYERS, Dowell [University of Southern California] dowell@usc.edu, presenting author
PARK, JungHo [University of Southern California] junghopa@usc.edu, co-author

This study reports new evidence on Millennials' progress of recovery following the Great Recession, finding a great imbalance between improvements in local job and housing markets in the nation. With Millennials born between 1981 and 1999, the older segment were ages 22 to 27 in 2008 when the recession shock began and their early housing and employment careers were sharply impeded. In contrast, the middle Millennials, ages 16 to 21 in 2008, and 24 to 29 by 2016, were not immediately affected but may have been slowed in their career development, depending on the speed of local job and housing recovery. Finally, the youngest Millennials, ages 10 to 15 in 2008, and 18 to 23 by 2016, were little affected in employment but may suffer from the continuing housing shortages. Thus it is important to identify relevant age segments among Millennials, as well as the differential effects of employment and housing. In general, employment growth rebounded first and is continuing rapidly, while new construction and homeownership are sluggish in recovery, a little less so for household formation. These contradictory trends are clearly presented by the annual ratio of job growth to building permits, from 1980 to 2017, in the nation and across the 100 largest metros.

Against the background of metropolitan BLS employment and Census Bureau building permits data, this study uses ACS annual data to trace the recovery of Millennials of different ages. Analysis consists of descriptive displays of rates of behavior in housing and employment by each age group observed every two years. These show the downturn after 2006, the bottoming out in 2010 for employment (later for housing), and the gradual upturn toward 2016. We also will observe the trends in marriage and BA attainment which have prominent

influence in shaping behavior in housing and employment.

The second stage of analysis aggregates larger age ranges covering the older, middle, and younger Millennials, calculates the descriptive downturns and recoveries, and displays this to show their distribution across the set of metro areas. (Aggregation is needed to reduce sampling noise in smaller metro areas.) The third stage then proceeds to statistical modeling of variations across the 100 largest metro areas. Model 1 treats post-2010 increases in household formation as the dependent variable, with right side variables of post-2010 changes in employment and housing construction, plus controls for changes in % married and % with a BA. (Models are repeated for each specific age group.) Model 2 substitutes, on the right side, the post-2010 ratio of total jobs added to total housing permits in place of the two separate variables of employment and housing.

Preliminary results show that Millennials have made substantial progress in both employment and household formation since 2010. Employed Millennials made greater progress than the nonemployed. However, the employment effect was more weakly observed in metros with a serious shortfall of new construction relative to rapid job growth. Findings emphasize the importance of balance between job growth and housing growth in shaping recovery from the recession. Actual housing permits are compared to what would be expected if the local long-run ratio of permits to jobs added prevailed. Planners have a much greater responsibility in managing housing growth than employment growth. This study suggests they need better goals for assisting housing production, and the relative shortage of housing should be calculated in relation to job growth in each metro area, as we demonstrate.

AFFORDABLE HOUSING AND HISTORIC PRESERVATION: ANALYZING THE COMBINED USE OF LIHTC AND RTC IN KANSAS CITY, MISSOURI

Abstract ID: 368

Individual Paper Submission

FRANK, Stephanie [University of Missouri-Kansas City] franksb@umkc.edu, presenting author

The Department of Housing and Urban Development and the National Park Service both tout the compatibility and popularity of combining the use of the Low-Income Housing Tax Credit (LIHTC) and the Rehabilitation Tax Credit (RTC) for certified historic structures. Despite this, there is little scholarship that examines the combined use of the credits. Missouri is one of the nation's leading states in the use of the RTC, thanks to a robust state RTC that can be layered with the federal credit. Until this year, Missouri also offered a state LIHTC. Changes to the tax incentive programs at the federal and state levels may threaten the continued combined use of the credits in Kansas City as a housing affordability crisis intensifies. Using publicly available information on projects and fieldwork, this paper analyzes the projects that combined the two credits to assess the success of these programs to solve two thorny problems in one application: the creation and preservation of affordable housing in an era of declining subsidies and increasing affordability crisis and the maintenance of our built heritage in an era of redevelopment of Kansas City's urban core.

GENTRIFICATION WITH A WHITE PICKET FENCE: NEIGHBORHOOD UPGRADING IN US SUBURBS, 1980-2016

Abstract ID: 376

Individual Paper Submission

FINIO, Nicholas [University of Maryland, College Park] nfinio@gmail.com, presenting author
KNAAP, Elijah [University of California Riverside] eknaap21@gmail.com, co-author

Ellen and Ding (2016) noted that “rigorous research on the extent, causes, and consequences of gentrification remains rare.” Gentrification is understood to be the process by which middle class families move into urban areas, causing an increase in property values, and displacement of other groups (Lees et al. 2008). We seek to expand understanding of gentrification, and argue that gentrification is a process of neighborhood change which can occur in any neighborhood regardless of its urban form, or location in a metropolitan area. The focus on urban areas in gentrification research has yielded a focus on dense neighborhoods within central cities, while ignoring less dense suburbs not within those jurisdictions. We ask a simple research question: are suburban places gentrifying? We identify suburban gentrification, and further its pathways over time, in the 25 largest US metropolitan areas from 1980-2016 at the census tract level.

Neighborhoods in metropolitan areas like Seattle, Los Angeles, Washington DC, and Chicago have experienced neighborhood change that meets most qualifications for gentrification: increasing home prices, changing demographics, upgrading education credentials, and increasing incomes. However, many of these neighborhoods are lower density suburbs, not the traditional, revitalizing urban core areas associated with the “back-to-the city movement” (Smith, 1979). These places generally tend toward having more single family homes, both attached and detached, and more open space than their urban counterparts. While their urban form may be different, these places are experiencing change that meets all the qualifiers for gentrification – except being located in dense urban areas.

We first limit our dataset to suburban census tracts (which proxy for neighborhoods) based on established methodologies (Forsyth, 2012). Neighborhoods are classed as suburban based on the type of housing stock dominant in the neighborhoods; this includes neighborhoods both within central cities and outside them that may be suburban in character. We also separate neighborhoods outside of central cities in bordering municipalities from those within the cities, in order to observe and discuss gentrification and policy implications in less familiar places. To observe gentrification as a process over time, neighborhoods are grouped using a clustering algorithm which sorts neighborhoods into groups based on race, income, home prices, and educational credentials of residents. We then utilize an unsupervised machine learning algorithm known as affinity propagation to identify trajectories of gentrification across decades. Gentrification is said to occur when a neighborhood switches from a clustering group of lower-income, lower-home value, more diverse and less educated place; into a clustering group one with higher home values, incomes, and educational credentials. This clustering method allows for

multiple “forms” of gentrification to occur and avoids strict threshold-passage definitions which can exclude some places arbitrarily.

We find that after a slow start in the late 20th century suburban gentrification has dramatically accelerated in certain metropolitan areas in the 21st - particularly in neighborhoods which are seeing education credential and home price increases simultaneously. We also find that suburban gentrification is much more prevalent in some metropolitan areas than in others. Our main finding is that gentrification spreads evenly across municipal boundaries into suburbs – Neil Smith’s flows of capital are not restricted by political boundaries. Our results should be of particular interest to planners in suburban municipalities and polities which are not traditionally considered battlegrounds for gentrification. Tools to prevent some of gentrification’s negative consequences, such as displacement, may need to take different forms in suburbs with higher homeownership rates, fewer rental units, and significantly less commercial real estate.

TO WHOM DO HOUSING POLICIES PROVIDE STABLE HOUSING? EVIDENCE FROM THE PANEL STUDY OF INCOME DYNAMICS

Abstract ID: 378

Individual Paper Submission

KANG, Seungbeom [The Ohio State University] kang.656@osu.edu, presenting author

As the shortage of affordable housing for low-income households has become commonplace in the United States, housing instability (Joint Center for Housing Studies of Harvard University, 2017), represented by frequent residential moves caused by housing-related hardships, has become a prevalent problem in the United States (Desmond, 2015). Despite growing evidence supporting the prevalence of housing instability, little evidence exists about the associations between federal housing programs, intended to provide stable housing to program participants, and their housing instability experience.

This study addresses several important questions that remain largely unanswered. If federal housing programs are designed to provide stable housing to program participants, does the stabilizing effect of housing assistance remain after program participants make their transition off the assistance? Does the stabilizing effect of housing assistance vary across housing programs? Who is more likely to suffer from housing instability when receiving or leaving the assistance? A better understanding of the varied associations between housing assistance and housing instability is important in the contemporary context of limited budgets for housing assistance in the United States (Collinson, Ellen, & Ludwig, 2016).

By analyzing the Panel Study of Income Dynamics (PSID) data from 1999 to 2009 combined with the Assisted Housing Database (AHD) and other secondary data, I explore associations between associations between housing assistance experiences, including receiving or leaving housing assistance, and subsequent housing instability based on 1,516 low-income renter households. By incorporating logistic regression models predicting the likelihood that a household experienced housing instability during a two-year period, I compare six different statuses associated with events of receiving and leaving federal housing programs: (1) Housing Choice Voucher (HCV) holders, (2) HCV leavers, (3) public or subsidized housing residents, (4) public or subsidized housing leavers, (5) other housing assistance recipients, and (6) unsubsidized income-eligible households.

This paper identifies three distinctive relationships between housing assistance experiences and subsequent housing instability. First, although receiving housing assistance, including receiving the HCV program and living in public or subsidized housing, reduces the likelihood of experiencing housing instability on average, HCV holders are relatively more likely to experience housing instability than participants of place-based programs. HCV leavers and public or subsidized housing leavers are much more likely to experience housing instability than participants of place-based programs. Second, the stabilizing effect of housing assistance remains only among non-Hispanic white households with secure jobs. African American households without secure jobs are likely to suffer from housing instability after they make the transition off the assistance. Third, among housing assistance leavers, relatively low-income, less educated, and insecurely employed, African-American households in certain life stages are more likely to experience housing instability after leaving housing assistance.

This study is the first empirical paper to examine varied associations between housing assistance experiences and subsequent housing instability based on the nationwide panel data. The combinations of housing programs and household characteristics that weaken the stabilizing role of housing assistance identified in this study would allow public housing authorities (PHAs) to dedicate limited slots to those who would most benefit from the programs. Moreover, comprehensive housing programs with social supports could focus on those who are less likely to achieve housing stability after leaving the assistance.

NEIGHBORHOOD DISTRESS, RACIAL SEGREGATION, AND THE LOW-INCOME HOUSING TAX CREDIT PROGRAM

Abstract ID: 481

Individual Paper Submission

MCCLURE, Kirk [University of Kansas] McClure@ku.edu, primary author
SCHWARTZ, Alex [The New School] schwartz@newschool.edu, presenting author

The Low-Income Housing Tax Credit (LIHTC) program has become the largest production program for subsidized affordable housing. The program has also been subject to accusations and litigation that it exacerbates racial segregation by locating a disproportionate amount of housing in predominantly minority, and often low-income, neighborhoods.

Prior research compares the HCV and LIHTC programs for their entry into neighborhoods in terms of poverty concentrations and racial segregation. Among the major points of comparison is the level of distress in the neighborhoods where the assisted households in the two programs locate. The comparison is now expanding to assess the extent to which the program promotes racial integration or segregation. In 2016, the U.S. Supreme Court upheld a Texas court decision finding that the geographic placement of LIHTC developments was exacerbating racial segregation. In addition, HUD now mandates that communities prepare an Affirmatively

Furthering Fair Housing plan, determining whether their rental assistance programs promote or inhibit racial integration (although the Trump Administration postponed the deadlines for submission of the plans until 2020)

The research to be presented will address these fair housing issues as well as continue the authors' efforts to identify neighborhoods by level of distress. The level of racial separation or integration will be assessed by the racial and ethnic composition of the neighborhoods. The location of LIHTC developments and other assisted housing will be examined in terms of entry into neighborhoods by level of distress and racial segregation. Among several areas of comparison will be the degree to which LIHTC developments in central cities and in suburbs are located in census tracts with low levels of distress and racial segregation.

RACE, SOCIOECONOMIC PRIVILEGE AND THE FIRST PUBLIC HOUSING RESIDENTS IN THE US

Abstract ID: 487

Individual Paper Submission

ALLEN, Ryan [University of Minnesota] allen650@umn.edu, presenting author
VAN RIPER, David [University of Minnesota] vanriper@umn.edu, co-author

Between 1934 and the time of the 1940 Census (April 1, 1940), the U.S. government built and leased over 30,000 units of public housing across 41 cities in 22 different states, Puerto Rico and the U.S. Virgin Islands (U.S. Department of the Interior, 2004). Built under the Public Works Administration (PWA) New Deal program and the fledgling U.S. Housing Authority (USHA) created by the Housing Act of 1937, this wide geographic distribution indicates an attempt by politicians and policymakers to spread this housing across much of the U.S. However, exactly who benefited from the first public housing projects and specifically how this benefit was distributed across racial groups is not very well understood.

In keeping with policy precedent and the de jure racial residential segregation of the era, with only a handful of exceptions these first public housing projects were racially segregated. As of 1940, housing authorities had designated 61 percent of the public housing projects for white households, comprising almost 70 percent of the public housing units in this era. In comparison, housing authorities offered only 33 percent of projects to black households, comprising about 27 percent of total public housing units. The balance of projects were officially racially integrated, but typically spatial segregation by race existed within the integrated project itself.

With a demand for public housing that far outstripped supply, housing authorities could carefully screen for tenants from the thousands of households that applied (Radford, 1996; Marcuse, 1986). Archival research (Bloom, 2008; Radford, 1996) and other preliminary evidence from New York City indicates that households selected to live in public housing more typically reflected a "nuclear family" household structure, earned more money, and had a firmer attachment to the labor market than the pool of households eligible to live in public housing (Allen and Van Riper, 2018). By several measures of socioeconomic status, black households selected to live in public housing in New York during this era eclipsed white households living in public housing. In particular, black householders living in public housing tended to have substantially higher educational attainment than their white counterparts did. While some scholars have noted this difference (Radford, 1996), to date no scholars have investigated how widespread and systematic the exceptional nature of black public housing residents was in early public housing developments.

To investigate this issue we use a unique methodology that compares addresses of public housing projects to enumeration district data from the 1940 Census to identify residents of public housing in the U.S. at the time of the Census. Because we use the de-identified, complete count 1940 Census, the public housing residents that we identify represent the universe of public housing residents in the U.S. as of 1940. We compare white and black public housing households to gain insight into how the socioeconomic characteristics of public housing residents varied by race across different regions of the U.S. We believe that our research results will indicate that the earliest black public housing residents had higher incomes and better educational attainment than white public housing residents, but that these differences are not related to differences between the pools of black and white households eligible to live in public housing. Rather, we expect to find that black households had to meet a higher socioeconomic threshold to live in public housing compared to white households.

UNDERSTANDING PERCEIVED AND IDEALIZED NEIGHBORHOOD LIVABILITY IN THE CONTEXT OF TRADE-OFFS BETWEEN HOUSING CHOICES AND TRANSPORTATION OPTIONS

Abstract ID: 529

Individual Paper Submission

YANG, Yizhao [University of Oregon] yizhao@uoregon.edu, presenting author

LEWIS, Rebecca [University of Oregon] rlewis9@uoregon.edu, co-author

PARKER, Robert [University of Oregon] rgp@uoregon.edu, co-author

In recent years, livability, a concept encompassing many domains of living environments across multiple spatial scales, has emerged as a frequently pursued regional vision and community goal that underpins various planning strategies aimed at expanding transportation options, promoting affordable housing, encouraging active land uses, and revitalizing urban centers (Herrman and Lewis, 2017; Harrell et al., 2014). Many scholars, practitioners, and policy-makers believe a place of greater livability supports a more active life style, a greater use of environmentally sustainable travel, and more social interactions, and thus see the convergence between urban livability and sustainability (Gough, 2015). Indeed, an interagency partnership among three Federal Agencies, US Environment Protection Agency, US Department of Transportation, and US Housing and Urban Development, labeled as "Partnership for Sustainable Communities" (PSC), actively engages with local communities to coordinate investments in and policies for equitable/affordable housing development and transportation-efficiency maximization, two major aspects defining a place's livability.

While the consensus among many planners and designers appears strong about what should be the attributes or conditions for an ideal livable community or neighborhood, the specific factors that affect a place's livability are shaped by the values/preference of its inhabitants, their perception of environmental qualities, and their unique, lived experiences in local environments. A growing body of empirical research has revealed that many livability-affecting factors are context-dependent and some of the factors are very much subjectively determined and culturally embedded (Okulicz-Kozaryn, 2013). Nevertheless, housing, transportation, and land use are the factors receiving the most and immediate attention in the planning field when it comes to create livable communities (US DOT).

This paper examines opinions about and perceptions of neighborhood livability from residents living in three communities in Oregon. Specifically, this paper aims to address how residents' perceived neighborhood livability is affected by availability of transportation options and housing choices. Data were collected via a targeted survey within three MPOs - Albany, Eugene-Springfield, and Medford – in Oregon. These MPOs represent a small, medium and large MPO within the state, exhibiting varying political and economic conditions. Information collected from the survey helps reveal respondents' assessment of various neighborhood conditions, their attention paid to livability factors during their residential location decision-making process, and their visions for ideal neighborhood environments. GIS data are used to measure the physical characteristics of a neighborhood (e.g., land use mix, housing densities, transportation services, etc). Using logistic regression analysis, this paper reveals that limitation in housing choices due to the lack of housing-type diversity and unaffordability constrains residents' neighborhood livability outcome and affects their visions of livable environments.

This paper makes contribution to the livability literature by understanding the perceived and envisioned neighborhood livability in the context of trade-offs between housing choices, transportation options, and service accessibility that housing consumers have to make in their location decision-making process. As America's (sub)urban development since the WWII has been characterized with a lack of (conscious) coordination between housing and transportation planning, it is not unreasonable to speculate that residents, especially those residing in suburbs, have to face those trade-offs frequently. Such experiences could lead people to internalize certain residential environments, such as low-density, exclusive single-dwelling neighborhoods poorly connected with other land uses, as the only feasible livable options. Such internalization may have significant implications for implementing planning strategies aimed at retrofitting existing residential landscape via densification and public transportation investment.

DISPLACEMENT AND POLITICAL VULNERABILITY

Abstract ID: 552

Individual Paper Submission

GOETZ, Edward [University of Minnesota] egoetz@umn.edu, presenting author

WILLIAMS, Rashad [University of Minnesota] rashad.williams0824@gmail.com, co-author

As American cities gentrify (Ellen and Ding 2016) the phenomenon of direct displacement, the uprooting of lower-income households as a result of public sector redevelopment or private sector investment and upgrading, is becoming widespread. Exclusionary displacement (Marcuse 1985) is also becoming more common as whole neighborhoods see housing cost increases that push them out of reach of lower-income households who might have previously moved in. In this paper we examine the displacement of 100 households forced from their homes when their landlord sold the property to new buyers looking to redevelop for a higher income market. The households resided in the Lowry Grove mobile home park located in an inner ring suburb of Minneapolis. As Sullivan (2017) notes, the loss of mobile home parks is a major means by which affordable housing is disappearing in American metropolitan areas. A majority of the residents were undocumented workers from

Central America. As such, the case consists of a convergence of several dynamics that threaten the affordable city: suburban government reluctance to provide affordable housing, the housing precarity of low-income households, the heightened vulnerability of undocumented workers in the contemporary U.S. political climate, and the pressures that current land markets place on existing unsubsidized affordable housing.

We conducted in-depth interviews with 50 residents displaced by the sale of the Lowry Grove mobile home park. More than 50% of the respondents were Spanish speaking immigrants. Our interviews covered the reactions of families to the notice of the park closure, the experience of moving, and post-relocation adjustments. Specifically, we focused on the impact of the move on their income and working life, on family structure, and on community support. As many of the respondents feel themselves in danger of deportation they reported great reluctance to engage social and government systems to obtain assistance during their relocation. Their experiences highlighted the weakness of legislation in place to ostensibly prevent displacement of mobile home residents and to assist them should displacement occur. The paper ends with planning and public policy recommendations for more supportive systems for politically vulnerable low-income populations at risk for displacement.

NOT YOUR PARENTS' SUBURB ANYMORE: THE SUBURBAN LIFESTYLES OF YOUNG ADULTS ZOE SOTIRAKOS AND MARKUS MOOS SCHOOL OF PLANNING UNIVERSITY OF WATERLOO

Abstract ID: 554

Individual Paper Submission

SOTIRAKOS, Zoe [University of Waterloo] zcsotirakos@uwaterloo.ca, presenting author

MOOS, Markus [University of Waterloo] mmoos@uwaterloo.ca, co-author

This paper engages with two critical contemporary issues in planning: The topic of changing young adult location and housing, and the changing character and form of suburbs. Given the large size of the Millennial generation (the most recent cohort of young adults), their level of impact on the housing market has the potential to be substantial. While research on Millennial housing and location is prevalent, few if any have asked specifically about young adult suburban preferences. Our research thus asks two interrelated questions: What share of young adults is living suburban lifestyles? And among suburbanites, what are the housing and transport characteristics of suburban young adults?

Traditionally, suburban lifestyles in both the United States and Canada have been associated with particular features: Owning a detached home and automobile-based lifestyles. We use the 'suburbanisms' as a way life approach to study lifestyles on a spectrum from most suburban to most urban (see Moos & Mendez, 2015). Following methods from our prior research, we operationalize suburban lifestyles based on tenure, dwelling type, and car use, creating eight categories ranging from the most urban (ownership, single-detached dwelling, automobile-based commute) to the most suburban (renting, multiple dwelling, non-automobile based commute). We conduct this analysis using nation-wide census data from Statistics Canada in 1996, 2006 and 2011 (also see Moos and Walter-Joseph, 2017).

Contrary to previous development patterns suburbs are beginning to look similar to the patterns evident in urban centers (Grant and Scott, 2011). Post-war single-detached housing areas are becoming mixed with townhouses,

apartments and detached houses on compact lots. Our analysis will allow us to identify if young adults are in fact leading the changes in development patterns in the suburbs due to their changing preferences.

Preliminary findings indicate that young adults are most highly represented in the most urban categories. A decreasing share of young adults, compared to the total population, owns a detached dwelling with an automobile-based commute. For instance, in 2011 young adults made up 15 percent of the total population owning detached dwellings and driving to work—this is down from 22 percent in 1996. An increasing share owns an attached dwelling with a non-automobile-based commute; whereas a decreasing number of young adults are renting a detached dwelling with an automobile based commute. The findings illustrate the growing embrace of urban lifestyles by young adults, and that elements of the suburban lifestyle are changing compared to previous generations.

The findings from this research show that at least in the Canadian case, planning policy that has been pushing complete communities and densification are in fact being reflected in the housing and location decisions of young adults (Brewer & Grant, 2015). The research also serves to caution contemporary research on Millennials—even though this demographic is more likely to express demand for urban ways of living, this still leaves a large share of young adults living suburban ways of life. The kinds of lifestyles associated with young adult suburbanites are, however, also changing in that young adults are residing in suburbs that are characterized by higher densities, renting, and less auto-oriented lifestyles. The research urges planning practice and research to reconsider our conceptualization of suburbs as purely, homogeneous, low-density landscapes (Moos and Mendez, 2015).

SOCIAL VULNERABILITY IN DISASTER-RELATED BUYOUTS: A CASE STUDY OF HARRIS COUNTY, TEXAS

Abstract ID: 583

Individual Paper Submission

SEONG, Kijin [Texas A&M University] urscseong@tamu.edu, presenting author

VAN ZANDT, Shannon [Texas A&M University] svanzandt@tamu.edu, co-author

Home buyout programs have been implemented for the past four decades to facilitate the post-disaster relocation of residents out of hazardous areas to minimize future disaster risk. Limited research has identified disparities in the buyout decision-making process and outcomes. Socially vulnerable populations—households who are elderly, female-headed, low-income, minority, and/or who have lower levels of education—tend to experience more negative effects from disasters and experience disproportional hardship in coping with their built environment and circumstances (Cong, Nejat et al. 2017). These factors appear to be especially important in determining relocation decisions (Bukvic, Smith et al. 2015). Existing research examines the driving factors of resident relocation decisions at the individual level (Binder, Baker et al. 2015, Cong, Nejat et al. 2017), but research examining the neighborhood-level factors on home buyouts is very limited.

The purpose of this paper is to explore the impact of social vulnerability factors at the neighborhood level on the probability of single-family home buyouts conducted between 1985 and 2016 in Harris County (Houston), Texas. We seek to improve understanding of (1) Harris County's current home buyout program for flood mitigation, (2) the socio-demographic factors of neighborhoods that affect home buyouts, and (3) the impact of social vulnerability to flood at the neighborhood level on home buyout occurrence.

The study area of this research is Harris County, Texas, where the devastating flooding events have been frequent since the city of Houston was founded in 1836. Harris County experienced 16 major flooding events crested at over 40 feet between 1836 and 1936, and it still occurs on average about every two years, including catastrophic flooding each of the past three years, in April 2015, August 2016, and August-September 2017 (Hurricane Harvey). Houston/Harris County is perhaps the largest, most diverse, and most exposed city in the United States, making it an excellent case for this research.

The authors take a comprehensive view of county-level buyout projects carried out by Harris County Flood Mitigation District (HCFCD) for homeowners living in flood-prone areas. Flood-related home buyout data was combined with ACS 5yr estimates of Census block group data, parcel data, Harris County floodplain maps, and secondary data from the municipality, to determine the relationship between flood home buyouts and socio-demographic characteristics at the block group level. Logistic regression was conducted with 3,047 geo-coded individual home buyout cases implemented in Harris County and different demographic characteristics in relation to physical characteristics of flood exposure. This paper will discuss an overview of post-disaster home buyout implementation in Harris County, findings from the statistical analysis, and policy implications and suggestions for home buyouts in practice.

This study expects to contribute to the design of buyout programs and improved outcomes by improving our understanding of what local buyout programs accomplish over the long-term, transcending the cost-effective approach. Although research on post-disaster home buyouts has dramatically increased since the early 2000s, the studies are relatively new and little research has examined the propensity for home buyouts based on neighborhood characteristics. In this respect, this study may give planners a comprehensive view of disaster-related home buyouts in the neighborhood context and an insight of hazard mitigation and community resilience.

MEANING OF “NEIGHBOR” IN THE NEIGHBORHOOD

Abstract ID: 587

Individual Paper Submission

HALEGOUA, Germaine [University of Kansas] grhalegoua@ku.edu, primary author
JOHNSON, Bonnie [University of Kansas] bojojoh@ku.edu, presenting author

Introduction

Interest-based communities have proliferated online, which has led scholars to identify the hybridization of digital and physical spaces. To compete and strengthen ties, neighborhoods have extended their presence to online spaces via web pages, social media, and neighborhood apps. Studies have claimed that opportunities and challenges exist

in this use of online spaces for neighborhoods (Johnson & Halegoua 2013; Afzalan, Sanchez, and Evans-Cowley 2017). However, the neighborhood remains a primary unit of measurement and mobilization among planners. Discussions among neighborhood residents on social media have been used as indicators to measure neighborhood “well being” (Farnham et al. 2015). Planners have long pushed for planning at the neighborhood level and, internationally, governments from the U.K. to the Netherlands are asking non-profits and neighborhood groups to take on more of the work of the “state” (Needleman & Needleman 1974; England 2008; Pollitt and Dan 2011; Painter 2012). What is missing from these discussions of neighborhood and the expectations of neighborhoods is what it means to be a “neighbor” today, particularly in the digital age. How “neighborly” are people willing to be? What can we as planners expect from neighbors? Does digital media help or hurt when it comes to being a neighbor? Planners and other policymakers need to be cognizant of how much to ask of those at the grassroots to avoid mismatches between obligations, expectations, and neighborly “ethics of care” (England 2008) and capacities.

Methods

We address the meaning of “neighbor” and “neighborhood” through 21 interviews with residents and surveys of 212 households out of 573 in the Indian Hills Neighborhood of Lawrence, Kansas. The surveys were administered in 2013 and follow-up interviews were conducted in 2014. Aside from being slightly older, the demographics of the survey respondents parallel the U.S. Census demographics for the neighborhood and Lawrence, Kansas.

We conducted approximately one hour-long interviews about communication within the neighborhood and with neighbors. We asked what makes a “good” neighborhood and neighbor; what they expect from their neighborhood and neighbors; what are the perceived benefits and drawbacks of living in close proximity to others.

Findings and Relevance

Based on the interviews, we suggest that residents regard or would like to regard the neighborhood as a service-oriented community built on informal, and mutual insurance rather than social or political models of neighborhood engagement and organization. Neighborliness does not extend to friendship or more social interactions. It does not mean political organizing unless there is a crisis. The conundrum here is how people can know when others need help or when there is a crisis when they are not friends, do not belong to a neighborhood organization, and they do not use digital media to communicate. It seems that proximity, chance encounters, and informal communication are key.

From the interviews and the surveys, we know that people in this particular neighborhood want to be able to help each other, if they know their neighbor needs help. They will give someone a ride to the store when they need it or provide a casserole if someone is sick, but they are not going to be “friends” on Facebook or see each other socially, they will only be “neighbors.”

The emphasis on observability has implications for neighborhood design, visibility, and privacy. The emphasis on helping, but not friendship, has implications for how to use digital media. The desire to organize only when there is a crisis has implications for long-term interactions between neighborhoods and policymakers. The desire for providing a little help, but not too much help, has implications for neighborhood planning and how much policymakers can expect from neighborhoods as service providers.

LOCATION EFFICIENCY AND THE PROVISION OF AFFORDABLE HOUSING: EMPIRICAL EVIDENCE FROM A NATIONAL STUDY

Abstract ID: 601

Individual Paper Submission

JAHAN, Jinat [University of Texas at Arlington] jinat.jahan@mavs.uta.edu, presenting author

HAMIDI, Shima [University of Texas, Arlington] , co-author

The U.S. Department of Housing and Urban Development's (HUD) simple percentage of income-to-housing cost measure to define housing affordability disregards other costs of living variables such as transportation (Jewkes & Delgadillo, 2010). As transportation is the second largest expenditure category for a typical American family, so consideration of housing costs only to measure affordability can be unfair to low-income families. A recent national study by Hamidi et al (2016), found that, 44% households supported by Multifamily Section 8 program spend more than 15% of their income on transportation and hence those properties are unaffordable. A follow up study in Dallas Fort Worth Metropolis also found that, 69% of major HUD assisted programs are unaffordable in terms of transportation costs (Hamidi et. al, 2018).

The Multifamily Section 8 program is only one of the HUD assisted programs that was studied at national level considering the transportation costs. But this program has been discontinued and it currently includes only the renewal of existing contracts. There is a systematic gap to nationally investigate the link between housing and transportation costs for other major housing programs such as Low-income Housing Tax Credits, Public Housing and HOME Investment Partnership among others. According to HUD (2013), about \$35 billion have been spent annually on these programs, yet there is little understanding on the effectiveness of these programs with regard to transportation costs. This research seeks to identify whether and to what extent the HUD assisted major rental housing programs are truly affordable in terms of transportation costs in all Metropolitan Areas (MSAs) in the US. We collect the disaggregated data of major rental assistance programs in 363 MSAs in the US. Then we geocode the data and measure the built environment around each property. We consider the built environmental variables that are related to travel, known as the D variables (Ewing & Cervero, 2010) such as, density, diversity, design, destination accessibility and distance to transit. Based on these variables, we calculate the transportation costs using the transportation cost models developed by Hamidi et al. (2016). Then, we divide the transportation costs by the income level of people qualified to live in these properties. The outcome determines whether the property is affordable for a typical low-income household in terms of transportation costs. We also make national comparisons of auto-oriented and transit-oriented MSAs.

This study is one of the first attempt at national scale to evaluate performance of different major housing programs by factoring in transportation costs for address level data. The recommendations of this study can help federal and state housing authorities to evaluate the affordability performance of these properties and to make more location efficient investments. Based on our findings, we propose a list of policy implications to promote transportation equity, location efficiency and combined effects of housing and transportation in planning for affordable programs.

PARTICIPATION IN NYCHA’S NEXTGENERATION PLAN: TENANT NEIGHBORHOOD OWNERSHIP IN A ‘PUBLIC’ REDEVELOPMENT PROCESS

Abstract ID: 608

Individual Paper Submission

STAHL, Valerie [Columbia University] valerie.stahl@columbia.edu, presenting author

In 2015, Mayor Bill de Blasio introduced NextGeneration NYCHA, a 10-year proposal that intends to fill the New York City Housing Authority’s (NYCHA) \$17 billion capital budget shortfall and revitalize the city’s distressed public housing through a series of predominantly privately financed initiatives. The most controversial component of the plan includes leasing ‘underutilized’ land adjacent to existing public housing to private developers, who will be responsible for constructing and managing mixed-income, mixed-use developments on NYCHA playgrounds, parking lots, and green spaces. While NYCHA officials are assuring existing residents that the plan will not result in any direct residential displacement, current tenants have already expressed skepticism towards the inevitable changes that will come with the private construction of over 3,500 market-rate apartments (NYCHA 2016). Through a multi-site qualitative case study, this dissertation project will focus on the role of public housing residents and evaluate how they conceptualize ownership of their neighborhood in the midst of a redevelopment process.

In this project, I will first ask: How do NYCHA residents use the NextGen participation process to define their sense of ownership over their public housing project, both before and during redevelopment? How does this vision differ from how policymakers are conceiving the ‘future’ neighborhood of NextGen NYCHA? And how do residents reconcile feelings of ownership with the role of the housing authority in managing their ostensibly ‘public’ neighborhood, especially as NYCHA asserts their right to change it? This project is broadly motivated by analyses of mixed-income housing initiatives that fail to comprehensively assess tenant engagement and resident resistance to the planning process in mixed-income housing redevelopments (Goetz 2016), as well as assessments of participation that seldom inquire how residents may seek alternative goals beyond influencing outcomes (Day 1997).

To chronicle the experience of residents who remain in-place, I use a single case study with two embedded units of analysis to evaluate the community planning process at 2 of 4 designated NextGen NYCHA pilot locations. I review policy and media reports, attend stakeholder meetings and planning charrettes, and conduct semi-structured resident and stakeholder interviews at the Cooper Park Houses in Williamsburg, Brooklyn and the Wyckoff Houses in Boerum Hill, Brooklyn. Using discourse analysis, this chapter will present the initial results from this research, which shows how public housing tenants are using the participation processes as a forum to define their right to their neighborhood, as a space to advocate for other housing goals, and as a platform to spotlight a history of negligence by the housing authority.

Participation in planning has long been critiqued for reducing the role of residents to mere ‘tokenism’ (ibid). However, such critiques focus on how participatory processes influence outcomes, ignoring the other ways residents use engagement for their own value frames (Buunk and van der Weide 2015). Increasingly, as the state has retreated from robust housing interventions and planners have further bureaucratized participation, savvy public housing tenants are becoming aware of their inability to change the overall course of neoliberal policies in their projects. In the case of NextGen NYCHA, tenants do not see participation as a means to actually influence the planning process or have a say in the course of the plan, but instead as a way to assert their ownership over

their changing neighborhoods. While NYCHA policymakers are still heralding the legitimacy and transparency of the plan's participatory elements, tenants are using participation to caution against secondary forms of displacement while also affirming a coherent group identity (Young 1991) prior to new residents moving to their long-neglected neighborhoods.

WHO MOVES UP? WHO MOVES OUT?: THE DETERMINANTS OF PRE- AND POST-MOVE INCOMES FOR LOW-INCOME HOUSEHOLDS IN CHICAGO

Abstract ID: 617

Individual Paper Submission

GREENLEE, Andrew [University of Illinois at Urbana-Champaign] agreen4@illinois.edu, co-author
PAN, Haozhi [University of Illinois at Urbana-Champaign] hpan8@illinois.edu, presenting author
DEAL, Brian [University of Illinois at Urbana-Champaign] deal@illinois.edu, co-author

Following the 2007 housing crisis, residential mobility rates within the United States have declined to an all-time low. When disaggregated by income, very low income and extremely low income households have also experienced declines in mobility rates; however, these rates are still disproportionately higher than the rates for households in higher income categories. Residential location choice for low-income households has been analyzed, but given the paucity of available longitudinal data, much of this work has focused on populations for which administrative data is collected such as households receiving Federal housing subsidies. Findings from studies that look at the value of mobility suggest that low-income households stand to benefit substantially from moves to more favorable sociodemographic conditions—particularly to areas with a greater share of higher-income households (Chetty, Hendren, and Katz, 2016). Yet studies that examine the overall exposure of low-income households to higher-income neighborhoods suggest that there are substantial barriers to entering and staying in these types of neighborhoods even when assisted housing subsidies are present.

In this paper, we examine the residential mobility patterns of extremely low income and very low income households, paying close attention to the characteristics that predict the mobility of these households. We focus on parsing out the relationship between household income in origin and destination locations, to interpret which low-income households are able to use residential mobility to not just “get ahead” to more favorable neighborhood conditions but also to increase prosperity and resources to support staying ahead. As a point of comparison, we examine the income levels of households that move but do not increase access to more favorable neighborhood conditions. Finally, as a point of reference for policy discussions, we examine mobility to and from public housing sites to better understand the qualities and tradeoffs of transitions to and from these neighborhoods. To accomplish this, we use a novel source of household-level longitudinal mobility data from InfoUSA to construct longitudinal portraits of household mobility over the period 2006-2014 for the Chicago metropolitan area.

Findings from descriptive analysis and our models of income differences between origin and destination communities show evidence that the sociodemographics of origin neighborhoods play a strong role in predicting the sorting of low-income households into new residential locations as well as changes in household income at destination. Neighborhood racial composition, income, and residential vacancy rates all serve as important determinants of mobility. The presence or absence of public housing also plays an important role in the sorting of both very low income and low-income households. Taken together, our findings underscore the need for a more detailed understanding of the intersection between place-based interventions and residential mobility policy—particularly for low-income households.

IMPACTS OF SHORT-TERM RENTALS ON HOUSING AFFORDABILITY IN THE SAN FRANCISCO MSA: THE DARK SIDE OF THE SHARING ECONOMY

Abstract ID: 636

Individual Paper Submission

SHARMA, Sukanya [University of Illinois at Urbana-Champaign] sukanya3@illinois.edu, presenting author
LEE, Bumsoo [University of Illinois at Urbana-Champaign] bumsoo@illinois.edu, co-author

Whereas Airbnb and its users promote its positive effects on tourism and cultural exchange, Airbnb can also create various problems to the community such as nuisance spill over to residential neighborhoods and housing market distortion (Gurran and Phibbs, 2017). The short-term rental housing options supported by the sharing economy have now become a major disruption in the housing and tourism sectors. Many rental property owners switch from a long-term rental housing market to a more profitable short-term lease/home sharing market using online platforms such as Airbnb, creating or adding to an affordable-housing crisis in many large metropolitan areas.

The proposed research will study the impacts of short-term rentals in the form of Airbnb listings on the rental affordability and the long-term rental housing stock in the San Francisco Metropolitan Statistical Area (MSA). The study aims to undertake a longitudinal as well as a cross sectional analysis. We carry out a longitudinal analysis for the City of San Francisco where Airbnb listing data is available for five years from 2013 to 2017 whereas, the cross-sectional study expands to the whole San Francisco Metropolitan Region where we were able to scrape the data only for 2017. We convert all Airbnb listings into a census tract level composite index that takes into account availability through the year, number of available bedrooms, and type of listings.

Our basic modeling strategy will be a spatial lag model in which rental housing affordability is regressed on Airbnb listings' share of the total rental housing stock and other neighborhood attributes. We will employ multiple indices to measure rental affordability, including percent burdened households, percent overburdened households, and gap between minimum wage and the wage needed to afford the fair market rent for a two-bedroom unit. Other neighborhood characteristics affecting rental affordability include location variables (e.g. distance from BART stations, costal location, and distance to the CBD), socio-economic variables (e.g. education, unemployment rates, job accessibility, etc.), and school quality.

Overall, this study will contribute to the body of literature revolving around the debate through a quantitative analysis that can guide discussion about the possible need for policies in response to the Airbnb-like businesses and the sharing economy in general.

STAYING ON BOARD: NON-PROFIT HOUSING PROVIDER BOARD CAPACITY IN A CHANGING CONTEXT

Abstract ID: 643

Individual Paper Submission

COOPER, Sarah [University of Manitoba] sarah.cooper@umanitoba.ca, presenting author

ZELL, Sarah [University of Winnipeg] s.zell@uwinnipeg.ca, co-author

MCCULLOUGH, Scott [University of Winnipeg] s.mccullough-ra@uwinnipeg.ca, co-author

For decades, non-profit social housing in Canada has been supported by volunteer boards of directors. These boards have managed many different aspects of social housing development and provision, from establishing nonprofit organizations in the 1970s, '80s and '90s, to today providing governance and planning advice to staff. Often, particularly in smaller organizations, boards have a hands-on role in building maintenance and tenant relations. As such, members of boards, who may not have any particular expertise in housing provision, have played a key role in meeting demand for low-cost housing in Canada (Skelton, 1996).

Today, the policies shaping and supporting non-profit social housing are changing. The funding agreements between the state and the provider, which have governed the operation of social housing providers for the past forty to fifty years, are expiring. Boards of directors must now navigate a new context with fewer subsidies, particularly the deep, long-term subsidies that enable providers to offer low rents and rents geared to tenants' incomes. Moreover, many housing providers find that their buildings are aging and beginning to need significant upgrades and repairs; they also may find that their reserve funds, which were capped by the agreements, are too low to sustain the housing moving forward (CHRA2014). The relationship between the state and the housing provider is now increasingly shaped by commodification and privatization of housing (Rolnik, 2013).

These challenges would be difficult for any board to navigate. While many housing providers have strong boards that are eager to take on these challenges, others do not. In Manitoba, many boards are growing older, relying on a small number of directors, and, after having supported the housing for many decades, risking burnout. The capacity and effectiveness of the board and organization are thus threatened (Renz and Herman, 2016), and complicated by a changing fiscal and regulatory context.

We explore this issue through qualitative, semi-structured interviews with actors in the social housing sector, including non-profit housing providers, in Manitoba, Canada. We ask how ready they are to deal with a post-agreement context: what are the internal and external challenges facing boards as their agreements expire? And how are boards responding to the changing context in order to continue to support the organization? This paper

analyzes the role and capacity of boards of directors in navigating the expiring operating agreements in an increasingly complex context, with fewer state supports.

As the social housing operating agreements continue to expire over the next two decades, the social housing system in Canada will undergo a significant transformation. The capacity of housing providers to continue to offer low-cost housing is crucial in meeting the still-high demand. Boards of directors play a key role in supporting the work of non-profit housing providers; without a strong board, it could be difficult for a provider to maintain its sustainability over the long term. As long as non-profit housing is an important part of the housing system, ensuring that boards have the capacity to address new challenges will be integral to the long-term healthy functioning of the housing system.

HISTORIC (DISTRICT) TRENDS IN URBAN AMERICA: A CLUSTER ANALYSIS OF NEIGHBORHOOD CHANGE IN LARGE AMERICAN CITIES, 1970-2010.

Abstract ID: 652

Individual Paper Submission

STANEK, David [University of Pennsylvania] dstanek@upenn.edu, presenting author

The historic district is a ubiquitous component of the American urban landscape. More than 2,000 cities and towns have created historic districts in neighborhoods of every demographic type within the full-range of market value. While they serve the same service-providing function and involve the same social, economic, and political complexity of any non-designated neighborhood, they do have one commonality among them: their publicly acknowledge and protected historical significance. The designation and regulation of a historic district to preserve it for future generations implicitly acknowledges that the cultural values associated with the present physical integrity of the district are inherently more beneficial to the public than any future economic value associated with modifications to its built fabric that deviates from its current character. Although every neighborhood has associated cultural values, this act of districting, and the associated regulations that follow, alters the decision-making of property owners and potential investors within the district and, as a result, affects neighborhood change in ways that differ from non-designated neighborhoods. The problem that both planners and preservationists face is the lack of research on the nature of neighborhood change in historic districts. With decennial census data from 1970 through 2010 derived from the Longitudinal Tract Database (LTDB), this study will classify and analyze neighborhood change in an estimated 400 residential historic districts in 57 cities throughout the United States. It will use a K-means hierarchical cluster analysis to classify neighborhoods by their socio-economic profile to analyze their longitudinal change. It is important to understand the differences in neighborhood change because preservation practice cannot evolve beyond its current curatorial, site-centered focus to a more urbanistic, outward looking approach that seeks “to connect historic preservation to the work of other fields and disciplines, such as planning, design, and education, in pursuit of solutions that address broader social goals” (Mason, 2006, p. 25) if it does not fully understand how preservation interventions interact with the dynamics of neighborhood. In evolving to a more urbanistic approach, preservationists can expand their practice beyond the simple binary to preserve or not preserve and more fully integrate a preservation ethic into the planning, management, and production of cities in the future.

REBUILDING COMMUNITY DEVELOPMENT PRACTICE IN TROUBLED TIMES.

Abstract ID: 653

Individual Paper Submission

WAGNER AICP, Jacob [University of Missouri-Kansas City] wagnerjaco@umkc.edu, presenting author

Community development practice in the United States is in crisis. Neoliberal de-regulation, federal and state cutbacks, and a lack of sustained investment in community development systems at the municipal and metropolitan levels has deeply undermined the old model of community development practice. Decades of incomplete policy initiatives have left many planners with a legacy of distrust and neighborhoods have been left to fend for themselves.

In this context of turbulent technological, political and social change, planners working with communities of concern need new models for renewing community practice. Community-oriented planners need new methods to build trust and sustain mutual learning and respect. In an era of disorganization and dehumanization, local planners need innovative strategies to celebrate local and regional diversity, and to build community awareness through critical social learning and collaborative problem-solving.

How does one create a sense of belonging at a time when people feel alienated – from each other and from the work of community building?

At a time when optimism about the future is low, re-invigorating local awareness of neighborhood histories and community organizing provides a critical praxis for sustaining and renewing the underlying values and vision for transformative community building. This research addresses the challenge of rebuilding community development knowledge and neighborhood planning practice with a new method: collaborative production of local historical knowledge to visualize and celebrate shared collective memory.

Scanning the field of urban community planning and development initiatives, it is clear that cities across North America are struggling to reframe urban historical narratives and to rebuild community development practice through new strategies. This paper documents and reports an emerging method for co-creating shared histories in troubled times. This approach provides planners with a community building opportunity: making meaningful and shared histories of place as a basis for critical planning praxis.

This collaborative planning methodology recognizes the importance of co-creating local histories of resistance and community organization during a time of uncertainty and confusion. The paper describes a contemporary approach to building consensus through shared histories and collective memory. Co-creation is a methodology in which planning scholars, community organization staff, youth and students, and community stakeholders generate a new sense of shared, local knowledge. The purpose of the method is to rebuild local knowledge and trust as an underlying necessity for local efforts to strengthen community and renew community planning practice.

HOUSEHOLDS WITH RENTAL ASSISTANCE PROGRAMS AND THEIR ACCESSIBILITY TO TRANSPORTATION AND EMPLOYMENT

Abstract ID: 675

Individual Paper Submission

PARK, Han [Rice University] john.park@rice.edu, presenting author

CHOI, Kwangyul [University of Calgary] kwangyul.choi1@ucalgary.ca, co-author

Low-income families spend a big portion of their income on housing-related expenses. The primary locations of low-income families are in neighborhoods where many low-cost rental units are available generally in a central city due to the availability of low-cost rental properties in dilapidated areas and the expectation of using public transportation given their mobility limitations. Little research has done to evaluate if such households with rental assistance programs benefit transportation infrastructure in a central city. Low-income families living in a neighborhood with affluent transportation services can decrease transportation expenses by alleviating mobility challenges and result in increasing the accessibility to potential economic opportunity, including jobs.

This research examines the level of accessibility to transportation and job resources specific to tenants residing in rental assistance program units in the city of Houston, Texas. It evaluates whether the local transit authority reduces mobility barriers to enable these renters to access employment hubs where low-income jobs are clustered. Specifically, this research compares the residential outcomes of the two major rental assistance programs - Housing Choice Voucher (HCV) as a tenant-based program and Low-Income Housing Tax Credits (LIHTC) as a project-based program - and their transportation and employment accessibility. Firstly, this research evaluates how these tenants are served by the local transit authority and the state transportation department with the following transportation services such as Light Rail Transit (LRT), bus, park-ride stops, and transit centers, and with built-environment quantified scores, including walkscores and bikescores as the proxy for pedestrian- and biker-friendly environment. Furthermore, this research assesses spatial distributions of the assistance housing program tenants and the job hubs where most low-income employees are hired. The primary datasets are acquired from the Houston Housing Authority, the U.S. Department of Housing and Urban Development (HUD), the City of Houston, the Metropolitan Transit Authority of Harris County, and the U.S. Census Bureau.

Affordable housing programs significantly help low-income households without enough income sources to reside in urban cores that typically have higher accessibility to transit services. However, the evaluation of the accessibility to desired destinations, particularly employment centers, for this population is necessary. The findings will provide policy makers, housing analysts, and urban planners with a better understanding of transportation-related challenges that low-income families face and issues on the tenants' work-trips.

One of the notable features in the demographic changes of developed countries is the rapid growth of aging population and one-person households (Yeung and Cheung, 2015). In Korea, the proportions of one-person households has risen from 15.5% in 2000 and 27.2% in 2015. The growth of one-person household is not just a global demographic change trend, but has a significant influence on the housing market. As an alternative to the increasing residential demand of one-person households, recently, a shared house is getting more attention. Distinguishable features of a shared house from other types of residence is not only to share space among residents, but also to social and emotional sharing among residents through interactions among people with similar hobbies and lifestyles (Oh and Choi, 2014). In this study, we hypothesized that the living experience in the share house may affect the sense of community where the shared house is located, as well as the community among the members in the household. To examine associations between the shared house living and formation of sense of community, our study focused on two research questions.

(1) What are the significant determinants of a shared house choice?

(2) How does the living experience of the shared house affect the sense of community?

For this purpose, we conducted stratified random sampling and selected 750 one-person households residing in Seoul. Of these, 250 residents lived in the shared houses. The survey questionnaire included socioeconomic characteristics of residents, residential satisfactions, sense of community, attitude toward sharing residential space and duration of residence. The “attitude toward sharing residential space” was composed of 4 items, and component score was calculated using principal component analysis. For identifying characteristics of sense of community, we conducted factor analysis and defined community attachment, interaction with residents and sense of belonging. To analyze the influence of the shared house residency on the sense of community, we classified residents into four residential groups based on residential preference and actual residential type (Schwanen and Mokhtarian, 2005) and examined the effect of dissonance between residential preference and actual residential type on three sense of community factors using OLS.

The analysis results showed that female with lower education level and younger age were more likely to choose the shared house. The residents of the shared house tended to have shorter period of residency, shorter commuting time, and positive attitude toward sharing residential spaces. With regard to the sense of community, the shared house consonant group (those who prefer the shared house and live in the shared house) had higher community attachment and sense of belonging than the elsewhere dissonant group (those who prefer the shared house but live elsewhere). Regardless of their actual residential type choice, the groups with lower preference for the shared house showed lower attachment, sense of belonging, and interaction with residents than the groups with higher preference for the shared house.

The results implies that the groups with positive attitude toward sharing residential space were likely to have a higher sense of community to which they belong. In particular, the living experience in the shared house reinforced the sense of community. Ironically the mean period of residency of a shared house is much shorter than

that of other types of housing because of unique characteristics of residence contract. Considering that the living experience in the shared house is significantly associated with the sense of community, it is necessary to supply a share house that can stay stable for a long time.

SPATIAL PATTERNS IN COSTS OF MORTGAGE CAPITAL DURING THE CRISIS IN OHIO

Abstract ID: 691

Individual Paper Submission

NAGASE, Daisuke [The Ohio State University] nagadai@hotmail.com, presenting author

Equal access to lower-risk mortgages plays an important role for resurgence from the neighborhood decline by foreclosures during and after the subprime crisis. Nevertheless, inequalities in mortgage lending by neighborhood racial composition have been persistent in the U.S. housing market, lasting nearly a century since 1930s. Predominantly minority neighborhoods have been disadvantaged in mortgage lending. Thus, this study investigates spatial patterns in costs of residential mortgage capital by neighborhood race during and after the mortgage crisis.

Beginning with redlining in the early 20th century, disparities in mortgage lending by race and neighborhood racial composition have been evident in the lack of inflows of residential mortgages for predominantly minority neighborhoods, compared to predominantly white neighborhoods (Immergluck, 2009). During the subprime boom since the late 1990s, lenders engaged in reverse redlining, thereby steering predominantly minority neighborhoods to high-cost subprime mortgages. Accordingly, neighborhoods with high concentration of subprime loans, particularly predominantly minority neighborhoods, suffered from high rates of foreclosures causing neighborhood decline (Immergluck, 2009). In the wake of the foreclosure crisis, major conventional mortgage lenders have tightened their underwriting practices (Immergluck, 2011). Limited studies indicate disparities in mortgage lending patterns by neighborhood racial composition during the mortgage crisis period (Richardson, Mitchell, & West, 2016). Additionally, the proportion of higher-cost residential mortgages has gradually increased since 2010 and has been about twice as high among minority borrowers as compared to white borrowers even during the crisis period (Board of Governors of the Federal Reserve System, 2015).

Given these trends, this study aims to examine spatial mortgage lending patterns during and after the foreclosure crisis by asking: Do the cost of residential mortgages differ by neighborhood racial composition during and after the crisis? To address the question, this study investigates annual percentage rate (APR) spreads, which are differences between original interest rates and market rates at the mortgage origination, in the five metropolitan statistical areas (MSAs) in Ohio, including the Cleveland, Cincinnati, Columbus, Dayton, and Toledo MSA, during the crisis period, from 2008 to 2011, and the recovery period, from 2012 to 2015.

The study utilizes cumulative data from the American Community Survey, Home Mortgage Disclosure Act, and data on mortgage lending from CoreLogic®. This study begins with a description of APR spreads by neighborhood racial composition, utilizing Geographic Information System (GIS). The analysis is followed by a multivariate analysis where ordinary least squares (OLS) regression is utilized to evaluate the association between the APR spread and neighborhood racial composition, controlling for loan-level information such as credit scores,

loan-to-values, and debt-to-income at mortgage origination as well as various neighborhood attributes such as neighborhood income.

Housing for the urban poor is a worldwide challenge for achieving social equity and inclusive urban development. The existing literature on affordable housing policy have primarily focused on documenting the evolution and politics of affordable housing policy design, or assessing the impacts of affordable housing programs on recipient families' well-beings, neighborhood transformation, or the housing market. Relatively few studies have systematically investigated – from a policy implementation perspective – why some cities perform better than others in addressing the housing needs of low-income families.

In China, the past decade has witnessed a revived government commitment to provide subsidized housing for low and middle-income urban households, in response to the deteriorating affordability of the booming urban housing markets. In the Twelfth Five-Year Plan, the central government set out an ambitious target of building 36 million units of various types of affordable housing during the period of 2011-2015. This national target was allocated to each province and further down to each prefectural municipality as a political mandate for local leaders. Yet despite the increased amount of fiscal transfer by the central government to support affordable housing construction, implementation at the local level remained contentious and sluggish in some localities.

In this paper, we investigate how local (city) governments have complied with the top-down mandate of affordable housing construction in the Twelfth FYP. We compiled a city-level panel dataset of the annual number of units of affordable housing construction in each city during 2011-2015 through comprehensive review of local government documents. We combined this database with city-level statistics of economic and social development, housing market status, and local public finance, as well as variables capturing local leaders' political incentives, which are derived through content analysis of local leaders' political resumes. Preliminary analysis using fixed-effect models reveals a spatial mismatch pattern that cities with more fiscal capacity and worse housing affordability do not necessarily construct more affordable housing. Preliminary analysis also finds a curvilinear relationship with per capita GDP, indicating that, while poorest cities tend to perform worse, wealthiest cities also tend to have less commitment in affordable housing construction.

We believe that this empirical research contributes to the scholarly understanding of the politics of affordable housing policy in the international literature, as well as enlightens future policy making toward better implementation and performance of affordable housing policy in China.

HOW DOES NEIGHBORHOOD ACTIVITIES INFLUENCE RESIDENTIAL SATISFACTION? EVIDENCE FROM SHANGHAI

Abstract ID: 733

Individual Paper Submission

TA, Na [East China Normal University] nta@geo.ecnu.edu.cn, presenting author

Residential satisfaction has drawn much more attention in geography, planning, sociology, and psychology with consideration of quality of life. Existing literature have examined neighborhood environment, housing conditions and personal socioeconomic attributes on residential satisfaction. In recent years, prior studies have concerned about the relationship between activity-travel behavior and residential satisfaction. Residents may spend different time and conduct different types of activities in neighborhoods. Some scholars suggest that usage of residential environment may have significant impact on residents' satisfaction with neighborhoods by enhancing their community involvement and social network. However, the effect of conducting activities in neighborhoods on residential satisfaction is still unclear. This study tries to fill this gap by examining the contribution of activity pattern in neighborhoods to residential satisfaction.

We apply a subjective evaluation framework of satisfaction, including both overall residential satisfaction and subjective evaluation to residential environment. The activity pattern is defined in terms of number and types of daily neighborhood activities conducted. Activities include shopping, leisure, social behavior, walking around, physical activities, eating out, and other types of non-work activities.

The study is based on an activity-travel diary data collected in Shanghai in 2017. Data were collected from March to July 2017. Different types of neighborhoods were sampled in ten suburban districts, including traditional housing, public housing, and commercial housing. Recruited participants were invited to answer the questionnaire through a face-to-face interview.

The questionnaire includes an activity-travel diary, which requests that participants record all activities conducted within the past 48 hours. Neighborhood activities are defined as activities conducted within 1 km distance from home. These activities are classified into four categories, including shopping, leisure/social activities, eating out, and other. Residential satisfaction data are collected by asking participants to answer five statement about residential environment by rating them using a five-point scale from 1 (not satisfied) to 5 (totally satisfied). The survey also includes personal and household socioeconomic information and social network.

The hypothesis is that conducting more activities in neighborhoods has positive impact on residential satisfaction, but different types of activities have various effects. Descriptive analysis is used to analyze the relationship between activity pattern and residential satisfaction. Then multi-level regression model is used to study the influential factors of residential satisfaction. Besides neighborhood activities, socioeconomic attribute, housing conditions, built environment in neighborhoods and social environment in neighborhoods are controlled.

For policy implications, the findings of this study will contribute to housing policies and community planning, by suggesting that policies aimed at promoting residential satisfaction should emphasize more on community facilities to increase daily neighborhoods activities.

NEGOTIATING THE COMPACT CITY: HOW ARE VOLUNTARY PLANNING AGREEMENTS SHAPING INFRASTRUCTURE OUTCOMES FOR HIGH DENSITY INFILL DEVELOPMENTS IN SYDNEY, AUSTRALIA?

Abstract ID: 747

Individual Paper Submission

CROMMELIN, Laura [University of New South Wales] laura.crommelin@unsw.edu.au, presenting author

The compact city planning model – which prioritises urban consolidation and densification within existing urban areas – has become planning orthodoxy around the world over the past two decades, including in major Australian cities (Bunker et al 2017). Key to the success of this model is ensuring newly developed and densified urban areas provide good access to services and jobs through effective infrastructure provision. In Australian cities, essential public infrastructure like schools and public transport is generally planned and funded at the metropolitan level by state government, while responsibility for other neighbourhood public space and services falls to local councils. In the state of New South Wales, where Sydney is located, councils have two main contribution mechanisms for funding public infrastructure associated with new development: developer contributions and levies, and Voluntary Planning Agreements (VPAs). While both mechanisms are complex and controversial, VPAs raise particularly significant questions about whether they produce infrastructure equitably and efficiently. The extent of this controversy is reflected in the NSW government's recent decision to review the VPA system, to better regulate how these increasingly popular agreements are developed and reported.

VPAs allow developers to negotiate with councils to provide public facilities or services, in connection with a decision to allow density increases in an associated development. VPAs have been used to provide a range of important infrastructure, including public transport links, parks and libraries, but the process raises multiple concerns. VPAs are negotiated on an ad hoc basis, often relatively late in the planning process, creating uncertainty for communities already living in redevelopment areas. The contracts can be highly complex, and the negotiation process often lacks transparency. Outcomes are also dependent on the negotiating capacity and resources of the local council. As a result, this process can produce public infrastructure that doesn't reflect the local community's preferences or best interests. Developers also use infrastructure provided under VPAs as a marketing tool, and are thus incentivised to fund projects that are a selling point for market-rate housing, rather than infrastructure that serves lower-income and vulnerable residents. How likely is a developer to build a community centre or a public health clinic under a VPA, for example, rather than a park or a sports facility?

Planning scholars have long been interested in the impact of related planning agreements and planning obligations around the world, highlighting issues with equity and efficiency, as well as procedural challenges (Healey et al. 1995; Crook et al 2015). Yet despite this ongoing academic debate, mechanisms like VPAs remain popular for funding infrastructure provision. To date, however, there has been limited research documenting and critically examining the role of VPAs in providing infrastructure in connection with high-density infill housing development in Sydney (Gurran et al 2009; Ruming 2012). This paper addresses this gap, drawing on the results of a multi-year mixed methods research project assessing the outcomes of compact city planning in Sydney, including a policy review, census data analysis, and 32 key stakeholder interviews. The paper also provides a detailed case study of VPA-funded infrastructure in Wentworth Point, a major high-density infill redevelopment area in Sydney's inner west, now home to over 7000 residents. Through this case study, the paper illustrates some key concerns raised by this controversial approach to infrastructure provision, and examines whether the government's proposed amendments to the VPA system will adequately address these concerns. In doing so, the paper contributes to the ongoing academic debate over planning obligations, and assesses the implications of planning agreements for the equity and inclusiveness of the success of the compact city planning model.

THE IMPACT OF WELFARE FACILITIES ON HAPPINESS OF THE ELDERLY: EVIDENCE FROM SEOUL, KOREA

Abstract ID: 750

Individual Paper Submission

KIM, Danya [Korea Culture and Tourism Institute] aesthetic82@gmail.com, primary author
JIN, Jangik [Kyung Hee University] jjin.realestate@khu.ac.kr, presenting author

Our world is moving toward a more aged society. One concern about this situation is that a smaller workforce will struggle to support a growing proportion of the old. Another one is that older people are expected to be isolated from our society because a large proportion of them live alone. With a perspective of social welfare, the latter issue is huge for policy-makers. Scholars have pointed out that people who live alone are more likely to be poor (Golant, 2008). And if their aloneness time is longer, poverty rates are likely to increase. As a result, many poor elderly people may experience a poor quality of life. And they also face the risk of having a lower standard of life as compared to other higher income groups.

Planners and urban scholars have recently argued that provision of public space is an effective way to improve a quality of life of poor elderly people (Cloutier and Pfeiffer, 2015). For example, public parks, recreational places, shopping opportunities, and local public infrastructure can contribute to greater personal happiness, especially for poor elderly people. Particularly, welfare facilities are important places for seniors who live in an inner-city neighborhood. In general, these facilities provide a room, meals, recreational activities, protective supervision, and some assistance with daily living. Therefore, these facilities can directly contribute to increasing a quality of life of seniors in an urban area (McCoy and Conley, 1990). Moreover, elderly welfare facilities enhance social interaction for older adults who might be otherwise isolated from society. Especially for low-income seniors who

live alone, welfare facilities can offer opportunities for socializing with others. Thus, spending time at these facilities can have a positive influence on their mental health and overall subjective well-being.

With this perspective, we explore how elderly welfare facilities influence seniors' subjective well-being, focusing on the city of Seoul, Korea through the 2005~2015 Seoul Survey data. Using fixed-effects panel models with instrumental variables, we estimate the effects of the number of local welfare facilities on elderly subjective well-being. Our results show that elderly welfare facilities have a positive effect on elderly subjective well-being after controlling for endogeneity, but these facilities are much more important for more aged elderly and lower income elderly.

Our results suggest important policy implications for improving elderly subjective well-being. Specifically, findings suggest that providing more elderly welfare facilities would improve individual elderly subjective well-being at the local level. Although the effects of neighborhood-level factors such as welfare facilities are small, they are a significant part of elderly subjective well-being. Therefore, public policy for improving local welfare facilities is one of the important elements in making the elderly happier for the rest of their lives. This can be achieved through community planning for local elderly residents.

MUCH “ADU” ABOUT A LOT: HOW SOCIAL RELATIONS INFLUENCE THE AFFORDABILITY OF ACCESSORY DWELLING UNITS IN EDMONTON, ALBERTA, CANADA

Abstract ID: 754

Individual Paper Submission

SALVADOR, Ashley [The University of Waterloo] aasalvador@uwaterloo.ca, presenting author

Over the past ten years, municipalities across North America have begun to promote Detached Accessory Dwelling Units (DADUs) as a form of affordable housing, a way to reduce sprawl and intensify existing neighborhoods, and as a form of housing that suits diverse needs across the lifespan (Chapple et al., 2011; Nichols & Adams, 2013; Pfeiffer, 2014; Wegmann & Chapple, 2014). As such, a number of cities have begun to relax zoning restrictions to allow DADUs on residential lots. In simplified terms, DADUs are stand-alone rental homes in residential backyards, subordinate to the principle dwelling. They are an alternative to large-scale developments, and represent an incrementalist approach to infill development (Wegmann & Chapple, 2014; Pfeiffer, 2014). They go by a variety of names including: Laneway Homes, Granny Flats, Carriage Homes, Secondary Suites, Garden Suites, or Backyard Cottages. This research examines DADUs in Edmonton, Alberta, Canada, where they are referred to as Garden Suites. Edmonton was chosen for this study because of its recently relaxed zoning restrictions which allow Garden Suites on almost all residential lots, and its dispersed urban form. It is also a city of interest because of the exponential growth Garden Suites have experienced over the past ten years. This research looks at Garden Suites from an affordable housing perspective, and establishes the first comprehensive dataset on DADUs in Canada.

The main question attached to this research asks whether or not DADUs are functioning as a form of affordable housing. Focus is placed on a concept called 'voluntary affordability,' whereby owners of the Garden Suites willingly charge low to ultra-low rent (Brown & Palmeri, 2014). Data has also been gathered on suite use, occupancy, construction, and demographics. For this research, all Garden Suite owners in Edmonton were contacted and asked to participate in a survey about their suite. A 64% response rate was achieved. In total, 36%

of suites were rented to family members at an average rent of \$504, 52% were rented to people the owners did not know at an average rent of \$1,154, and 12% were rented to friends at an average rent of \$1,225. Looking at suites that were rented at zero- and very-low-rent it was found that 25% of Edmonton's Garden Suites are <\$700/month, which are considered affordable rents by many definitions. 89% of the occupants of these free-or-clearly-below-market rentals are family members of the owner, thus demonstrating the role social relationships play in facilitating voluntary affordability. When looking at who is building Garden Suites, 72% of respondents have a household income greater than \$100,000, suggesting that the people most likely to benefit from the voluntary affordability associated with Garden Suites are family members of higher income individuals. If rented to people who the owners did not know, on average, occupants were charged slightly below market rate. With this in mind, Garden Suites should not be viewed as the universal remedy to North America's affordable housing crisis, but as one important piece of the affordable housing puzzle. The homeowner-developers behind DADUs are distinct from typical landlords, and in many cases are choosing to provide affordable housing for family members, be it their adult children or aging parents, at the expense of generating a greater profit. These findings are consistent with those of a similar study conducted on Portland's accessory dwelling unit stock (Brown & Palmeri, 2014). Policy changes that make DADUs more accessible and affordable for middle-income citizens to build may enable greater numbers of people to reap the benefits associated with DADUs. Similarly, revising regulations around height, size, parking requirements, occupant status, and use-class may aid in increasing the uptake of DADUs.

GENTRIFICATION IN DETROIT: CLASS TRANSFORMATION IN A RACIALLY UNJUST CITY

Abstract ID: 764

Individual Paper Submission

DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, presenting author

For decades, Detroit represented a metonym for urban failure. The statistics largely backed this up; more than a million people left Detroit between 1950 and 2010 and today there are around 80,000 abandoned buildings and one third of the land is empty. For Detroiters who remained – the majority of whom are African Americans – 40% live below the poverty line and around a quarter have no car (Galster, 2012). These statistics, and the images of ruined and abandoned buildings largely shaped this depiction of Detroit as a failed city (Doucet, 2017, p. 14-21).

More recently, however, the image of Detroit has shifted to one of renewal, and renaissance. Media reports celebrating a renewed energy and vibrancy have come to eclipse media stories of urban failure (Doucet, 2017, p. 341-346). Richard Florida (2012) even celebrated this renaissance in an online series entitled 'Detroit Rising.'

Gentrification is driving Detroit's renaissance itself, and the changing its image. But gentrification is confined to a small area called 'The 7.2' – which encompasses 7.2 square miles of the Greater Downtown. It represents around 5% of the city's area and inhabitants. Within it, new restaurants, and amenities are opening up, long-abandoned

buildings are being turned into lofts and there is even a new streetcar line. While celebrated in the media and many planning and policy circles, many academic studies have examined the ways in which this revival contributes to growing sociospatial and racial inequality (see Doucet and Smit, 2016; Kreichauf, 2017). This paper builds on these critical studies to examine how gentrification – both as a concept and as a lived experience – is interpreted by Detroiters?

This paper examines the multiple and conflicting interpretations of gentrification, how they are tied up with race and reflects on what these conflicts mean for planners and researchers who are concerned with issues of social justice. For planners, it is important to understand both the conflicts inherent to gentrification, as well as a detailed account of grassroots struggles which seek to provide a more socially-just alternative. The paper uses both secondary sources to analyze how the image of Detroit has shifted towards that of an emerging gentrified city, as well as interviews with twenty key visionaries and practitioners from Detroit, who offer differing insights into the impact and meaning of gentrification.

In Detroit, conflicts surrounding gentrification coalesce around race as well as class. The 7.2 is becoming not only gentrified, but whiter as well. For many whites, gentrification in Detroit is seen as necessity for the future of the city. The landscapes of gentrification play a role in this interpretation: even in The 7.2, abandoned buildings still exist, and can be found beside renovated houses and new-build developments. This leads to an interpretation that there is enough space for everyone. For city boosters, gentrification represents the salvation for Detroit.

For the city's African American population, particularly its well-established and visionary activist communities, gentrification is a threat, even if it does not take on the same physical forms of other cities. Gentrification is seen as a takeover of their city and even abandoned lots are contentious sites of importance to the community, particularly as spaces of urban agriculture.

This paper concludes by examining how David Harvey's concept of the 'right to the city' is evident amongst the city's poor, African American population who counter gentrification by engaging in visionary and revolutionary practices which rethink concepts of food security, land tenure, access to water, the meaning of community and education. However, these practices are under threat by the very gentrification that is driving the new, comeback city image of Detroit.

AFFIRMATIVELY FURTHERING FAIR HOUSING AT THE LOCAL LEVEL: A CRITICAL DISCOURSE ANALYSIS OF PRACTICES IN LOUISVILLE, KENTUCKY.

Abstract ID: 779

Individual Paper Submission

SIZEMORE, Steve [University of Louisville] steven.sizemore@louisville.edu, presenting author

This qualitative research project is an immersion into the beliefs, ideas, meanings, values, and feelings of actors engaged in shaping local housing policies. The paper examines how discourse constitutes and shapes the knowledge of policy actors engaged in fair housing policies and practices in Louisville, Kentucky. I argue that policy discourse is the site where social problems become framed, bounded, and transformed into action. Therefore, if the objective of the Fair Housing Act's mandate for HUD and its recipients is to operate programs in a manner which is 'affirmatively furthering fair housing' (AFFH), it is essential to understand "how policy happens." The analytical framework for this research applies a 'critical lens' by bringing Critical Discourse Analysis (CDA) and Interpretive Policy Analysis (IPA) together to study how meaning within housing policy practices is produced, reproduced, and transformed through language and discourse between policy actors. The mixed-methods research design includes semi-structured interviews with key policy actors to verify and establish context and textual analysis of key housing policy documents and related local news stories with a fair housing element since 2003 in Louisville. Preliminary findings of the research demonstrate the roles that power, ideology, and veiled assumptions play in directing local implementation of the Fair Housing Act's objectives, especially the AFFH mandate. Through a discourse analysis, the paper aims to fill a gap in the literature regarding the ways that assumed meanings and the actions of planners and housing policy actors have contributed to and perpetuated power struggles and a lack of progress on matters of housing justice.

CATCH-ALL GENTRIFICATION: OVERSIMPLIFIED MEDIA INTERPRETATIONS THAT MYSTIFY AND FAIL TO CAPTURE THE PROCESS

Abstract ID: 785

Individual Paper Submission

TOLFO, Giuseppe [University of Waterloo] pgstolfo@uwaterloo.ca, presenting author
DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, co-author

It is one of the most significant forces shaping our cities. It is also the most politically loaded word in urban studies. Ever since Ruth Glass first coined 'gentrification' over 50 years ago, it has become not only a major research area across academic disciplines, but a point of conflict in urban policy, civic debates, and the media. To many, it represents the inner-city savior: emancipation, renewal, and authenticity; to others, it represents unaffordability, displacement, and contributes to a loss of community character and continuity (McLean & Rahder, 2014).

Many academic articles provide thorough overviews of contemporary debates and research frontiers (see Doucet, 2014). What is missing, however, is an understanding of the term's use in mainstream media discourse. Though 'gentrification' appears regularly in headlines and articles of world-city newspapers, little empirical research has examined how it is discussed by the media (see Hochstenbach, 2017). This research will address this gap.

This paper surveys interpretations of 'gentrification' in Canadian print media, tracking the frequency of the term's use, and its various definitions. It will explore the ways in which media portrayals of gentrification temporally reflect academic scholarship, as well as wider neighborhood transformations in Canadian cities. Its purpose is to analyze the media's portrayal of the process and how mainstream understandings have evolved and shifted over

time. While conducting the survey, articles were coded based on subject matter: renewal, displacement, affordability, etc. The Globe and Mail – the Canadian newspaper that first mentioned ‘gentrification,’ that references it most frequently, and maintains the widest circulation – was used as survey sample. This information was then analyzed for trends and compared with contemporary scholarship.

‘Gentrification’s’ first Canadian media appearance was in 1980. Broadly speaking, its visibility has since followed the ebbs and flows of neighborhood change. The term’s use prospered during the 1980s, reflecting a particularly active phase of gentrification across North American cities (see Hackworth and Smith, 2001). Depictions at this point-in-time focused on negative consequences, such as displacement and homelessness. The early 1990s saw both a lull in the spread of gentrification and a decrease in its media attention. Since 2000, its notoriety in the media has steadily increased: it maintains negative connotations but is also used extensively as a synonym for middle-class sensibilities, aligning with wider trends in academia (Smith, 1996). Recently, in the context of growing central-city housing unaffordability, gentrification has taken on a darker tone: it paints the precarious middle-class as victims of a new process, citing foreign homeownership and income polarization as causes.

The media is the conduit of information for most Canadian citizens who interpret that which is made available, exert political pressures, and guide potential policy solutions. Over the course of its mainstream use, the term’s definition has appropriated new definitional elements, often aligning with middle-class interests and sensibilities. These oversimplified and contextual definitions may have a profound effect on policy directions and fail to attack the structural causes of gentrification. This case is made clear by contemporary taxes on foreign ownership, used unsuccessfully to promote increased affordability

Understanding how gentrification is portrayed in the media is important for several reasons. Planners should be aware of how the public understands this complex urban phenomenon: how issues may be simplified, and meanings lost. As a proxy for public understanding, this research highlights the relationship between contemporary understandings of ‘gentrification,’ academic debates, and the policy environment. It also builds a stronger link between academic research and media representations – helping to identify how they interact, influence each other, and influence the wider policy framework.

NEIGHBORHOOD DECLINE AND REVITALIZATION IN THE HIGH-DENSITY PUBLIC RESIDENTIAL ENVIRONMENT IN SINGAPORE

Abstract ID: 787

Individual Paper Submission

ORLENKO, Irina [NUS] orlenkoirina@gmail.com, presenting author
FU, Yuming [NUS] yuming.fu@nus.edu.sg, co-author

While the existing literature suggest that economically and racially mixed neighborhoods are unstable and prone to segregation, creating stable liveable high-density communities remains one of the most important challenges

facing many urbanizing cities in Asia. Theoretical work, including seminal work of Tiebout (1956), Alonso (1964) and Schelling (1971), attributes the decline to individual preferences over neighborhood racial and income composition. While the empirical evidence based on the cross-sectional census data suggests that American cities are well mixed economically (Massey and Eggers, 1990), the evidence on the neighborhoods supports the theory on instability of income mixing (Krupka, 2008). The contemporary planning theories and approaches has been increasingly emphasizing the quality of residential environment as a cause of anti-social behavior and neighborhood decline.

In Singapore's settings, where more than 80 per cent of population lives in high-rise high-density public residential environment, a traditional neighborhood decline would be hard to observe. The neighborhoods are socially and economically mixed: the flats are planned, built and allocated by the government, the access to housing depends on marital status, age, income and race creating little variation among neighborhoods in the same town, and the balance of ethnic groups is controlled by housing policy at both, neighborhood and block levels. Moreover, the living environment is standard across neighborhoods within the same town, managed by Town Councils and upgraded through renewal programs. However, understanding the complex and multidimensional underlying forces that contribute to neighborhood decline is critical for efficient public housing policies and management.

In this paper, we use a novel set urban data to define and measure the link between the quality of high-density socially-mixed neighborhoods and social behavior, and investigate what qualities make neighborhoods sustainable in the long run or unstable and tending to decline. Every Singapore's resident can alert the authorities about any issues related to the living conditions through various apps and media channels under Town Council feedback system, from fixing a malfunctioning lift to resolving private nuisances with neighbors. The data produced by these requests often provides more insightful, contemporaneous and instrumental information on residential preferences to neighborhood quality than official government statistics collected by surveys. This data reflects – albeit imperfectly – not only residential preferences to the physical quality of living environments, but also to the social values that each community defines and measures for itself. As the efficacy of housing policies and management depends critically on the complex and multidimensional underlying forces that contribute to neighborhood decline, the question here is not only what qualities cause neighborhood decline but also how can housing policy makers prevent a bad equilibrium?

While we cannot observe the traditional neighborhood change in the Singapore's context, the analysis of the five years block level panel data of the feedback records reveals spatial clustering in terms of man-made physical environment and social behavior. We categorize and map 57107 records across 144 residential blocks and analyze the trends and patterns of report rates across categories, locations and time. Our analysis builds on the literature on “tipping point”, a level of the physical quality that once exceeded sets off a rapid exodus of the lower social quality. The blocks with the physical quality above threshold experienced losses in their social quality. These blocks also tend to cluster within neighborhoods that experience slow value growth.

UNEVEN QUALITY-OF-LIFE, WEAK MARKETS, AND OTHER BLIND SPOTS IN BUFFALO'S RESURGENCE NARRATIVE: A FOCUS ON EQUITY

Abstract ID: 788

Individual Paper Submission

WEAVER, Russell [Texas State University] rcweaver@txstate.edu, presenting author

KNIGHT, Jason [SUNY Buffalo State] knightjc@buffalostate.edu, co-author

BUKI, Charles [czb, llc] cbuki@czb.org, co-author

As local media outlets and elected officials continue to tout a “resurgence” in Buffalo, New York—evidenced by rising property values, the return of businesses, and new amenities attracting younger residents (e.g., Epstein, 2015; Kaminer, 2016; Sommer, 2016)—it is tempting to think that a rising tide is lifting all boats in the Queen City of the Great Lakes. Nevertheless, each year Buffalo continues to be ranked among the most segregated and impoverished cities in the United States. The citywide poverty rate is just over 30 percent, and one in two school-age children live beneath the poverty line. At the same time, high levels of neighborhood distress characterize wide swathes of the City. In neighborhoods on the City’s East Side, despite thousands of demolitions, vacancy rates from 30–40 percent are quite common. On those grounds, it seems likely that Buffalo’s “resurgence” is occurring unevenly and inequitably. This paper engages with this theme by asking three central questions. First, how and to what extent do quality-of-life (QoL) indicators—namely, (1) walkable access to amenities, (2) residential housing conditions, and (3) housing affordability—vary spatially across Buffalo’s neighborhoods? Second, what are the demographic and socioeconomic characteristics of residents living in Buffalo’s neighborhoods, and [how] do these characteristics relate to patterns of QoL indicators? And, third, who are the people currently moving into Buffalo’s neighborhoods, and what implications do in-migration patterns have for the prospects of “resurgence” within the City? To answer these questions, we draw on data from the U.S. Census Bureau, WalkScore®, the City of Buffalo, and a comprehensive, parcel-level field survey of residential housing quality in the City. Using a combination of spatial and statistical analyses, we find that, among other things: (1) at present, much of the “resurgence” and reinvestment happening in Buffalo is concentrated in relatively walkable neighborhoods downtown and on the City’s West Side; (2) areas with low access to walkable amenities and low vehicle ownership rates are disproportionately Black and impoverished, with very low housing values and high vacancy rates; (3) a rising number of households in neighborhoods that rank poorly on QoL indicators are cost-burdened, despite living in areas with below-average housing conditions; (4) the housing market in some of the most distressed neighborhoods of the City is extremely weak if not non-existent; and (4) in-migrants to some of the most distressed neighborhoods tend to have incomes below the poverty level. Taken together, these and related findings from the paper suggest that planning for and managing patterns of resurgence and reinvestment in Buffalo must be more explicitly tied to social and economic justice objectives. Simply allowing the market to lead reinvestment is resulting in polarized geographies of high quality, walkable neighborhoods with high quality housing and appreciating home values on one hand; and low quality, distressed neighborhoods that lack walkable amenities, have weak housing markets, and are becoming poorer over time on the other. As such, planners should be cautious about buying and selling “resurgence” narratives in cities where uneven patterns of (re)development are persistent. Instead, planners and policymakers should push for equitable and just policies that support residents across the typology of neighborhoods.

HOW HOUSING COST BURDENS INFLUENCE THE RESIDENTIAL CHOICES OF HOUSING VOUCHER RECIPIENTS

Abstract ID: 789

Individual Paper Submission

JEON, Jae Sik [University of Maryland, College Park] jsjeon11@umd.edu, presenting author

DAWKINS, Casey [University of Maryland, College Park] dawkins1@umd.edu, co-author

The Housing Choice Voucher (HCV) is a tenant-based housing subsidy program designed to reduce housing cost burdens for qualifying low-income households. The U.S. Department of Housing and Urban Development (HUD) covers the portion of the rent that exceeds 30 percent of a household's adjusted gross income up to a payment standard, which is HUD's estimate of the amount needed to cover rent and utility costs in a given metropolitan area. While HUD requires that voucher recipients spend no more than 40 percent of their income on rent when initially entering the program or moving to a new unit, Dawkins and Jeon (2017) find that many voucher recipients still spent more than 40 percent of their income on housing costs over the 2003 to 2015 period, particularly when renting a unit priced above the payment standard.

One explanation for the high housing cost burdens of some HCV recipients is that the program is designed in part to expand housing choice in a wider variety of neighborhoods that provide economic and social opportunities. Evidence suggests that living in these "high opportunity" neighborhoods improves the likelihood that children living in poverty will earn higher incomes upon reaching adulthood (Chetty, Hendren, and Katz, 2016). If high cost burdens are associated with improved access to high opportunity neighborhoods, then higher housing costs may be the offset by access to improved neighborhood amenities. On the other hand, high housing cost burdens may also result from increased rent in the neighborhoods originally chosen by HCV recipients. Few studies have examined these tradeoffs. Dawkins and Jeon (2017) find that those initially leasing a unit below the payment standard were more likely to incur higher housing costs upon mobility, but this study did not explore the impact of mobility on access to neighborhood amenities.

In addition, less is known about how HCV recipients make residential decisions in response to changes in rent and changes in income over time. If high cost burdens persist or rise over time, households may move to reduce housing costs or stay and increase work hours to afford the current rent. Colburn and Allen (2018) find that moving did not reduce residential housing cost burdens in the post-recession years unless incomes rose. While a few studies have decomposed changes in housing affordability into changes in rent and changes in income (Quigley and Raphael, 2004; DiPasquale and Murray, 2017), we know little about how changing economic and rental market conditions affect the housing and neighborhood choices of HCV recipients, especially for those who spend more than 40 percent of their income on rent.

Extending our previous work, this paper explores the longitudinal trajectories of HCV program participants who initially leased a unit in 2003, and examines the impact of housing cost burdens on residential mobility. We employ data from HUD administrative files to characterize the housing and neighborhoods of cost-burdened HCV recipients over the 2003 to 2015 period. These analyses are designed to address the following research questions: What are the dynamics of housing cost burdens and neighborhood outcomes? How have voucher households responded to changes in rent and changes in income when making residential choices? We find that HCV recipients are willing to incur higher cost burdens to improve or maintain access to certain neighborhood amenities. We also find that changes in income play a larger role than changes in rent in altering a household's housing cost burden.

IMPACTS OF HAZARD MITIGATION GRANTS ON INDIVIDUAL AND COMMUNITY LEVEL POST-DISASTER RESILIENCE

Abstract ID: 810

Individual Paper Submission

SCHWALLER, Nora [UNC Chapel Hill] nschwall@gmail.com, presenting author
 NGUYEN, Mai [University of North Carolina] mai@unc.edu, co-author

While cost-benefit analyses show that the federally funded Hazard Mitigation Grant Program (HMGP) is economically advantageous to the society at large [1], it is far from guaranteed that the individuals and local communities involved in the program will benefit from their participation [2]. The limited existing research that is focused on the resident as the unit of analysis reveals varying degrees of satisfaction with the process. At the individual level, these programs often prove to increase social vulnerability and inconsistently deliver greater physical resilience [3]. At the community level, smaller municipalities may risk obsolescence as their communities and tax bases are hollowed out.

Notably, there is scant research on what factors influence individuals' decisions to participate in these programs or how they perceive the benefits and limitations of the strategies available. To systematically study this phenomenon, we are using a uniquely available FEMA dataset of the 800 HMGP recipients in North Carolina who have been granted funds in the wake of Hurricane Matthew in 2016. We analyze the recipients' considerations for selecting among three mitigation strategies: accepting a buyout, elevating their property, or demolishing the existing structure and rebuilding in place. This allows for a quasi-experimental investigation into the perceived values of various HMGP options.

The survey was designed to gather characteristics of the residents and their pre-disaster residence; and to offer insight into the participant's priorities regarding resiliency, community character, and desired institutional amenities. We present an analysis of a multinomial regression model of applicants' choices (buyout, elevate, demo-rebuild) with regards to their personal recovery priorities and controlled for census-tract-level demographic data. Furthermore, results are contextualized with a second data set of the 81,502 applicants for FEMA's Individual Assistance Program (IA). The IA dataset represents a larger program that was intended to reach almost all residents negatively affected by Hurricane Matthew.

Finally, we investigate the relationship between individual- and community-level resilience. Certain decisions, such as the choice to accept a buyout and move to a different locality, increase individual resilience at the expense of community resilience. This can negatively impact those who chose to remain and rebuild in the face of a reduced community, leaving them more socially vulnerable even as their physical property is better prepared to withstand greater environmental disruptions. A spatial analysis on the clustering of different decisions allows us to investigate the relationship of neighboring choices considering the total number of HMGP recipients making the same decision. This will be placed in the context of both the total number of HMGP recipients and the total number of occupied residences in a given area. This work sets the stage for a future longitudinal study analyzing the realized benefits and losses at both the individual and community levels.

THE EFFECT OF CHANGES IN CENTRAL CITIES ON RESIDENTIAL LOCATION OF MILLENNIALS

Abstract ID: 828

Individual Paper Submission

SHIN, Jaeyong [University of Illinois at Chicago] jshin75@uic.edu, presenting author
TILAHUN, Nebiyou [University of Illinois at Chicago] ntilahun@uic.edu, co-author

More millennials seem to prefer city living. However, our understanding of why they to prefer cities is still growing. Their preference for cities might depend on the history, geography, socio-demographic and economic character, and the built environment offered by the different city environments. One expects to see variation in the migration patterns towards different cities based on the amenities they offer and the current state of affairs in these cities. This claim is supported by a comparison of population change across all age groups and for young people (aged between 15 and 34) between 2000 and 2010 in the 50 most populous U.S. cities using census data.

The population change among 48 of these 50 cities shows substantial variation in growth rates. Many of the largest cities have seen growth in overall population as well as the population of young people. Approximately 30% of cities have seen a higher growth rate among 15-34 year olds than in total population (e.g., Washington, D.C., Miami, and Boston). In 10% of places, both total population and the population of young people has fallen (e.g., Chicago, Detroit, and Cleveland). In 13% of cities, the population of young people in cities has shown a decline while overall population may have grown (e.g., San Jose and San Francisco), while 8% of cities have shown the opposite trend (e.g., Baltimore and Milwaukee). Overall the change indicates substantial variation in the population growth of large U.S. cities. Given these observed differences in how attracted Millennials were to some cities than others, this paper investigates what factors explain these observed differences.

We start with the hypothesis that factors in central cities influence the residential choice of Millennials and explain the attractiveness of different cities to Millennials. In particular, we focus on new development in urban cores relating to four major factors that influence people’s residential location choice in the literature. These four factors are housing, transportation and accessibility, urban amenities as a neighborhood attribute, and occupational changes as an economic attribute. The results will inform the impact of the urban core development along these dimensions on Millennials’ choice and will help explain differences between the cities.

The data used for the analysis and a statistical model are the 2000 Census and 2010 ACS data. The analysis focuses on the largest U.S. (top 50 by population) and 45 MSAs in which these cities are situated. To examine the difference between the city groups and the effect of the change in the urban cores, we use the difference-in-difference (DID) technique. The treatments (city groups) are the new development of the four factors in the urban cores between 2000 and 2010. We investigate the population change in Millennials along with changes in new housing structures, the transportation infrastructure, the use of public transit or walk and bike modes, whether the high-wage occupation has changed, and whether urban amenities have changed.

DID is usually implemented as an interaction between time and treatment group dummy variables in a regression model (1). The estimated model will be used to investigate the effect of the development of central cities and its effect on the increase of younger population.

$$Y = \beta_0 + \beta_1[\text{Time}] + \beta_2[\text{Treatment}] + \beta_3[\text{Time} \times \text{Treatment}] + \beta_4[\text{Covariates}] + \varepsilon \quad (1)$$

The analysis here is expected to show the effect of development in central cities on the decision of Millennials to choose them as places of residence as well as the difference to older adults. This study will contribute to increase our understanding of Millennials' choices and provide insights to cities that may want to share in the growth of their young adult population.

COPING WITH RENT BURDEN: SACRIFICE, SOCIAL SUPPORT, AND A BETTER FUTURE

Abstract ID: 837

Individual Paper Submission

ANGST, Sean [University of Southern California] angst@usc.edu, presenting author

ROSEN, Jovanna [University of Southern California] jovannar@usc.edu, co-author

PAINTER, Gary [University of Southern California] gpainter@usc.edu, co-author

Households throughout the United States are simultaneously experiencing worsening inequality and an increasingly unaffordable housing market. As low-income residents are forced to spend a greater share of their limited incomes on rent, they must make tragic choices—between paying rent and basic necessities such as food, education, energy, parenting time, and healthcare—which ultimately produces dire consequences and enormous stress intergenerationally (Diaz McConnell, 2016; Newman & Holupka, 2015). Although connections between rent burden and trade-offs have been made, little is known about the impact these decisions have on life outcomes or the mechanisms through which these outcomes are produced. Moreover, existing research demonstrates that engagement with support networks serves as a key coping strategy within immigrant communities, yet it has not been captured in relation to housing costs (Dominguez & Watkins, 2003; Stanton-Salazar & Dornbusch, 1995).

In response, the Sol Price Center for Social Innovation has partnered with organizations in South Los Angeles and the Coachella Valley to conduct focus groups to better understand the complex and cumulative effects of rent burden. These focus groups have revealed the extreme stress and isolation that residents face as a

result of growing costs of living. Our study investigates the sacrifices residents are forced to make in order to cope with rent burden, and seeks to lift up how these decisions are made as well as the policy interventions residents would like to see implemented to address the affordability crisis. In addition, the project examines the ways households leverage social support networks—both formal and informal—to meet the pressures resulting from unaffordability and share risk across the broader community.

We employ a comparative case study design utilizing 30 focus group sessions and participant surveys across Los Angeles and the Coachella Valley to reveal how immigrant and nonimmigrant families differentially cope with rising housing costs across the region. Preliminary evidence from focus groups suggests that immigrant and historically marginalized communities appear particularly impacted, due to their additional vulnerability from reduced institutional support and a greater dependence on low-wage work. These focus groups have further revealed instances in which rent burden coping strategies and their impacts extend far beyond consumption trade-offs, with implications for broader social support networks. While many families lack access to social and institutional support, certain groups are able to draw from social networks to cope with challenges. Our findings indicate pivotal differences in the ways that some residents disperse risk across larger networks, which can unintentionally serve to heighten vulnerability across their entire community. The dispersed and shared effects of rent burden offer crucial information for understanding the ways residents cope, and the effects these decisions have on their lives and their families.

Our proposed design will expand understanding of rent-burden through a micro-level analysis that examines the ways families adapt and sacrifice to survive the current affordability crisis. As private and public capital continues to flow into previously under-invested communities, rising property values and rent will only accelerate rent burden pressures, which inevitably have far-reaching consequences. Furthermore, the community-based approach highlights the goals and aspirations of residents, exposes barriers to their ideal housing situation, and elevates policy interventions sourced directly from the community. The areas identified exist within collective impact initiatives that involve active engagement and organizing to improve neighborhood conditions for low-income residents. Their location within these collective impact initiatives provides strong institutional partners for the research and a pathway for policy remediation based on the results.

ESTIMATING THE RELATIONSHIP BETWEEN AFFORDABLE HOUSING AND INTERGENERATIONAL MOBILITY

Abstract ID: 838

Individual Paper Submission

SHAMSUDDIN, Shomon [Tufts University] shomon.shamsuddin@tufts.edu, presenting author

A core component of the American Dream is the possibility of intergenerational mobility: children raised in poor families can grow up to earn more money as adults than their parents. Recent work documents substantial variation in intergenerational mobility across the U.S. and identifies the causal effects of growing up in different counties (Chetty and Hendren, 2016). But the reasons for these differences between places are unclear.

Affordable housing is a potentially important channel for intergenerational mobility. Housing is the single largest expense for most families and its share of household budgets is growing (Albouy et al., 2016; BLS, 2015). Housing costs exceed 30% of income—the standard measure of unaffordability—for nearly one-third of all U.S. households, including one-in-six households that spend more than half of their income on rent (JCHS, 2016).

Economic theory suggests programs that reduce housing costs for families could enable them to invest more income in increasing their children's human capital (Leventhal and Newman, 2010). Indeed, much low-income housing policy is premised on the idea that reducing housing costs will encourage self-sufficiency and economic mobility (Shroder, 2002; Vale, 2000). However, affordable housing programs have eligibility, payment, and location restrictions that may discourage increased earnings and child development (Olsen, 2003).

Prior empirical research on the impact of housing costs yields mixed support for the presumed benefits of affordable housing for families and children. Low housing prices are associated with positive effects on grade advancement and risky behavior for poor children (Harkness and Newman 2005). But high housing costs are not associated with corresponding negative effects on children's academic achievement and engaging in criminal activity (Harkness et al. 2009).

In this paper, I examine the effects of affordable housing on geographic differences in intergenerational economic mobility for low-income households. The analysis draws upon mobility data from the Equality of Opportunity project (Chetty and Hendren, 2016), demographic data from the U.S. Census, and housing program administrative data from the U.S. Department of Housing and Urban Development (Vale and Shamsuddin, 2017). Using multivariate regression analysis, I estimate the relationship between public housing supply and the chances that children growing up in the bottom income quintile eventually exceed their parents' earnings. Initial results indicate that the availability of public housing is not significantly associated with differences in children's upward economic mobility across places. The findings suggest that although public housing may reduce housing expenditures for some poor households, it is not necessarily a platform for widespread intergenerational mobility.

BEYOND THE OWNER-RENTER DIVIDE IN DISASTER PLANNING: A GEOGRAPHICAL ANALYSIS OF MOBILE HOME PARK DAMAGE AND RECOVERY AFTER HURRICANE HARVEY

Abstract ID: 846

Individual Paper Submission

RUMBACH, Andrew [University of Colorado Denver] andrew.rumbach@ucdenver.edu, presenting author
SULLIVAN, Esther [University of Colorado Denver] esther.sullivian@ucdenver.edu, co-author

Mobile homes are a significant, but often unacknowledged, part of our nation's affordable housing supply. Today, mobile homes are the single largest source of unsubsidized affordable housing in the United States. An estimated 2.9 million mobile homes are located within mobile home parks (MHPs), which are unique land-lease communities where households own their housing unit but rent the land underneath. Considered together, MHPs represent a substantial portion of the country's affordable housing supply, providing more than twice as many

units as public housing. The population living in MHPs is predominantly low-income and includes many elderly, disabled, non-white, and non-English speaking individuals.

Mobile home parks are frequently exposed to hazards and disasters. In 2017 alone, floods, hurricanes, and wildfires triggered disasters in Texas, Florida, and California, the three states with the largest populations living in mobile homes. Past research has shown that affordable housing is a key component of the built environment that is at-risk from natural hazards and an important contributor to post-disaster recovery. The limited scholarship on affordable housing and disasters has focused almost entirely on site-built housing, however, and largely overlooked MHPs. Because of the unique characteristics of MHPs – their mixed tenure arrangements, park ownership structure, and treatment under local laws and regulations – we hypothesize that MHPs are exposed to, and recover from, disaster events differently than other affordable housing types.

Texas, Hurricane Harvey, and the Houston metropolitan area present a unique nexus to study the vulnerability of mobile home parks to disasters, across different geographic, demographic and governance contexts. Texas, the state with the largest mobile home population, also outranks all other states in deaths, injuries, and property loss resulting from floods. The largest share of Texas' roughly 1.9 million mobile home park residents (17.7%) lives in the Houston area. At least 100,000 housing units were damaged or destroyed in Texas after Harvey, many in Houston, including approximately 400 mobile home parks. Those parks, each of which may contain dozens or hundreds of homes, are located throughout 100 towns, cities, and municipal areas that make up the greater Houston Metropolitan Statistical Area, a 9-county region the size of Massachusetts.

In this paper we utilize a mixed-methods research design to study the geography of exposure and recovery of MHPs in the Houston MSA after Harvey. First, we locate all MHPs in the 9-county region using tax record data (N=1437). Next, we overlay Harvey flood models to estimate the extent, and magnitude, of flood exposure. Third, we use pre-Harvey remotely sensed imagery to count the number, and type, of mobile homes in each park (N=~400). We then use post-Harvey imagery to estimate the level of damage and unit loss for each park. Finally, we visit a sample of parks to ground-truth our findings. These findings represent the first-time, comprehensive and comparative analysis of the exposure and recovery of the mobile home park housing stock of a major metropolitan area following an extreme event. They allow us to understand which parks, in terms of their physical location, ownership structure, and treatment under local laws and regulations, are most likely to suffer damage and to recover after loss. These findings will help planners to more accurately account for vulnerability in the affordable housing stock and design more effective hazard mitigation or community resilience plans and strategies.

SOCIODEMOGRAPHIC REPRESENTATION OF ONLINE RENTAL HOUSING LISTINGS: INFORMATION SURPLUSES AND DEFICITS

Abstract ID: 858

Individual Paper Submission

BOEING, Geoff [University of California, Berkeley] gboeing@berkeley.edu, presenting author

Large portions of the rental housing market have moved online over the past 10 years. Traditionally, rental listings appeared in local newspapers. Now they are primarily posted on web sites like Craigslist, which holds a near monopoly in the online rental listings space and is the 15th most-visited web site overall in the US today. However, it is not well-understood how Craigslist represents the complete rental market. Are different kinds of communities, built environments, and demographic groups over- or under-represented in these online rental listings?

Few researchers have studied large-scale Craigslist rental listings directly, due to the technical complexity of acquiring the data. Some recent studies, however, have hand-tabulated Craigslist listings to study individual metropolitan markets (e.g., Wegmann and Chapple 2013). Most studies of demographic representation on Craigslist have focused on the Fair Housing Act and racial discrimination by landlords (e.g., Decker 2010). Another stream of literature has considered demand-side factors in Internet use and housing search. Rae (2015) demonstrates how user-generated search areas spatially represent housing submarkets. But such online housing searches depend on Internet usage: Mossberger et al (2012) explore how Internet use and digital inequalities vary as a function of demographic characteristics and neighborhood effects. However, these studies of market representation and participation focus on demand. The online representation of available rental housing supply remains underexplored.

To address this knowledge gap, this study presents an approach for evaluating over- and under-representation on Craigslist at the census tract scale. It uses the dataset developed by Boeing and Waddell (2017), who collected 11 million Craigslist rental listings across the US. First it spatially joins these rental listings to the 12,000 census tracts within the core cities of the 50 most populous US metropolitan statistical areas. Then it separately creates a counterfactual proportional reallocation of these listings, per-city, to compare how the observed distribution deviates from the proportional distribution. Next it explores the differences in demographic and built environment characteristics between these over- and under-represented tracts. Finally, it estimates a multiple regression model to examine *ceteris paribus* effects of these characteristics on Craigslist representation.

Based on Gini coefficients, rental listings are more concentrated into fewer tracts than a proportional distribution would be. Some rental markets – including Hartford, Miami, Philadelphia, and Boston – demonstrate an extreme spatial compression of listings. Tracts over-represented on Craigslist are significantly better educated, whiter, and richer, contain more college students and English-only speakers, and feature higher gross rents and smaller household sizes than under-represented tracts. Controlling for rental turnover, vacancy rates, and other demographic and neighborhood characteristics: higher incomes, higher rents, and larger shares of the population that are white, 20-34 years old, college/grad students, and speak English-only predict greater representation on Craigslist. Similarly: smaller household sizes, newer housing stock, shorter commutes, and closer proximity to the city center predict greater representation.

As the market moves online, data sources like Craigslist offer an opportunity to monitor and understand affordability and the supply of rental housing in real-time. However, they do not provide a holistic, unbiased window into the housing market. This study unpacks how this market functions as an information exchange that over- or under-represents different communities. It also provides a glimpse into the supply side of digital inequality: housing seekers in whiter, wealthier, better-educated, and more-expensive communities are offered a surplus of information online to aid their search, while seekers in other communities face an information deficit. This affects the reinforcing feedback loops of supply-and-demand in community usage as well as the conclusions that housing planners can draw from these data.

THE IMPACT OF HCV CONCENTRATION ON PERCEPTIONS OF NEIGHBORHOOD CONDITIONS

Abstract ID: 861

Individual Paper Submission

JARAMILLO, Atticus [University of North Carolina at Chapel Hill] atticusa@live.unc.edu, presenting author
 ROHE, William M. [University of North Carolina] brohe@unc.edu, co-author
 WEBB, Michael [University of North Carolina at Chapel Hill] webbmd@unc.edu, co-author

The Housing Choice Voucher program (HCV) is often conceptualized as a tool for mitigating concentrated poverty and racial segregation in U.S. cities (Turner 1998). However, a large body of literature finds that many HCV holders live in segregated, high-poverty, low-opportunity neighborhoods with elevated crime rates (Galvez 2010; McClure 2010). HCV holders' concentration in these neighborhoods has led researchers to examine push and pull factors that influence voucher holders' location decisions, in addition to proposing numerous mobility programs to encourage voucher families to move to higher-opportunity areas (Eriksen et al., 2013, 2015; Varady & Walker, 2003).

Less known, however, is how voucher holders themselves perceive their own neighborhoods. In response, this study examines how subjective perceptions of safety, social cohesion, and neighborhood satisfaction differ among voucher holders vis-à-vis their objective neighborhood characteristics. It utilizes survey data to assess voucher holders' perceptions of their neighborhoods' safety and social cohesion, and overall neighborhood satisfaction differ across residential contexts. The study also uses secondary data to compare the relationship between objective and subjective neighborhood characteristics. The paper will address the following questions:

1. (1) How do voucher holders perceive their neighborhoods' safety and social cohesion, and how satisfied are they with their neighborhoods?
- 2.
3. (2) How do perceptions of safety, social cohesion, and neighborhood satisfaction differ among voucher holders in relation to their objective neighborhood characteristics?
- 4.
5. (3) How do individual characteristics—such as race, employment status, and gender—moderate voucher holder's perceptions of their neighborhoods?

Primary data will come from a mail survey questionnaire being sent to 1,000 HCV holders in Charlotte, NC. We will also use secondary data for descriptive information on voucher holders' household compositions, rent amounts, and addresses. This data is maintained by the Charlotte Housing Authority.

This project has important implications for housing policy research and practice. First, it will clarify how HCV holders perceive neighborhood conditions across different residential contexts, and relate these perceptions influence overall levels of neighborhood satisfaction. Second, it will examine how individual characteristics affect HCV holders perceptions of their neighborhoods. As the nation continues to transition to a voucher-based housing subsidy system, the analysis of these questions will become increasingly important to policymakers and elected officials.

THE PREVALENCE AND CONSEQUENCES OF HOUSING EVICTION IN MISSOURI

Abstract ID: 862

Individual Paper Submission

HAN, Hye-Sung [University of Missouri-Kansas City] hanhs@umkc.edu, presenting author

Over the past several decades, housing in the United States has become increasingly unaffordable, especially for renters. One in four renters spends over half of their income on rent. Among low income renters, the severe cost burdens often result in evictions and chronic homelessness. Eviction is believed to be the leading cause of homelessness because many landlords and property managers are reluctant to rent to people with evictions on their record. Housing evictions are common. For example, in Jackson County, Missouri, 173,720 evictions were filed between 1999 and 2016. This translates to 42 evictions filed per business day. This tells only part of the story; there are a potentially significant number of renters who are displaced through what might be considered informal evictions. Evicted renters are more likely to lose their jobs, suffer from depression, and end up in substandard housing in distressed neighborhoods.

Despite the prevalence of evictions, this topic has been hardly studied. Examining the eviction filing records in Jackson County (Kansas City, MO), St. Louis County, and city of St. Louis in Missouri between 2009 and 2016 and a number of neighborhood characteristics, this research addresses the following research questions: 1. How often and why are families evicted? 2. Where are families evicted from? Is there any relationship between the prevalence of evictions and specific neighborhood characteristics such as measures of housing affordability and neighborhood quality? 3. What are the significant impacts of eviction on families and neighborhoods such as its impact on student mobility?

A preliminary analysis of data reveals that housing evictions are very common. By far the most-often cited reason for filing an eviction case was nonpayment of rent. Housing evictions are disproportionately concentrated in a few low-income minority neighborhoods. Racial disparity in housing eviction is observed. There is very limited financial assistance and social services available to families who are evicted or at imminent risk of eviction. This research hopes to attract more scholarly and public attention to housing eviction problems that have been neglected and, in turn, better inform public policies.

GENTRIFICATION AND DISPLACEMENT IN TWO BRIDGES: COLLECTIVE ACTION TO PRESERVE AN AFFORDABLE IMMIGRANT WATERFRONT NEIGHBORHOOD IN NEW YORK

Abstract ID: 904

Individual Paper Submission

BARON, Eve [Pratt Institute] ebaron@pratt.edu, presenting author

SRIRAM, Pavithra [Pratt Institute] psriram@pratt.edu, co-author

New York City's Two Bridges waterfront neighborhood, located in the area immediately surrounding the Brooklyn and Manhattan Bridges, has long been a working-class and immigrant enclave of diversity and affordability in Manhattan's Lower East Side. There are several New York City Housing Authority (NYCHA) complexes, and several rent protected units through the City of New York's Mitchell-Lama Housing Program. Adjacent to the Chinatown and Lower East Side neighborhoods, Two Bridges is largely a Chinese and Latin American immigrant neighborhood.

Currently, Two Bridges is the site of several proposed large-scale residential development projects that threaten its historic character and long-term affordability. In 2014, construction began on the 80-floor, 815-unit One Manhattan Square project. Following this are proposals for three additional buildings in what is known as the Two Bridges Large Scale Residential Development (LSRD) area, a former Urban Renewal Area, each of which will measure more than 700 feet tall, and will cumulatively contribute more than 2,000 market-rate housing units to a primarily low- and middle-income neighborhood. Local residents have expressed considerable resistance, citing concerns with impacts on transit infrastructure, automobile and pedestrian traffic congestion, school crowding, and housing affordability and displacement, amongst other fears.

Locals are also concerned about the insufficiency of the City's current environmental review protocol to accurately measure impacts and require meaningful mitigation, and the fairness and adequacy of the opportunities for public input in the review process. Perhaps more concerning is that some constituencies in Two Bridges are more likely to be displaced than others, i.e., those with lower incomes, those who live in buildings subject to rent decontrol, those for whom English is not their first language, those whose rent is more than 30 percent of their income, and those who are elderly. In the Two Bridges neighborhood, as in other parts of the city, most of those most at risk are also people of color.

The Two Bridges community and other parts of Chinatown had come together in a five-year community-based planning process to develop a pro-development, consensus-based plan for the preservation of culture and affordability, an initiative developed with participants as disparate as community activists and business groups; developers and housing organizers; and quasi-government agencies and workers organizations. NYC's current mayor decried the plan as "too ambitious" and the community has been left to scramble for ways to implement the plan on their own, including a first-ever community-driven, community-created rezoning application. Their continued activism and their struggle to maintain community raises questions: What is the potential impact of community-based planning and civic action in thwarting gentrification and displacement in strong real estate markets? Additionally, in potential luxury, waterfront markets, how does municipal response to sea level rise and climate change complicate waterfront communities' ability to gain traction in the development process?

To begin to answer these questions, our research team is engaged in participatory action research with a community partner, Tenants United Fighting For the Lower East Side (TUFF-LES). We have provided technical assistance in the preliminary environmental review, conducted interviews, documented the community planning process, and track all developments in the land use process in the area. This work is ongoing and dynamic as the community evolves its response.

Our work with the community groups illuminates the potential of cross-sector approaches to anti-gentrification strategies. It also provides insight into strategies available to multi-ethnic, multi-generational communities attempting to influence the development process in strong markets. While the research and action is ongoing, early analysis suggests that the more cohesive the community can remain, the more traction they will gain.

HOW LONG IS LONG-TERM?: HOMEOWNER AFFORDABILITY AND SECURITY IN CHICAGO COMMUNITY LAND TRUST PROPERTIES

Abstract ID: 906

Individual Paper Submission

PROCHASKA, Natalie [The University of Illinois at Urbana-Champaign] prochask@illinois.edu, presenting author

The benefits most often listed by advocates of the community land trust shared equity homeownership model include stable and longer-term housing tenures and the opportunity for wealth accumulation through home value appreciation (Davis & Stokes, 2009; Temkin, Theodos, & Price, 2010; Towey, 2009). These models preserve affordability across successive generations by splitting ownership of land from structural improvements, which decrease structural costs and share the responsibilities and risks of traditional homeownership (Davis, 2010). Critics of the CLT model argue that limiting wealth accumulation by capping financial returns at resale harms participating families in the long-term.

Previous research demonstrates persistent bias against minority and low-income homebuyers (Apgar & Calder, 2005; Herbert & Belsky, 2008; Immergluck, 2009; Quercia & Spader). Because home equity accounts for the majority of wealth amongst low-income and minority households, promoting access to financial tools necessary to achieve stability in home financing is a vital step in creating systemic support with interlocking positive stabilizing effects for these households (Rohe, Van Zandt, & McCarthy, 2002). Longitudinal studies have documented the longevity of homeownership tenure and found that 50% of first-time, low-income and minority homebuyers reverted back to renting five years after purchase, and other research has documented that to realize equity gains on low-cost homes, homeowners must maintain ownership for 5-10 years (Belsky & Duda, 2002; Belsky, Retsinas, & Duda, 2005; Boehm & Schlottman, 2004; Haurin, Dietz, & Weinberg, 2002; Haurin & Rosenthal, 2004; Katz Reid, 2018). Short durations of tenure, high-cost home purchase, trigger events, and high housing cost burdens are more likely to combine to produce debt than wealth for lower income and minority households today (Herbert & Belsky, 2008; Robertson, Egelhof, & Hoke, 2008).

Using Chicago as a case study, I evaluate the duration of real estate holding patterns for families participating in shared equity homeownership models and ask what the tenure threshold is for wealth accumulation. I also examine the overlap between the presence of CLT mortgage lenders and financial tools available for other shared equity social housing initiatives in the City of Chicago (for example, blanket mortgages for limited equity housing cooperatives) to examine the potential for broader neighborhood access to financial instruments that facilitate housing security for low- and moderate-income households. This research has important implications for communities across the country working to provide solutions to the current housing crisis.

NATIONWIDE EXAMINATION OF THE SPATIAL MISMATCH CONDITIONS ACROSS 100 LARGEST METROPOLITAN AREAS IN THE UNITED STATES

Abstract ID: 922

Individual Paper Submission

QI, Yunlei [UNIVERSITY OF MINNESOTA] yunleiqi@umn.edu, presenting author
FAN, Yingling [University of Minnesota] yingling@umn.edu, co-author

Problem and Method: The socioeconomic context of spatial mismatch may have changed in recent decades. Housing conditions and central city growth may have alleviated spatial mismatch conditions. In this article, the nationwide spatial mismatch of low-/middle-/high-wage workers in 2015 are quantified based on their 30 and 60 minutes transit and auto accessibility in the largest 100 metropolitan areas across the U.S. The LEHD data are combined with accessibility data available at the Accessibility Observatory at the University of Minnesota to understand workers' spatial mismatch with auto- and transit-accessible jobs within 30 and 60 minutes of travel during morning peak hours.

Results and Conclusions: The results indicate that high-wage workers tend to have higher spatial mismatch indexes (SMIs) based on transit accessible jobs than low- and middle-wage workers do. Regardless of wage levels, the larger metropolitan areas tend to have more severe spatial mismatch conditions. This indicates that job accessibility issues are most prevalent in the largest metropolitan areas. The results of SMIs based on auto-accessible jobs present a different pattern. The high-wage workers in general have lower SMIs than the low- and middle-wage workers do in most metropolitan areas for auto-accessible jobs. Moreover, the spatial distribution patterns between the SMIs based on auto-accessible jobs and the ones based on transit-accessible jobs in the metropolitan areas are different. Similar to the SMIs calculated based upon transit accessible jobs, auto accessibility-based SMIs tend to decrease when the population size get smaller, but there are some metropolitan areas whose population-size based ranks are after 55 have high SMIs based on the auto-accessible jobs within 60 minutes.

Take Away for practice: The results of this study have verified the disadvantaged conditions of the spatial mismatch based on the auto-accessible jobs experienced by low- and middle-wage workers. However, the spatial mismatch conditions based on transit-accessible jobs of low- and middle-wage workers are better than the spatial mismatch condition of the high-wage workers. The spatial distribution of SMIs indicates positive relationship with population distribution among the metropolitan areas. The larger the region, the worse the spatial mismatch condition could be. More investment on transit systems in large metropolitan areas is likely to alleviate the spatial mismatch problem across the nation.

THE LENGTHS OF WEAK TIES: SOCIAL NETWORKS AND GEOGRAPHIC MOBILITY

Abstract ID: 934

Individual Paper Submission

GRAVES, Erin [Federal Reserve Bank of Boston] erin.m.graves@bos.frb.org, presenting author

The quality of the neighborhoods households live in matter for individual well-being. Broadly, planners have used two strategies to help poor households increase their exposure to enriching neighborhoods: improving the neighborhoods poor people live in and enabling poor people to move to higher resourced communities. Achieving improvements though mobility has proven an effective strategy (Chetty et. al, 2016, Quillian, 1999) and much of this is implemented through the use of housing choice vouchers. Surveys and interviews with voucher recipients consistently show that voucher recipients would prefer to locate in safe and quiet neighborhoods with quality schools for their children. However, voucher users often don't relocate to neighborhoods with these desirable features because their choices are constrained (Tighe, Hatch, Mead, 2016).). Increasingly, the voucher mobility literature has considered the role of social networks in determining potential housing choices (Gould et. al, 2016).

The larger, general literature on networks looks beyond the presence of social networks to their types and an enormous body of literature shows that weak ties are essential for getting ahead (Granovetter, 1979). From the individual's point of view weak ties are a potentially important resource for mobility to opportunity areas. However, poor people tend to have social ties which are both strong and low-income. Therefore, even when voucher holders' housing budgets increase so that higher resource neighborhoods are more affordable, they often do not know people in those neighborhoods to provide them with information about opportunities (Curley, 2009). Thus, those voucher holders who have or can develop information rich weak ties may more frequently access higher opportunity neighborhoods.

This study draws on an analysis of administrative data from the Boston Housing Authority (BHA) and an original survey data from 128 housing voucher recipients living in both higher and lower opportunity areas across the Boston Metro area and seeks to advance understanding about the network drivers of location outcomes. The survey allows us to explore hypotheses about the role weak ties play in residential selection and to compare households who moved to higher opportunity areas and those who moved to lower opportunity areas. We find that those households who moved to higher opportunity areas used significantly more weak ties in their housing search than those who did not move to higher opportunity areas. This work then reveals some of the mechanisms

through which residential segregation of HCV holders may be channeled and how policy and program interventions can respond.

SHAPING THE FUTURE: DISPOSITIONS OF FLORIDA MILLENNIALS TOWARD TRAVEL MODE AND RESIDENTIAL LOCATION

Abstract ID: 948

Individual Paper Submission

YANG, Xinyuan [University of Florida] poppyyang@ufl.edu, presenting author

STEINER, Ruth [University of Florida] , co-author

STREKALOVA, Yulia [University of Florida] yulias@ufl.edu, co-author

BROWN, Leslie [University of Florida] les.brown@ufl.edu, co-author

Recently, literature has emerged and offers contradictory findings about the causal relations between the built environment and travel behaviors. Along with the belief that the demand for urban living featured with a reduced car dependence is growing, more and more neotraditional neighborhoods are being developed in the United States. However, many researchers consider such development a “market niche” (Schwanen and Mokhtarian, 2007; Morrow-Jones, Irwin, and Roe, 2004). While the initiatives of neotraditional development remain to be disputed, Americans’ behavioral patterns and outlooks are changing with the demographic shift. Millennials, the largest and most diverse generation in American history, currently represent more than a quarter of the U.S. population. Due to the possible effects of the Great Recession and accompanying lifecycle delays, millennials’ perception may seem to be shunning preceding generations’ transportation and residential location choices. In order to explore and understand the transportation and residential location needs and preferences of millennials, this study applies mixed logit models to data from a FDOT (Florida Department of Transportation) survey on millennials. Socio-demographic and lifestyle variables are controlled in the analyses. In addition, attitudes toward travel mode and residential location choices are compared between the demographic cohorts of millennials and baby boomers.

Based on the case of Florida, the results of this study exhibit the millennials’ attitudes toward lifestyle, travel, residential locations, environment and car use. This study highlights some remarkable differences in disposition, in particular, the preference to live in an urban environment and the willingness to use shared modes of transportation, when compared to the previous cohort. As millennials age, their residential and transportation choices will have significant and lasting impacts on Florida’s built and natural environments, with far-ranging economic, equity and public health implications. The findings of this analysis illustrate where transportation and planning efforts are most needed in the following years to accommodate the demands of the current generation.

HEALTHY OR UNHEALTHY MOVES: HOUSING DISPLACEMENT AND SELF-REPORTED PHYSICAL AND MENTAL HEALTH

Abstract ID: 958

Individual Paper Submission

SPURLOCK, Danielle [University of North Carolina] dspurloc@email.unc.edu, presenting author

Research on the social determinants of health identifies structural factors that affect health through risk, exposure, and access, and highlights the central role played by place in physical and mental health outcomes. Neighborhood factors supportive of positive health behaviors include walkable communities, access to green space, healthy food environments, and minimal exposures to environmental pollutants while factors like auto-centric development, poor housing quality (i.e., issues of overcrowding, poor ventilation, mold, and lead exposure), incomplete or poorly maintained infrastructure, public safety concerns, and food environments replete with high calorie, low nutritional value options can hinder health promoting behaviors (Baker, Schootman, Barnidge, & Kelly, 2006; Wen, Hawkey, & Cacioppo, 2006). Substantial progress has been made linking individual health outcomes with these neighborhood level socioeconomic conditions. Lower neighborhood level SES is associated with high prevalence of obesity, cardiovascular diseases, depression, hypertension, and a range of mental health conditions (Diez Roux & Mair, 2010). This paper contributes to the literature connecting neighborhood conditions and health by exploring the relationships between health behaviors and one of the largest components of household expenditures: housing. Specifically, we explore food insecurity and housing costs in a community experiencing gentrification.

Researchers investigating the inclusion of housing cost burdens as a factor in health promoting behaviors articulate two emerging themes: 1) tradeoffs exist between housing and health care expenses resulting in the postponing of health services, and 2) those tradeoffs differ based on housing tenure (i.e., tenancy versus owner-occupied). Postponing medical services to pay for housing costs is more prevalent among those spending more than 50% of their income on housing (Meltzer & Schwartz, 2016) and this effect is more pronounced among renters (Pollack, Griffin, & Lynch, 2010). There is less research into the financial tradeoffs precipitated by housing unaffordability with respect to food insecurity, health promotion behavior, and self-reported stress. We seek to examine these topics with a backdrop of shifting housing costs associated with a gentrifying area.

Gentrification and the possible displacement of lower-income households and small businesses is a controversial topic and is particularly germane in Durham, North Carolina—one of the fastest-growing cities in the United States. Renewed interest in the city's center has increased real estate pressure on six historically black neighborhoods. A recent analysis found increases in median housing prices ranging from 110% to 490% over the last ten years for five of these six communities. The remaining neighborhood, Old East Durham, initially only experienced a 32% increase, but major transit investments (i.e., a proposed light rail transit line) and commercial redevelopment by Self-Help (one of the largest community development financial institutions in the United States) heralded a recent and rapid influx of more affluent residents.

In collaboration with Communities in Partnership, a nonprofit based in Old East Durham, and community residents, we will conduct a door-to-door survey utilizing a random sample of ~250 household stratified by type of housing tenure (i.e., tenancy versus owner-occupied) using community based participatory methods in April 2018. This paper reports on the findings of this survey. Specifically, we will address the following research

question: What are the relationships among housing affordability, attitudes, and beliefs about displacement and/or the threat of displacement, and self-reported health status and behaviors?

This study builds on the literature linking housing expenditures to health with emphasis on how financial tradeoff decisions relate to food security and self-reported physical and mental health. As a contribution to practice, the project continues a dialogue between community stakeholders and decision makers on the topics on disinvestment, gentrification, and displacement and the larger process of integrating local knowledge and technical expertise.

THE AVAILABILITY OF CHILDREN’S PLAY SPACES IN YOUTHIFIED NEIGHBOURHOODS: A CASE STUDY OF PORTLAND AND NEW YORK

Abstract ID: 959

Individual Paper Submission

SHADKAM, Anahita [University of Waterloo] annahita.shadkam@gmail.com, presenting author
MOOS, Markus [University of Waterloo] markus.moos@uwaterloo.ca, co-author

The purpose of this research is to examine availability of parks and playgrounds and their functionality within the larger network of public open spaces at the neighbourhood scale. The focus is on the availability and connectivity of children’s play spaces in youthified neighborhoods, which are compact inner-city neighborhoods mostly occupied by young adults (Moos 2016).

Previous research demonstrates that despite provision of parks and playgrounds in inner-city neighbourhoods, children are still segregated from urban experience mostly due to their parents’ residential location decisions, and the perceived social and environmental risks of children’s play in urban settings (Veitch et al. 2007; Woolley 2008). Thus, while an important factor in determining usage, proximity to existing parks and playgrounds does not necessarily correspond to children’s usage of public open spaces or parents’ willingness to reside in urban settings.

More research is required to identify factors influencing the use of parks and playgrounds within specific neighbourhoods. Parks and playgrounds provide a formal setting for children’s play, while “informal play” occurs everywhere in the city (De Visscher & Bouverne-De Bie 2008, p. 606). An ideal children-oriented neighborhood model, it has been argued, consists of a network of formal and informal play spaces (De Visscher & Bouverne-De Bie 2008).

Therefore, the main question we ask is “how well are parks and playgrounds connected to the larger network of public spaces”? and “what are the connectivity factors to be considered by planners in provision of future play spaces in urban settings”?

In order to study how well parks and playgrounds are connected to the broader network of public spaces, we selected three youthified neighbourhoods with different urban layouts in North America: Elliot and Lloyd (two adjacent neighbourhoods) in Portland, Oregon and Williamsburg in Brooklyn, New York. These neighbourhoods have experienced rapid influx of young adults (i.e., youthification), however, questions are starting to emerge as to whether these young adults will remain in place as more of them have children. At least in part, whether young adults with children will remain in inner-city neighbourhoods is a function of amenity provisions for children's play. It is often assumed that children do not have as much freedom of play in dense urban environments as they do in suburban areas (Horschelmann & Van Blerk 2013, p. 89-91). This can be one of many drivers of young families' exodus from inner-city neighbourhoods.

We will use distance measurements and what we coin 'connectivity maps' to conduct our analysis. Distance measurement provides data about parks and playgrounds' average proximity to residential buildings and childcare facilities; while connectivity map identifies the paths of public networks (e.g. sidewalks, intersections, streets, etc.) through which parks and playgrounds are connected to other parts of the neighbourhood.

The aim is for the study to inform planning policy that can promote children-oriented neighbourhoods, and help meet Smart Growth goals to retain young adults with children in inner-city neighbourhoods. One could argue that isolation of children into segregated playgrounds is perhaps a sign of planning failure; meaning that dense neighborhoods are developed without effectively considering children's everyday needs for urban exploration and freedom of play in the neighbourhood as a whole. Furthermore, understanding the relationship between children's urban experience and young adults' housing pathways helps planners to predict future patterns of youthification and urban development.

PUBLIC LIBRARY BRANCHES AS COMMUNITY-DRIVEN ORGANIZATIONS: WHAT IT MEANS TO BE OPEN TO ALL AMID NEIGHBORHOOD CHANGE

Abstract ID: 960

Individual Paper Submission

DELGADO, Laura [Massachusetts Institute of Technology] ldelgado@mit.edu, presenting author

We live in a society of organizations, and our ability to get by and get ahead is shaped by our access to organizations and the relationships and resources to which they connect us. For those who are low-income, unemployed, disabled, or homeless, organizations play an even more critical role in shaping access to opportunity. When neighborhoods gentrify, these are also the populations who are most at risk of becoming marginalized within their own communities. Gentrification can lead to improvements in public amenities and organizations; however, low-income community members may fail to benefit from these community investments when they feel that the improvements are not intended for them. Furthermore, non-profit organizations that target services to these vulnerable populations may experience displacement pressure as the neighborhood gentrifies. How local organizations adapt and respond to external pressures associated with gentrification affects whether vulnerable populations are able to access resources and to what extent they feel comfortable doing

so. This research examines one type of local organization, the public library branch, in the context of gentrification. It asks, as neighborhoods gentrify, how do public library branches adapt to neighborhood change, and to what extent do they continue to provide services for low-income populations?

Scholars have addressed how local organizations adapt to neighborhood change; however, they have focused on organizations that serve a subset of the local community, be it based on religion, race or ethnicity, income, or age and familial status. Public libraries offer a new and unique lens through which to examine neighborhood change because they are community-driven organizations that are accessible to all, regardless of age, income, race, ethnicity, religion, ability, immigration status, employment status, familial status, or other ascriptive or socioeconomic characteristics. As public institutions, they have an important tradition of welcoming and serving vulnerable populations, such as immigrants and the poor. They also, however, are cultural institutions that provide services of interest to gentrifiers, such as author talks and art exhibits. As neighborhoods change, public library branches are faced with the option to continue serving those who are most in need or to adapt services, resources, spaces, and outreach to new community needs.

This research uses a mixed-method study of twenty-five public library branches in Boston, Massachusetts, to study how these local organizations have adapted to gentrification over the last decade. Findings are informed by a combination of interviews, participant observation, archival research, and analysis of branch-level data. This research contributes to planning literature on gentrification and social inclusion. It also focuses on a subject largely overlooked by planners: the social, cultural, and economic role of public library branches in neighborhoods. With services for the homeless, job search assistance, classes for immigrants, and many other services and programs of interest to planners, public libraries are becoming an increasingly important part of the social safety net in cities and beyond.

"THAT'S SO REZ": UNDERSTANDING THE ROLE OF EVALUATION IN CANADA'S ON-RESERVE HOUSING SYSTEM

Abstract ID: 981

Individual Paper Submission

MCCARTNEY, Shelagh [Ryerson University] shelagh.mccartney@ryerson.ca, presenting author

Poor housing contributes to the ongoing systemic marginalization of First Nations peoples in Canada. As a variety of fields begin to recognize and address health and well-being outcome gaps faced by First Nations, housing inadequacy and inappropriateness are understood as causes. Current housing systems- processes, designs, implementations strategies and outcomes- are mediated by national-level colonial policies and evaluations removing control from individual First Nations. The objectives of this paper are to uncover, and test through partnership with two First Nations alternative frameworks focused on lived experiences, preferences and priorities to create well-being, through the following objectives:

1. Understanding how Indigenous knowledge systems, values and cultural practices could be implemented in housing systems;
2. An assessment of existing evaluation metrics and whether these are inclusive of Indigenous ways of knowing;
3. Creation of local evaluation metrics with two First Nations; and
4. Review of gaps between existing and alternative evaluation methods and their effect on the design, governance and management of housing programs.

Methodology

Housing systems in Canada are examined to understand the development of existing and historical evaluation strategies. A review of housing assessment tools is conducted in grey and academic literature, first within Canada and then globally, with a focus on Indigenous peoples. Evaluations are coded thematically (motive for evaluation, evaluator, flexibility of data collection tool, data ownership, etc..) and grouped to understand existing variation and innovation within the field.

Housing policy is contrasted with Indigenous knowledge systems; building on the work of Indigenous planning, gaps between practice and theory are explored isolating potential for localized, community-developed tools. An immersive and participatory process is undertaken with two First Nations. Working from an assembled database of potential metrics communities created their own housing evaluation frameworks. Local evaluation findings were contrasted with Core Housing Need to understand the implications on well-being and the built environment.

Findings

Existing housing policy and evaluation strategies in Canada developed in response to growing urban- and suburbanization. Core Housing Need, Canada's nationally-applied housing evaluation strategy, was built to reflect changing understandings of minimally acceptable housing in southern Canada. Mirroring rapid suburbanization in the south, housing designs, policies and evaluations were imposed on First Nations ignorant of climate, geography and culture.

Occupant-based processes are being implemented in other post-colonial settings recognizing housing satisfaction and cultural safety as critical elements of sustainable communities. The two case studies test these alternatives to understand First Nations experiences with housing- beyond the physical realm to the currently unmeasured effect on community well-being. Local understandings of crowding, family arrangements, safety and spatial needs yield design implications reshaping existing housing systems and offering a pathway towards the decolonization of home.

Relevance

This project identifies gaps between existing evaluation systems and community-developed, occupant-focused housing evaluation in First Nations. Building on Indigenous planning theory, this work brings the concept of decolonizing planning processes to the scale of house/home to create equity in the lived environment. Housing shifts from a site of assimilation to one of cultural regeneration, unlocking the emancipatory potential of planning through the recognition of the unique contexts and cultures in First Nations

A SPATIAL HEDONIC ANALYSIS OF A SHRINKING LAKE MEAD

Abstract ID: 989

Individual Paper Submission

SINGH, Amrita [University of Alberta] amrita4@ualberta.ca, presenting author

SAPHORES, Jean-Daniel [University of California, Irvine] saphores@uci.edu, co-author

Persistent arid conditions and population growth in the Southwest have taken a toll on the Colorado River. This has led to substantial drawdowns of many water reservoirs around the Southwest, and especially of Lake Mead, which is Las Vegas' main source of drinking water. Due to its importance, Lake Mead has received a great deal of media attention about its "bathtub ring" and the exposure of rock that used to be underwater. Drops in water levels have caused some local marinas to close, thereby affecting the aesthetic and recreational value of Lake Mead, which is located in the country's largest National Recreation Area (NRA), and surrounded by protected land.

Although a rich literature analyzes how water quality impacts real estate values, relatively few studies have examined how dropping water levels are capitalized in surrounding residential properties (Landsford and Jones, 1995; Loomis and Feldman, 2003). In this context, the goal of this study is to quantify how Lake Mead's water level changes are reflected in local property values. Since Lake Mead is the primary attraction within its recreation area, we are also concerned with how this recreation area, which is a few miles southeast of Las Vegas, is capitalized in the Las Vegas metropolitan area's (LVMA) residential property values, as few valuation studies have examined how proximity to national parks influences these values (Gibbons, Murato, Resende, 2014; Peason, Tisdell, Lisle, 2002).

Because the LVMA is home to more than two million residents, and subsequently a geographically large housing market, we hypothesize that the effect of proximity to the NRA and changing water levels in Lake Mead vary over space. Thereby suggesting that a global model for this very large region may be inappropriate. Therefore, another goal of this study is to uncover how the valuation of both park access and water level varies throughout the LVMA region

To delineate the effect on housing values we will estimate several regression models using single family sales from 2015 to 2017 within 10 miles of an entry point to Lake Mead. In each model, sales price is a function of our primary independent variables: proximity to the Lake Mead NRA and Lake Mead's water levels, as well as common structural characteristics, fixed effects to account for unobserved locally constant characteristics and temporal variation, and specific variables such as distance to the Las Vegas Strip and downtown casinos. We first estimate two global models: (1) standard hedonic model and (2) A spatial hedonic model that accounts for spatial autocorrelation from surrounding property values (SARAR). To guard against biased and inconsistent estimates resulting from heteroskedasticity, we estimate this models using generalized spatial two-stage least squares (GS2SLS) (Arraiz et al., 2010). Finally, we estimate a third local linear regression model: (3) A geographically weighted regression (GWR) that demonstrates how the valuation of water levels and proximity to the NRA varies throughout the LVMA residential sales market.

Preliminary findings show that both local and global results suggest that homes farther from the strip have higher selling prices than homes located closer to the strip. While the local model indicates that proximity to the NRA entry point is positively capitalized in single family residential homes within four miles. The local model also reveals that falling water levels in Lake Mead are negatively capitalized in a single community, Sunrise Manor, which contains residential sales closest to Lake Mead.

This study will contribute to hedonic studies in two ways. It will estimate the economic value of a national park and falling water levels in Lake Mead. Second it quantifies how this value changes throughout the LVMA region.

ATTACHED TO PLACE OR BONDED TO PEOPLE: EVIDENCE FROM THE WESTPARK HOPE VI EVALUATION

Abstract ID: 996

Individual Paper Submission

PARK, Kiduk [The Ohio State University] park.1557@osu.edu, presenting author

With the relocation experience, research found that HOPV VI relocatees lose their social ties from their attached community at their former public housing (Curley 2010; Manzo, 2014). Although research has emphasized the role of social ties and attachment to public housing areas which influence the outcomes at their destination neighborhoods (Goetz 2010, 2013; Kleit & Manzo, 2006; Oakley et al., 2013; Manzo et al., 2008;), it has paid less attention to the difference between those two subjective, cognitive and affective factors. Although their causality has not been established, empirical studies using multivariate analysis found a strong relationship between place attachment and social ties for low-income households (Kleinhans, Priemus, & Engbersen, 2007; Livingston, Bailey, & Kearns, 2008). Another study suggests the positive relationship between place attachment and residential satisfaction may affect residents' outcomes such as their capabilities and adaptation level (Choi, Park, & Lee, 2016). In addition, more social interaction and social ties brings about higher levels of residential satisfaction (Amérigo & Aragonés, 1997; Andersen, 2008; Dekker & Bolt, 2005). To investigate the role of residential satisfaction in the context of revitalization program, this study explores how residential satisfaction is affected by the relationship between social ties or place attachment during the displacement process. Using two waves of survey (pre and post-move) with three time points (retrospective, pre-, and post-move) of the Bremerton Wahsington's Westpark project, this study investigates the casual relationships through the framework of a causal model. Expected results from longitudinal SEM analyses would demonstrate that forming new social ties was associated negatively with place attachment at pubic housing as relocatees moved into a new neighborhood. Place attachment, which functioned as a mediating variable, would be associated with higher residential satisfaction after creating social ties at new residential settings. Therefore, these findings emphasize the importance of place attachment as a possible mediator between social ties and residential satisfaction.

BUILDING CIVIC CAPACITY IN THE FACE OF DECLINE: THE EFFECT OF STATE POLICY ON LAND BANKS

Abstract ID: 1008

Individual Paper Submission

WEST, John [Ball State University] jhwest@bsu.edu, presenting author

The term civic capacity was coined by political scientist and urban scholar Clarence N. Stone (2001). It describes conditions in which “various sectors of a community come together to solve a particular problem” (Stone et al. 2001). In shrinking cities and towns, civic capacity can be frayed, or strengthened, with key organizations making the difference (Dieterich-Ward 2016, Safford, 2009). This study posits state policy may enable or inhibit declining places to build new civic capacity. This proposition is examined by using land bank formation and operation as an example resilience in the face of decline. To study this proposition, I analyze state land banking legislation, paying particular attention to funding and property acquisition mechanisms. I then categorize more than 170 land banks according to the legislative context in which they operate. Next, gathering basic information on all land banks and conducting detailed case studies at two initial cities, this study examines whether strong state enabling legislation has led to more effective land banks. Initial findings suggest the state policy is mediated by two factors: the presence of civic institutions (philanthropies, community-based organizations, corporate headquarters, hospitals, universities, etc) and the geographic pattern and extent of economic decline in local property markets.

BEYOND GENTRIFICATION DICHOTOMIES: NEWCOMER'S AND OLD TIMERS' PERCEPTIONS OF NEIGHBORHOOD CHANGES AND COMMITMENTS TO CHANGING THE NEIGHBORHOOD

Abstract ID: 1014

Individual Paper Submission

GOLDMAN, Laurie [Tufts University] laurie.goldman@tufts.edu, presenting author

The perspectives and interests of long-term residents and newcomers to gentrifying communities are typically construed as dichotomous and conflicting. Studies tend to examine the effects of the influx of more affluent, educated, and mostly white residents on the physical, economic, social, and political displacement of lower-income, less educated, and more racially and ethnically diverse old-timers. Observations that some newcomers use their influence over planning decisions to curtail displacement counter this sharp dichotomy between newcomer and old timer interests (e.g. Brown-Saracino 2009).

We know less about how newcomers' dedication to preserving their vision of the community's authenticity is aligned with longer-term residents' perceptions of neighborhood changes and their priorities for planning and

development. Nor is the potential for advocacy coalitions that unite residents with different prospects for benefiting from development well understood.

This paper draws on participatory action research in Somerville, Massachusetts – a historically working-class city of immigrants undergoing gentrification in anticipation of transit-oriented development – to provide a more nuanced understanding of residents’ responses to neighborhood change. It compares and contrasts residents’ perceptions of recent changes, their priorities for future development, and their participation in planning and protests with respect to a range of demographic characteristics and along a continuum of length of residence in the community. It also examines the ways in which these commonalities and differences have influenced coalition building and advocacy for development without displacement.

Two primary data sources inform the study. A survey designed with input from residents was administered by resident teams in two phases: in door-to-door interviews in two neighborhoods targeted for development in the new transit corridor (N=80) and at gatherings of participants in four service delivery and community organizing programs (N=67). Three years of participant observation of two neighborhood coalitions’ meetings, city-led planning meetings and design charrettes, and public hearings about permitting and zoning elucidate the variation in civic engagement among sub-groups and the nature of interactions among them. Stakeholder interviews and local media accounts supplement these observations.

Findings suggest that perceptions of whether the neighborhood is changing for the better or for the worse are more similar than interest-based analysis would predict, despite significant differences in financial stress and housing conditions. Life-cycle factors account for somewhat more of the variation in perceptions of change than do length of residence, housing tenure, race and ethnicity, and other socio-economic factors.

Although reported participation in a range of civic engagement activities is positively correlated with income and education, virtually all survey respondents expressed optimism that collective action can benefit all residents. Countering assumptions about the inevitability of political displacement, more people of color and lower-income residents were involved in collective action in the “high-gentrifying” neighborhood where housing costs are rising faster and anti-displacement organizing has been more extensive than in the neighborhood where gentrification is progressing more slowly. Indeed, residents who are most vulnerable to displacement have assumed leadership roles in local coalitions, city-appointed committees, and the elected city council along-side their newer neighbors, often supplanting (mostly white) old timers. Nevertheless, barriers to engagement mean that white, more affluent, and highly educated newcomers tend to be over-represented in forums that promote housing affordability and job creation.

Findings suggest that research should employ multi-factor categorizations of residents to analyze experiences and impacts of gentrification and devote more attention to variation across household, neighborhood, and city-wide levels of action and analysis. The paper raises directions for further research about how service-providing organizations and community organizers influence residents’ engagement in neighborhood change.

"IT'S NOT MUCH, BUT AT LEAST IT'S AFFORDABLE: AN ANALYSIS OF THE IMPACT THAT LIVING IN SUPPLY CONSTRAINED MARKETS HAS ON HOUSING CONSUMPTION."

Abstract ID: 1017

Individual Paper Submission

KUHLMANN, Daniel [Cornell University] dok23@cornell.edu, presenting author

By driving up prices, constraints on new residential develop limit the options available to families as they search for housing. Faced with high housing prices and fewer choices, families alter their housing consumption in many ways—some spend more of their income on housing expenses, while others choose to purchase or rent homes farther away from employment opportunities or in underserved neighborhoods. In this paper, I examine whether families in supply-constrained places also respond to high housing prices by changing the physical characteristics of housing they consume.

To test this question, I use data from two (2011 and 2013) metropolitan samples of the American Housing Survey to compare the characteristics of housing occupied by families in highly-constrained housing markets to those living in relatively unconstrained places. I find evidence that in constrained markets where housing is very expensive, households are more likely to live in smaller houses, units lacking certain amenities, or those in poor physical condition. I also examine the distributional impact of these distortions. In every city in my sample, low- and very low-income households are substantially more likely to live in units with certain physical problems than are higher-income families, and I identify little difference between families living in constrained and unconstrained markets. But I find that for moderate- and high-income families, living in expensive, constrained places increases their likelihood of occupying worse housing. While there is a large and growing literature that shows how supply constraints alter the neighborhoods in which families live, my study is the first, to my knowledge, that documents an association between supply constraints, housing prices, and the physical attributes of housing families occupy. The findings of my research add to the list of social problems associated with supply-constraints and high housing prices. By improving our understanding of the breadth of problems supply-constraints cause, my study can help inform policy which seek to mitigate their harm.

PLANNING FOR FEAR: UNDERSTANDING RISK AS MOTIVATION FOR COMMUNITY ENGAGEMENT IN INFORMAL SETTLEMENTS.

Abstract ID: 1021

Individual Paper Submission

FURTADO, Lara [University of Massachusetts Amherst] larasfur@gmail.com, presenting author

RENSKI, Henry [University of Massachusetts Amherst] hrenski@umass.edu, co-author

MONTENEGRO-MENEZES, Flavia [University of Massachusetts Amherst] flaviamontm@larp.umass.edu, co-author

After decades of authoritarian planning in Brazil, community engagement is increasingly regarded as a valuable process to improve informal housing conditions. However, it remains a challenge to understand why dwellers chose to participate in any collective activity to strengthen and improve the community (independent of its scale). This may be since those motivations are largely tied to subjective emotional components. Such psychological bonds between people and places has long been studied in Environmental Psychology through the

concept of Place Attachment (PA) and appropriated by multiple fields in empirical and conceptual studies (Riger & Lavrakas, 1981). Thus, I employ PA to identify how both quality of the built space and psychological associations influence dweller's motivations for community engagement in informal communities in Brazil. I will explore tenure risk as a motivation, which has not been broadly explored in studies of PA. Engagement is often presented in PA literature as a key positive component based on the premise that people who value an environment tend to be more active in its preservation or improvement (Manzo & Perkins, 2006). However, this study investigates whether negative associations of risk brought by tenure insecurity and government interventions are also drivers of engagement. Specifically, I posed the following questions in the study:

Q.1) Do communities at risk tend to be more engaged?

Q.2) What are their motivations for engagement?

Q.3) What factors and/or stakeholders promote engagement?

I make use of quantitative data and interviews from communities in the city of Fortaleza, Brazil as a representative case study. Fortaleza is the 5th largest city in Brazil and presents about 66% of its population living in informality. Two phases were established for the methodology: 1) Statistical analysis of a dataset that registered the conditions of all 797 informal settlements in the city of (HABITAFOR, 2010); 2) Semi-structured interviews with several key community leaders from diverse informal settlements in Fortaleza. The interviews looked at motivations for citizen engagement, dweller's perceptions of risk and stakeholders that contribute to engagement in three different phases of the settlement: Initial establishment of the community; Consolidation over time and Involvement with government plans.

The preliminary results presented in this paper generally supported the hypothesis indicating that the more community organizations (representative of community engagement), the higher is the probability for intervention with resettlement ($p < 0.05$), for displacing a larger amount of households ($p < 0.001$), for being a smaller settlement (with less than 50hh) ($p < 0.001$) and to be considered a priority for government intervention due to environmental risk ($p < 0.01$). The framework I present points to a disconnect between PA literature which is tied to availability of resources (Lewicka, 2010) and what takes place in the context of shortage of informal settlements.

IMPACT OF CHANGES IN URBAN FORM ON TRAVEL BEHAVIOR: RESULTS FROM A RESIDENTIAL MOVERS' STUDY

Abstract ID: 1030

Individual Paper Submission

ADHIKARI, Binay [University of British Columbia] binay.adhikari@alumni.ubc.ca, presenting author
HONG, Andy [University of British Columbia] andyhong@gmail.com, co-author
FRANK, Lawrence [University of British Columbia] lawrence.frank@ubc.ca, co-author

Central theme or hypothesis:

One of the challenges in land use and transportation research is isolating the effect of urban form on travel behavior (Knuiman, et al., 2014; Frank, Saelens, Powell, & Chapman, 2007). Some studies have used residential relocation as a way to isolate the causal effect urban form on travel behavior (Krizek, 2003; Klinger & Lanzendorf, 2016). However, these studies have not fully accounted for multiple factors that may play a

significant role in affecting travel behavior. Such factors include preference for certain neighborhood types, preference of specific mode of transportation, life events, and past behavior (Van Acker, Wee, & Witlox, 2010). Very few studies have simultaneously accounted for these factors to examine the effects of changes in urban form on travel behavior. This study uses residential relocation as an opportunity to capture the change in neighborhood walkability and regional accessibility and its effects on frequency of auto, transit, and walking trips.

Approach and methodology:

This study uses data from CHANGE (Changes in Health, Activity, and Nutrition across Geographic Environments), a longitudinal study of residential movers in Vancouver, BC, Canada. The participants were recruited for the CHANGE study between April 2012 and August of 2014. Participants were asked to complete a survey, wear an accelerometer for at least eight hours a day for four days, and fill out detailed travel diaries for each trip taken outside of the home during the same four-day period (Time 1). Six months after moving to their new residence, participants were asked to participate in a second, follow-up phase, during which they repeated the same study protocol (Time 2). A parallel “control” sample of households who did not undergo a move was also recruited. Potential control participants were preferentially recruited via a stratified recruitment strategy that sought to match controls to movers based on their socioeconomic and demographic criteria. Controls followed the same study protocol as the movers, completing identical surveys, and wearing accelerometers and filling out the travel diaries during the same four-day period. The study used a first differencing method of panel analysis, which uses change scores of urban form (ΔX , between Time 1 and Time 2) and other covariates (ΔZ) to predict changes in trip frequency (ΔY).

Findings:

The preliminary results show that changes in neighborhood walkability have a significant positive effect on walking trips, but only for home based non-work trips. We did not find a significant effect of the change in neighborhood walkability on transit and auto trips. Changes in regional accessibility were also not found to have any significant effect on trip frequencies. The final results of our analysis will shed light on the causal effect of the change in urban form on the travel behavior while accounting for other important confounders.

Relevance to planning scholarship, practice, or education:

The results from this study provide causal evidence on the effect of change in urban form on travel behavior. In addition, this study will also provide information on the role of residential and travel preferences, life events, and past behaviors affecting travel behavior.

EMERGING STRATEGIES FOR INTEGRATING HEALTH AND HOUSING

Abstract ID: 1050

Individual Paper Submission

SCALLY, Corianne [The Urban Institute] cscally@urban.org, presenting author
WAXMAN, Elaine [The Urban Institute] ewaxman@urban.org, co-author
GOUREVITCH, Ruth [The Urban Institute] rgourevitch@urban.org, co-author

For decades, housing professionals, public health officials, and city leaders have recognized the link between people's homes and their health and well-being. Residents of substandard housing may face health hazards such as toxic lead paint or mold, and the struggle to cover housing expenses may contribute to chronic stress and reduce resources available for other basic needs such as an adequate diet or access to health care. The housing sector has historically led the charge to create healthy homes and living environments, focusing on improving affordability and housing quality, and forging connections with health services. Only recently, with increased attention on the social determinants of health, have health care leaders embraced interventions that address non-health factors such as housing.

In this study, we identify and study emerging interventions that integrate housing and health services for low-income populations, where the health sector has been a leader to: 1) align health services and housing in one place, 2) optimize health sector investments in housing; or, 3) use housing and community development policies to promote health. We conducted over 30 interviews with national experts, including non-profit housing and health providers, foundations, health payers, environmental health leaders, and community developers. We asked them about new strategies or practices that met our criteria, and what they knew about these in terms of partners, funding, opportunities, and challenges. Next, we selected six case studies that represented a diverse group of strategies, partners, and geographies covered. We interviewed over 50 partner staff members, including leadership of partnering housing and health organizations, funders, local government stakeholders, and community health workers. We asked about: what motivated them to get involved, activities/strategies used, their partners, funding, community engagement, data and evaluation, and policy environments.

Our case studies ranged from those targeting health and housing interventions within a single building, to a single neighborhood, to an entire city, and finally to a national strategy to engage local partners in an array of interventions. The Conway Center in Washington, DC is the only intervention that is not up and running yet. This partnership is between a FQHC and a nonprofit housing developer and employment training center to co-locate new housing, clinic, and employment training center in a single building. The Healthy Neighborhood Healthy Families program of Nationwide Children's Hospital and Community Development for All People took a block by block approach to turn around distressed housing and vacant lots in a Columbus, Ohio neighborhood. The Vita Health and Wellness District in Stamford, Connecticut leveraged public housing revitalization and expansion of the Stamford Hospital to achievement broader community health goals. A citywide partnership between the Boston Housing Authority, the Boston Public Health Commission and local universities, has elevated the profile of housing's effect on population health, and nurtured a number of programs to promote housing as health. In Austin, Texas, Foundation Communities has worked with St. David's Foundation and a variety of local partners to bring health education and services to residents of their 19 affordable housing properties. Finally, UnitedHealthcare has worked at the national level to identify ways to partner with local organizations to better locate and serve their Medicaid members through a number of different strategies.

We found five common themes across all six diverse cases that are relevant to other groups considering these types of partnerships: 1) allies are everywhere, 2) both public and private funding sources are essential, 3) community residents are an asset to the work, 4) data integration is difficult, but essential, and 5) measurement matters, but is lagging. We provide some suggestions for overcoming challenges in establishing new health and housing partnerships.

THE IMPACT OF HOUSING AGE ON RESIDENTIAL MOBILITY: EMPIRICAL EVIDENCES FROM THE 100 US METROPOLITAN AREAS, 2000 TO 2012

Abstract ID: 1058

Individual Paper Submission

LEE, SEONGWOO [Seoul National University] seonglee@snu.ac.kr, presenting author
LEE, HYUNKYUNG [Seoul National University] buldol1209@snu.ac.kr, co-author

The main objective of this paper is to investigate how much of the apparent inter-metropolitan variation in mobility rates is due to the age of the housing stock available to in-movers. There is a common belief that the collective effect of housing on life cycles of individuals and households is pervasive and cumulative. However, existing research on residential mobility is deficient in relation to the spatiality of detailed housing characteristics. The sharply uneven patterns of residential mobility in the US constitute an important dimension of diverse housing market dynamics. This is particularly true if we consider housing market disparities before and after the financial crisis and the subsequent recession in the US. It is clear that residential mobility is dependent not only on one's life-cycle stage and economic circumstances in countries but also on the nature of each metropolitan area's housing market condition, which may constrain individual behavior.

While previous studies have emphasized the role of individual characteristics, the present analysis investigates the influence of housing age and metropolitan housing market conditions in constraining local mobility. Research needs to be comprehensive enough to understand the complex interaction between an individual's moving propensity and metropolitan housing market dynamics. This paper presents a multi-level analysis of factors explaining residential mobility. We adopt the Public Use Microdata Sample (PUMS) from the 2000 census, and the 2007 and 2012 American Community Survey (ACS) for our analysis. This study has extracted data for the 100 largest metropolitan areas in the US. Substantial differences are found to exist across both types of households and metropolitan areas in the likelihood that households have recently changed address.

Age of housing unit is found to make a substantial contribution to explaining inter-metropolitan differences in mobility rates. In models combining owners and renters, introduction of housing age lowers metropolitan variance by about 30–60%, dependent upon the three different cross-sections. The effect of housing age is highly significant, and strong differences are found across successive vintages. At the individual level, households in older housing have substantially lower recent mobility rates even after controlling for age, tenure, income, migration status, and other household- and metropolitan-level factors. We also find that housing market characteristics show some heterogeneous effects on household moving propensity by tenure.

The posited explanation for the housing age effect is that older units progressively contain increasingly settled occupants, which results in fewer opportunities for in-movers in metropolitan housing markets with older housing. This study suspects that older housings may suppress the mobility of residents by creating an environment where relatively few vacancies are generated and opportunities for moving are reduced. It is likely that areas that have older dwelling stocks are more established and are less likely to exhibit high turnover rates and generate fewer vacancies. In other words, households in older housing have a lower likelihood of recent mobility, even after controlling for such comprehensive mobility determinants as diverse demographic and socio-economic household characteristics, housing, and housing market characteristics. This study concludes that housing age can explain substantial part of the variation of the observed inter-metropolitan differences in mobility rates of households that have long puzzled researchers.

JOBS, AMENITIES, OR HOUSING? THE ROLE OF HOUSING AFFORDABILITY IN INTER-CITY LOCATION CHOICES OF URBAN MIGRANTS

Abstract ID: 1078

Individual Paper Submission

HU, Wanyang [University of California, Los Angeles] wanyang@g.ucla.edu, presenting author

There have been many debates in urban economics on the relative importance of jobs and amenities in labor's inter-city location choices and urban population dynamics. (Glaeser 2008) By contrast, the role of housing affordability in inter-city migration has received much less attentions, despite its recognized importance in intra-city residential location choices. (Plantinga et al 2013) It has been argued that housing costs play a less important role in long-distance migration compared with job opportunities and amenities. (Greenwood 2014) Nevertheless, research shows housing affordability has been playing a rising role in inter-state migration in the U.S. since late 1970s. (Sasser 2010) Similarly, in China, soaring housing price and the resultant housing affordability crisis have driven many young professionals to leave the top-tier cities and have acted as binding constraints in migrants' location choices, especially in big cities that are destinations of most urban migrants.

A few studies that have explicitly investigated the role of housing affordability in inter-city migration choices have produced quite mixed results. (d'Albis et al 2017; Sasser 2010) Relying on aggregate migration flow and measures of housing costs or instrument variables, these studies either suffer from endogeneity issue or ignore the fact that migrants select cities based on their individual-specific expected housing costs instead of average housing costs. Recent research using discrete choice model and micro-data could circumvent these issues. However, most of these studies either focus on intra-city location choices or the first two stages of inter-city migration decisions, i.e., the decision of whether to move and where to move. (Plantinga et al. 2013) Nevertheless, location choice research without considering migrants' settlement intentions will be less informative to understand long-term urban population dynamics if many of the migrants will ultimately return to origin cities or move to other cities, since only migrants who permanently settle down in destination cities could ultimately translate into long-term urban population growth. Extant research also implicitly assumes the independency between migrants' choices of destination cities and settlement, and separately models these two decisions, while ignoring the fact that some migrants, such as circulating migrants, may have pre-determined settlement intentions prior to migration, and then select destination cities accordingly. (Hugo 2013) Ignoring the inter-dependency between these two decisions has imposed strong behavioral assumptions, producing biased estimates and misleading conclusions on the relative importance of different migration drivers.

To fill these gaps, this research examines the role of housing affordability in migrants' joint decisions of destination cities and settlement. We also explore how migrants with latent heterogeneous choice patterns respond differently to housing affordability in potential destinations. Using individual data from the National Migrant Population Survey in China, we develop a two-stage latent class conditional logit model to jointly depict migrants' decisions of selecting and settling in destination cities. This method allows for latent heterogeneities in individual location preferences and utility dependencies in multi-stage choices. Preliminary results indicate that housing costs play an important role in migrants' decisions of destination cities and settlement. However, migrants with pre-determined settlement decisions prior to migration tend to be less sensitive to housing costs, expected income and other amenities in destination cities. These urban migrants may include circulating migrants, migrants who move due to family reasons, etc.

This research extends current understandings on the relative importance of housing affordability in migrants' inter-city location choices and their settlement propensities in destination cities while accounting for the inter-dependency between these two decisions. Moreover, it reveals that migrants with latent heterogeneous location choice patterns respond differently to housing costs and other urban characteristics, which is particularly important to understand long-term urban population dynamics given the circulating nature of many cross-city migrants.

THE IMPACT OF CHICAGO'S \$1 LARGE LOT PROGRAM ON CRIME AND WEALTH-BUILDING

Abstract ID: 1081

Individual Paper Submission

STERN, Matthew [University of North Carolina] mattcp@live.unc.edu, presenting author

LESTER, Bill [University of North Carolina] twlester@unc.edu, co-author

Nationwide, as cities struggle with urban shrinkage and spatially-defined hazard vulnerability, urban land vacancy has become an increasingly important issue. To counteract this trend, generate revenue, and encourage development of vacant parcels, cities often seek to sell property via methods including auctions and land banks. Some cities are experimenting with side-yard and same-block lot sale programs, in which property owners are eligible to purchase nearby parcels at discounted rates. Recently, building on similar programs in St. Louis and New Orleans, the City of Chicago began offering some of its 13,000 city-owned properties—many obtained through tax foreclosures—for \$1 to same-block property owners. This 'Large Lots Program' seeks not only to return properties to the tax rolls but to increase safety, generate wealth, and foster neighborhood control of development and land use.

Although scholarship exists on land-banking and urban shrinkage (Dewar 2006, 2015; Mallach 2017), as well as the impact of urban vacancy on neighborhood health (Frazier et al. 2013), few studies have looked at the success of side-lot and same-block programs in particular (See Ganning and Tighe 2015). We investigate two Large Lots pilot programs in Chicago, through which 453 out of an available 4,500 lots were sold to local landowners in two economically distressed neighborhoods on the South and West sides. Specifically we test whether lot sales are associated with a reduction in crime on the same block and in surrounding areas. Utilizing publicly available data from the City of Chicago and the Chicago Metropolitan Agency for Planning, we perform a block-level analysis of the impact of large-lot sales on crime trends and compare changes in crime from before the program was announced to after sales were completed. Blocks with successful sales are compared to a set of statistical control blocks in the same neighborhood. Preliminary results suggest that blocks where citizens participated in the Large-Lot program had a small, but significant reduction in overall crime rates.

In addition to analyzing the impact of the Large-Lot program on neighborhood safety, we also examine the potential wealth generation affects for residents of low-income communities that may occur through a simulation of the full implementation of the program in targeted neighborhoods using a parcel-based projection of land value changes in Chicago.

Urban vacancy axiomatically occurs where property values are low. In the case of Chicago, the greatest concentration of city-owned land is located in neighborhoods defined by urban renewal and decades of disinvestment. While the city's goal of returning property to the tax rolls reflects a general desire to encourage growth and productive use, the program's other stated goals indicate a political and moral imperative for this program: to build wealth, reduce crime, and increase local agency over processes of neighborhood change. The Large Lots program seeks to generate community-driven investment and, as a result, neighborhood health. In this paper, we evaluate indicators of the program's initial success.

THE IMPACT OF AIR POLLUTION ON HOUSING PRICES

Abstract ID: 1085

Individual Paper Submission

JIN, Tony [Texas Southern University] tonyjintsu@gmail.com, presenting author

This study evaluates the impact of air pollution on housing prices, and estimates the residents' willingness to pay (WTP) for clean air. Under the equilibrium market assumption, people are treated as rational individuals who make decisions based on market prices. Utilizing hedonic price model, air pollution can be measured as one of many property amendments to estimate its implicit market value. Therefore, it helps us to understand how air pollution could affect the residential relocation decision making. Houston is the fourth largest metropolitan area with vast volumes of daily traffic, and also has a top national petroleum refinery industrial at the Gulf Coast region. Both industrial and traffic emission contribute to the degradation of regional air quality. Even though a few studies have addressed the air pollution concerns in this region, we have found no study evaluates its impact on housing prices. In the southern Texas, the city experiences relatively high temperatures over the year than most other cities do, it results in high level of Ozone concentration in the metropolitan region. This study tends to reveal how much the Ozone level would impact housing prices within the Harris County, TX using hedonic price model. And further to estimate the local residents' willingness to pay (WTP). This study acquires air pollution (Ozone) data from Texas Commission of Environmental Quality (TCEQ), housing data from both Harris County Appraisal District (HCAD) and Houston-Galveston Area Council (HGAC), and demographics data from the US Census. Ground level ozone concentrations are measured following the NAAQS. Besides of property structure amendments, economic demographic characters will also be included to further assess the impact of Ozone on low-income communities. The findings can help us better understand the potential effects of environmental degradation on housing demand, it's especially important to those living in low-income neighborhoods.

HOLISTIC MODELING OF POST-DISASTER HOUSING RECOVERY

Abstract ID: 1097

Individual Paper Submission

HAMIDEH, Sara [Iowa State University] shamideh@iastate.edu, presenting author

“Housing recovery is the second disaster”. This is one of the notions that stands out to me when interviewing local stakeholders after disasters. This notion exemplifies how important and how difficult housing is in the overall recovery of a community. Housing recovery is often characterized as a long-term and unequal process largely driven by markets and sometimes supported by government assistance. Slower recovery for vulnerable populations widens the pre-disaster gaps not only with respect to housing but also economic and health conditions, making housing one of the major areas the disaster community can target for reducing disparities through planning. Inequalities in housing recovery could be addressed more effectively if we better understood its patterns and the interconnected factors that shape them. To better understand what factors to change to reduce disparities, we should move beyond single case study events and develop longitudinal datasets that include household level data on recovery resources such as insurance, grants, and loans from government sources and social networks. I will share findings from a research project that links households' socioeconomic features with tax assessments, building permits, and recovery assistance information across multiple events over multiple years to model recovery more accurately and inform planning more effectively.

ADVANCING ACCESS TO OPPORTUNITY: HOW MUCH REGIONALISM DO FRONT RANGE METRO AREAS NEED?

Abstract ID: 1111

PENDALL, Rolf [Urban Institute] rpendall@urban.org, presenting author

As planners and advocates in the U.S. work to increase access to opportunity, they often feel thwarted by the parochialism of small local governments in fragmented regions. Various scholars have tracked regional efforts to address concentrated poverty, segregation, and place-based inequality, but the field remains divided between cautious optimism and pessimism (Bollens 2002, Chapple and Goetz 2011, Lester and Reckhow 2013).

Local governments arguably have had a responsibility to promote equal access to residential opportunity at least since passage of the Fair Housing Act of 1968. After decades of obstruction and tepid commitment by federal and local governments, the Obama Administration finalized in 2015 a new rule on this so-called Affirmatively Furthering Fair Housing (AFFH) mandate (Silverman, Yin, and Patterson 2017). AFFH, under this rule, obliges entitlement jurisdictions (local governments over a certain size, housing authorities, and state departments of housing and community development) to prepare Assessments of Fair Housing (AFH) in tandem with their periodic consolidated plans. AFHs are meant to spur actions within the consolidated plans as well as more broadly through plans, policies, and investments. To support high-quality AFH preparation, HUD developed a series of neighborhood opportunity indicators, an on-line mapping tool, and a step-by-step guidebook; using these processes, while technically optional, could help protect local governments against legal action under the Fair Housing Act. The Trump Administration has delayed the timeline for implementation of the new rule, but the maps and guidelines remain available, and some entitlement jurisdictions and states remain committed to developing AFHs in the near term.

In many metropolitan areas, the highest- and lowest-opportunity neighborhoods are divided among political jurisdictions; in such areas, the prospect of regional equity is diminished by parochialism in the former and disinvestment in the latter. Notwithstanding these disincentives to collaborate, however, some metropolitan areas, including Denver-Boulder (see <http://denver-aurora-boulderafh.com/>), are taking advantage of the new rule's provision for regional AFHs involving at least some jurisdictions (Leonard 2014).

Since mounting a regional AFH involves political will and transaction costs, it's worth considering how regional an AFH would need to be to make substantial headway in access to opportunity. In this paper, therefore, we will capitalize on HUD's opportunity indicators to assess how access to opportunity varies within and among jurisdictions in the 16 metropolitan statistical areas (MSAs) of Colorado (7), New Mexico (4), Montana (3), and Wyoming (2). We will investigate the geography of two of the six opportunity indices—labor market opportunity and school quality—to learn the following:

- 1. How inequitable is access to opportunity in these MSAs for low-income households and for Latinos? (That is, how does the weighted average neighborhood opportunity score of low-income and Latino people compare with that for upper-income people and Anglos?) If access to opportunity is fairly evenly distributed, then few jurisdictions would presumably be motivated to invest heavily in an action-oriented AFH.
- 2. How regional does the AFH need to be? Are there combinations of small numbers of jurisdictions (and perhaps even single jurisdictions) with the potential to capture a large share of the metro area's variation in access to opportunity? And more specifically, can most of the work of regional AFH be accomplished by collaboration among the largest cities and the counties with the most residents living in unincorporated areas?

The analysis will be limited to literature review and quantitative work relying on the AFFH database and Census data (political boundaries). It will then assess the prospective advantages of various levels of regionalism (none, single city-county partnerships, and multijurisdictional) among these varying metropolitan areas.

MAKING ROOM FOR ALL: CONCEPTUALIZING LONG-TERM NEIGHBORHOOD DIVERSITY IN AN AGE OF MASS MIGRATION

Abstract ID: 1126

Individual Paper Submission

COMANDON, Andre [UCLA Luskin School of Public Affairs] acomandon@ucla.edu, presenting author

Since the repeal of racist immigration quotas in 1965, an increasing number of large metropolitan areas have become ethno-racially plural and many of their neighborhoods have become mixed. In Los Angeles, according to Bader and Warkentien (2016), a fifth of all tracts are stable diverse neighborhoods. These are neighborhoods where all major racial and ethnic groups are represented and show no signs of transitioning from one dominant group to another.

This, however, does not mark the end of segregation. In this paper, I examine how the influx of international migrants has changed our conception of segregation through an analysis of the most diverse neighborhoods of Los Angeles, a region that has been highly diverse for decades. Such spaces hold the potential to reveal unique insights into new forms of exclusion that do not rely on the spatial segregation that dominated United States cities until the 1980s (Ellen, 2000). As an initial step in a broader research agenda, I ask whether there is a definition of diversity that can be applied generally across time and metropolitan contexts, but also that carries meaning beyond the description of spatial structure.

There is no proscribed ideal for either the scale or level of diversity (Ellickson, 2006). As such, a neighborhood may be diverse at the block level yet retain clear separations if people do not share public spaces and local amenities. In contrast, at larger scales, diversity may be more meaningful if a cluster of homogeneous areas have to share spaces such that homogeneity quickly dissolve when people leave their home. I address these contending conceptualizations by developing a flexible approach to neighborhood change and build on existing research to insure the measure captures processes that are useful for further analysis.

I use block-level census data for Los Angeles County from 1970 to 2016 to trace the evolution of areas. This enables a spatial analysis that accounts for changes in neighboring units at scales ranging from the tract to meaningful political units. I also use Public Use Microdata Samples going back to 1970 to track metropolitan-level shifts in the incoming and outgoing populations that serve to contextualize small scale changes. Questions of displacement are central to conceptualization of neighborhood diversity and placing small scale changes against larger scale trends can help better understand the processes at work (Zuk et al., 2015).

Diverse areas cannot be easily classified. I show that in a context of large scale changes in the socioeconomic composition of the region, long term diversity, while stable within larger areas changes significantly at smaller scales. Trajectories range from displacement to integrative processes. I begin to disentangle factors influencing these differences with a multinomial logit regression. Factors, such as housing stock, emerge as highly relevant but need further research to establish the mechanism underlying the process. This analysis moves us closer to a definition of diversity that serves to undercut the effect of segregation.

HOMES CHANGING HANDS: PATTERNS OF OWNERSHIP FOLLOWING FORECLOSURE FILINGS, TOLEDO, OHIO

Abstract ID: 1129

Individual Paper Submission

HAMMEL, Daniel J. [University of Toledo] dan.hammel@utoledo.edu, co-author
SHETTY, Sujata [University of Toledo] sujata.shetty@utoledo.edu, presenting author

Previous research on the mortgage foreclosure process in Toledo and Lucas County, Ohio, has shown that between 2004 and 2008, when the foreclosure crisis was at its peak in the state, a number of basic interventions substantially reduced the number of foreclosure filings that eventually resulted in a homeowner losing a home. Among these were, a county-level foreclosure education program, the establishment of a Foreclosure Magistrate's office with the power to send cases to mediation and an aggressive local legal aid community. Still, about 60% of filings ended in owners leaving their homes (Hammel and Shetty, 2013). In this paper, we seek to answer two primary research questions. First, what happened to the ownership of such properties following the homeowners' departure? And second, are there any patterns in the ownership trajectories and locations of these properties that can help guide policy responses?

Since Ohio is a judicial foreclosure state, the foreclosure process generates legal documents at every step, creating several sources of data about individual properties. In general, the complaint, the sheriff's sale, and the confirmation judgment all generate public documents. Data from sources including the Clerk of Courts and the Auditor's Office thus allow us to track the changing ownership of the properties themselves. We take a random sample of homes that entered foreclosure between 2005 and 2009, then follow the legal paperwork associated with each of these properties to see whether they have new resident owners, absentee owners, been returned to banks, been abandoned, become tax delinquent, etc. We are able to map this data. In addition, in order to get a better understanding of the context in which these changes have occurred, we conduct interviews with stakeholders involved in the foreclosure process in the county, including some homeowners forced to leave their homes.

Preliminary findings indicate that foreclosure filings are concentrated within the city and highly focused in a handful of neighborhoods. The suburbanization of foreclosures is not evident. A sheriff's sale on a property indicates a completed foreclosure. Mapping of sheriff's sales indicate a similar spatial pattern of concentration in certain neighborhoods within the city.

The problem of dealing with the large numbers of vacant and abandoned properties resulting from population loss over many decades has only been made more challenging by the recent mortgage crisis. One of the most significant outcomes from a mortgage foreclosure filing resulting in the owner leaving is that the house tends to be abandoned. While the length of abandonment can vary, in areas that have been particularly hard hit, neighborhood stability has also become an issue of significant concern for planners. This research will contribute to our understanding of the processes under way in Toledo and Lucas County over the last few years, in terms of individual properties as well as in terms of neighborhood impacts and provide direction for policy.

GENTRIFICATION NEAR RAIL TRANSIT AREAS: A MICRO-DATA ANALYSIS OF MOVES INTO AND OUT OF LOS ANGELES METRO RAIL STATION AREAS

Abstract ID: 1143

Individual Paper Submission

BURINSKIY, Gene [university of southern california] burinski@usc.edu, presenting author
BOARNET, Marlon [University of Southern California] boarnet@price.usc.edu, co-author
RODNYANSKY, Seva [university of southern california] rodnyans@usc.edu, primary author
BOARNET, Raphael [federal reserve of atlanta] bostic@price.usc.edu, co-author
JAMME, Hue-Tham [university of southern california] jamme@usc.edu, co-author

The issue of neighborhood impacts of new rail transit stations receives considerable attention from both researchers and the press. However, the lack of adequate fine-grained data over time has precluded the formulation of a consensus view. In using a longitudinal data set on California tax filers, we directly track movements across time and thus alleviate ambiguities of previous studies by directly observing whether rail transit station openings displaced lower-income individuals in Los Angeles County, CA.

Prior evidence of displacement due to rail transit station development is mixed. Chapple (2009) examines a cross-sectional dataset to check for links between gentrification and transit in the San Francisco Bay Area from 1990-2000. She shows that over 80% of 102 gentrifying census tracts during the 1990s were within half-mile of a rail or ferry transit station compared to only 40% of neighborhoods experiencing other forms of neighborhood change (Chapple, 2009). Lin (2002) analyzes whether rail station proximity leads to gentrification in Chicago property values between 1975-1991. He finds mixed results and concludes that while the existence of rail transit helps predict gentrification it is highly context- and time-specific. Kahn (2007) measures the extent of gentrification in income, educational attainment, and home prices in 14 of 16 U.S. cities that have built new transit stations since 1970. He finds that receiving a new station did not necessarily gentrify a tract. Stations exhibiting ‘walk and ride’ characteristics did show evidence of gentrification, while ‘park and ride’ type stations did not. Heilmann (2016) looks at income segregation in Dallas neighborhoods by comparing areas treated with a light-rail station and those treated with an unbuilt and/or canceled light-rail station. He finds that new light-rail stations increase income segregation with low-income households leaving high-income neighborhoods at faster speeds. Though unrelated to transit, McKinnish, Walsh, and White (2008) look for displacement from gentrifying census tracts with a sample of households from the 1990 and 2000 Census Long Form survey. They find “no evidence of displacement [of] non-white households” showing instead that lower-educated African-American households disproportionately stay in gentrifying neighborhoods.

We alleviate ambiguities arising above from cross-sectional data and observations at housing-units by tracking directly who moves in and out and where using a unique dataset provided to us through a partnership with the California Franchise Tax Board(FTB). The data contain annual geocoded California income tax information on household residential location and household income levels between 1993 and 2012. We check using a difference-in-difference framework for one dimension of gentrification: the displacement of lower-income

households by higher-income ones. If the in and out flows of high income and low-income households after the opening of a rail-station is such that there is a net outflow of low-income residents then we observe displacement and; hence, gentrification.

To our knowledge, this is the first study to be able to assess displacement with this level of fidelity; thus, potentially providing the clearest evidence of gentrification to date. Additionally, the paper has clear policy implications when it comes informing the planning of rail-transit lines and their proximate environment in relation to housing needs and preferences.

OUTLAW MUNICIPALITIES: THE SRU LAW, SOCIAL HOUSING AND EXCLUSIONARY PRACTICES IN FRANCE

Abstract ID: 1174

Individual Paper Submission

MAAOUI, Magda [Columbia University] mm4964@columbia.edu, presenting author

In December of 2000, the SRU law (Solidarité et Renouvellement Urbain) was passed in France, requiring all municipalities to devote 25% of their housing stock to social housing. Seventeen years later, the balance is striking: still 1,222 municipalities do not comply with this quota. Out of these, 726 municipalities have to pay a fee, based on the Article 55 of this law. This fee represents a total of 77 million euros for 2017, and helps finance rental social housing.

This law represents a place-based shift for a country long characterized by people-based social housing policymaking. Besides, these figures have to be embedded in a national context of increased segregation trends and housing shortage.

The paradox is that social construction housing is progressing, and peaked in the last triennial time period (2014-2016) as almost 190,000 units were built, which means that 106% of initial goals were reached. Yet, a lot of municipalities are still behind. This generates a vivid polemical debate, particularly when the three-year construction results survey are published along with the list of outlaw municipalities. The two regions that concentrate these outlaw municipalities are Provence-Alpes-Côte d'Azur in the South of France, and the Île-de-France region including the capital city of Paris. Not meeting the social housing quota is often correlated with a right-wing political color.

In this paper, we ask what the impact of the SRU fee on changes in social housing stocks for outlaw municipalities is. To answer such a question, we conduct a Difference-in-Differences study (Freeman 2012) that allows us to measure changes in social housing stocks before and after the passing of the law. Our treatment

group comprises municipalities not complying with quota requirements and subject to the Article 55 fee, while our control group consists in the municipalities not complying with quota requirements, but exempt of the fee.

The theoretical framework in which our questioning is embedded revolves around exclusionary practices and institutional marginalization's role in the making of residential neighborhoods. We consider that local agents, such as municipal governments, contribute to reproducing and further structuring segregated neighborhoods, through the construction of the "social housing stigma" (Wacquant 2006) or the "banlieues stigma" (Dikeç 2007). We also consider that French urban policy making is the product of structural logics of "domination mechanisms" (Tissot 2007). Considering such a framework, can the SRU law manage to curb such exclusionary practices?

We hypothesize that change in social housing production will be higher in the treatment group than in the control group. We assume that variables related to change in social housing stock, approximated using the EPLS (Enquête Parc Logement Social), will be associated with or predicted by several key independent variables, including median income, percentage change in population, political color and property values. We consider these as socio-demographic, political and economic factors that might explain municipalities' behavior. Our findings underscore higher increases in municipalities subject to the Article 55 fee versus those that do not pay the fee. For this reason, our paper fills a gap in the literature by making use of newly released data and by casting a new light on how a Difference-in-Differences model can help us answer our question.

The planning implications of this study are timely, given that in 2017, the government has been examining multiple ways to make the SRU law more efficient, including the possibility for other entities to step in and monitor housing production in outlaw municipalities, the quadrupling of the current Article 55 fee, and the possible inclusion of intermediary housing in the definition of what constitutes social housing stocks.

DIVIDED NEIGHBORHOODS: GENTRIFICATION AND TRANSPORTATION AMONG PORTLAND'S LOW-INCOME BLACK HOUSEHOLDS

Abstract ID: 1177

Individual Paper Submission

HOWLAND, Steven [Portland State University] showland@pdx.edu, presenting author

Portland, Oregon's historically segregated neighborhoods have undergone extensive gentrification over the past two decades. Coupled with skyrocketing housing prices throughout the city, low-income Black households have been increasingly pushed to the peripheries of the city, particularly to East Portland (Gibson, 2007). Such housing dynamics heavily affect low-income Black households in Portland. The center of Black culture is still centered in the gentrifying Albina neighborhood with many institutions like Black churches and barbershops offering a safe community in a city where the Black population is very small relative to other large cities in the U.S. As the distances to these institutions grows, it is harder for families to engage in those institutions. Similarly, the more suburban land-uses of East Portland mean there are likely fewer choices of where to go for daily needs and a need to travel further to get to them.

In this paper, I use interviews with 27 low-income Black residents, evenly divided between the Albina neighborhood and East Portland to answer the following questions about low-income Black families in Portland:

- How do their neighborhood environments impact their ability to complete their day-to-day activities?
- How does having friends or family in the other part of town affect their ability to receive help from them?

These questions focus on comparing the stories of those living in Albina and East Portland with an emphasis on transportation as a critical component of them being able to complete their day-to-day activities. I used thematic analysis to highlight commonalities of where they were going, how they were getting there, and difficulties they had in going to the places they wanted/needed to go.

I found that for residents in Albina, gentrification has been a mixed-bag. They remain close to friends and family that still live there, and the neighborhood is familiar as most grew up there. But that is slowly deteriorating as more and more of their friends and family move out, and the neighborhood they grew up in is no longer theirs. Residents highlighted being able to easily walk places was a major advantage of living there. Meanwhile, those living in East Portland limit their activities to specific bus or train lines that go to their house, travel further distances to complete their daily activities, and confront many more safety issues than their Albina counterparts. They too rely on their friends and family that live nearby, but they rely a lot on their family living in Albina even though that trip often adds stress to their life.

Few studies have looked at gentrification from a transportation perspective, or particularly how gentrification impacts the ways families get around. Findings from this study can help planners better understand the implications of dispersal housing strategies that are not well controlled, in particular encouraging the phenomenon of gentrification. These findings also help housing and transit advocates in pushing back on city policies that encourage the negative effects of gentrification.

THE MARKETIZATION OF PUBLIC LAND UNDER AUSTERITY: THE CASE OF LOCAL AUTHORITY HOUSING COMPANIES IN LONDON

Abstract ID: 1194

Individual Paper Submission

BLOOM, Aretousa [Bloustein School, Rutgers University] aretousa.bloom@rutgers.edu, presenting author

Set against the backdrop of austerity-led state restructuring and a post-recessionary real estate boom, local authorities in London have started assuming what appears to be a greater role in housing and land markets through the use of council-owned companies to build homes (across a mix of tenures) and to generate a long-term revenue stream for municipal purposes. While there is currently no formal count, surveys estimate that around 150, or about a third of all local authorities in England have set up a housing company since 2014, with the highest concentrations being in London and the South East where land values are the highest (Hackett, 2017).

Local authorities are setting up housing companies for a number of reasons. Within the immediate realm of

housing finance, the use of trading companies has allowed local authorities to circumvent the centrally-imposed cap on their local housing debt (the only part of local government debt that is capped), and to shield future properties from the ‘re-invigorated’ Right to Buy – the policy that gives council tenants the right to buy their homes at a discount, first introduced by Margaret Thatcher’s administration in 1980, and revamped in 2012 under the Conservative-Liberal Democrat coalition. In addition, local authorities are assuming the role of property developers in an attempt to secure alternative sources of income in the context of enduring austerity. Local authorities have then re-emerged as public housebuilders and land developers, but have done so largely using a commercial approach: the housing is technically private, and in the absence of grants for affordable housing, the majority of the new units are set to be at market rents.

The unregulated growth of local housing companies has in turn given rise to a series of tensions and contradictions over the use of municipal land, as local authorities attempt to advance often conflicting housing and revenue objectives. Local authorities are also assuming new forms of risk that have the potential of amplifying the very fiscal and housing crises that they are attempting to solve. They bear, for example, the risk of development not occurring, the risk of bankruptcy, and the risk that a greater share of local revenue is spent servicing debt if companies fail to become profitable.

Drawing on policy documents and interviews with key local authority actors, legal consultants, policy analysts, and others, this paper examines why and how local authorities in London are setting up wholly-owned housing companies, and with what effects. More specifically, through a multiple-case and multi-scalar research design, I address the following questions: (1) What are the contextual drivers for the rapid rise of state-owned housing companies at this particular political-economic conjuncture? (2) What are the motivations for the creation of housing companies from the perspective of state actors? (3) What logics and rationalities influence the policy design process particularly in relation to the financing and valuation of land, as well its future use, management and ownership? (4) What problems and contradictions have emerged as this land strategy is brought into practice?

The key argument advanced in this paper is that an analysis of local authorities as property developers needs to be sensitive both to the idiosyncrasies of land and the historically contingent practices through which rental income is extracted from it, and to the role of the state as manager and mediator of political and economic crises. The research contributes to a growing literature on public land ownership and the marketization of public land, and to debates on urban governance under conditions of deepening austerity and crisis (Christophers, 2017; Whiteside, 2017; Jessop, 2002; Peck, 2012).

AN END TO MIDDLE CLASS WHITE HOUSING PRIVILEGE: INTERROGATING CHANGES IN THE BAY AREA HOUSING MARKET, 2008-2017.

Abstract ID: 1197

Individual Paper Submission

PIERCE, Joseph [The University of Oklahoma] joe.pierce@gmail.com, presenting author

Subsequent to the housing-led financial crisis in the late 2000s, the prices of housing in many U.S. metropolitan areas stagnated for years at levels well below their peak. However, in a handful of key regions

around the nation, including the Bay Area, home prices (inasmuch as they fell) rapidly regained and surpassed their prior market values. These ‘globally desirable’ cities in the U.S. and elsewhere—Vancouver and Toronto are other North American examples—have become sites of international capital accumulation, where globally wealthy families are simultaneously parking wealth in real estate and using these homes as insurance policies should they need to facilitate relocation or utilize the American health care system (The Economist 2017). This international intensification of already-ongoing wealth accumulation has led to some truly remarkable patterns of urban property valuation. San Francisco’s average house price broke above 1 million dollars in 2013 and 1.5 million in 2017 (Paragon 2017).

This paper asks: what happened to the relationship between Bay Area real estate price dynamics and regional housing politics between 2008 and 2017? This paper analyzes a combination of real estate records and archival data to argue that what has occurred in the Bay Area during the last decade is the rapid passing of an inflection point in which middle and upper middle income, white-identified professionals can no longer afford to own or to rent homes in the region’s core municipalities except in exceptional circumstances. What we are seeing in response, is a widening of a ‘politics of poverty’ to exceptionally privileged households by historical standards. In principle, this is an alarming development, but it is not intrinsically a more alarming situation than one where low or moderate-income households cannot afford to secure adequate housing. Yet despite the increasingly heated rhetoric of housing [in]justice in the Bay Area over the past 10 years, relatively little has changed about the increasing unaffordability of housing. I argue that this is in part because the underlying pricing dynamics are not driven by population levels directly but by an influx of capital that is essentially untethered from the ‘normal’ dynamics of the labor market.

There are two important lessons for the planning community to learn from the unusual housing market conditions in the Bay Area. The first is the surprising futility of housing justice as a motivating framework for systematic urban policy. If a substantial voting block consisting of educated white middle-class households being rapidly priced out of neighborhoods cannot successfully motivate broadly relevant political solutions, this bodes poorly for the efforts of low and moderate-income voting blocks, even in less expensive cities. The Bay Area case illustrates how few widely palatable policy tools are currently available for mitigating unaffordability in the face of regionally pervasive housing price pressure. The second major lesson is evidence of what it takes to motivate upper-middle class households to take up the cause of housing justice: namely, their own housing options must be at immediate risk. The paper closes with a discussion of how the case of the Bay Area over the past 10 years illuminates some of the conditions that would be necessary to cultivate a durable political commitment to adequate housing that reaches all the way to low-income households.

SARMIENTO, Luis [El Centro Cultural de México] luis@elcentroculturaldemexico.org, co-author

Since Arnstein's 1969 seminal publication "A Ladder of Citizen Participation", there has been an important shift toward community-based research to examine participation in community development in the United States. Part of this trend stems from efforts by the state to detach itself from responsibilities for public participation in community development at the local level. Another reason includes a popular assumption by community-based scholars that community-based research might better capture power-sharing questions. There is a gap in the citizen participation literature, however, in that there is the need to transcend generalized descriptions of residents and community groups engaging in innovative citizen participation activities inside public-private participation activities tied to process, outcomes, and compressed deadlines (Brody, D. S., Godschalk, R. D., and Burby J. Raymond 2003). A noteworthy and timely research need is to enter more deeply into the complex nuances of community development campaigns initiated by resident groups and their housing, health, and cultural institutions and community organizing allies, both inside and outside public-private participation practices and do so in a wider temporal scope than typically the case in citizen participation research. Moreover, there is no, to our knowledge, critical research that offers a within city comparative analysis of different community development campaigns that included in their objectives challenges to and reforms for the local public participation planning process and community development policy focused on government transparency, anti-commercial gentrification, and community control over vacant parcels of public land. This article attempts to address some of these gaps in the literature by merging the complexity of real-world experience to theory. We offer questions that concern the manner by which the inside-outside participation model addresses particular issues that are increasingly visible in today's urban and community development context of major cities, such as the commodification of housing, residential and spatial alienation, and gentrification (Madden and Marcuse 2016).

1. How does the inside and outside participation model address the power-sharing needs in today's majority-minority, immigrant, and lower-income inner cities?

2. In terms of practice, what changes to the built environment and urban governance resulted from the inside-outside public participation model?

This case study is based on three participation and community development policy campaigns in Santa Ana, California. We used process mapping methods, participant-observation modes of inquiry (Yin 2003), archival research, and interviews. The campaigns are the 2008 Community Benefits Agreement, 2010 Sunshine Ordinance, and the 2012 Wellness Corridor Resolution. These were initiated by the Santa Ana Collaborative for Responsible Development and the Equity for All Coalition, groups with a history of activist engagement with a track record of concrete policy changes despite noteworthy urban political and urban hardship challenges in this majority Mexican-American, Mexican, and immigrant city (Beard and Sarmiento 2014). The campaigns were a collective urgency to both fulfill and redefine power-sharing ideals between developers and city elites and resident groups and their allies in the face of rapidly encroaching gentrification, transit-oriented development, and new urbanist revitalization. The first and second authors are activist scholars and the remaining authors are campaign coordinators, community organizers, and policy analysts, all of whom had direct involvement in at least two of the campaigns in this study. We show that the move toward what we call street power and community control as suggested by Arnstein takes a more non-linear path than a ladder may suggest and was more successful when community groups initiated a mix of community organizing and more traditional deliberative planning tactics and strategies and carried them out inside and outside public-private planning processes. While city hall adopted or considered some components to all these campaigns, the inside-outside approach was slower, more evolutionary, unpredictable, time-consuming and stress-inducing than standard public-private citizen participation planning that the city had sponsored in the recent past.

PLANNING FOR DEMOLITION IN SHRINKING CITIES—— EVALUATING NEIGHBORHOOD PLANNING IN YOUNGSTOWN, OHIO

Abstract ID: 1210

Individual Paper Submission

GAO, Shuqi [Tsinghua University] shuqigao@mit.edu, presenting author

RYAN, Brent [Massachusetts Institute of Technology] bdr@mit.edu, co-author

Shrinking cities and the range of resulting negative byproducts have become key features of the current rust-belt landscape. Among their various byproducts, vacant and abandoned properties are the centerpiece of planners and local authorities’ concerns (Hollander, et al., 2009). Although many localities have proposed several ways, like code enforcement and tax foreclosure, to tackle the urban vacancy, there is still a crucial problem remaining: the lacking of any plans to guide the process (Accordino & Johnson, 2000; Dewar, 2006). This study focuses on a well-known shrinking city for its “smart-decline” comprehensive plan, literally Youngstown, its new initiatives to response the aforementioned problem. Since 2014, leading by a community development corporation (CDC) —— Youngstown Neighborhood Development Corporation (YNDC), many Youngstown’s neighborhoods have released and are implementing Neighborhood Action Plans, in which detail parcel-based strategies including demolition, code enforcement and etc and have a five-years’ term of implementation. This study specifically focuses on the plans’ demolition-oriented strategies that have been undertaken by two major entities, county land bank and city government. Therefore, our major research question is: how have the suggested demolitions been implemented by the two entities in terms of demolition. Additionally, our major research motivation is to examine the ongoing Neighborhood Action Plans’ implementation to see collaborative plan’ possibility and feasibility toward tackling the urban vacancy. This study adopts a combination of quantitative and qualitative research methods to answer the research question. Quantitatively, we employed a parcel-based GIS method to compare the Neighborhood Action Plan’s suggested demolitions with the actually demolished parcels to check each plan’s conformance and performance. Qualitatively, we interviewed multiple participants of the Neighborhood Action Plans and crucial stakeholders within related parties, including local neighborhood associations, county land bank, city departments and city council, to inquire details regarding the plans’ making, implementing and evaluating process. Our major findings are as followed. Firstly, we found that the county land bank differs drastically with the city government on implementing the Neighborhood Action Plans’ suggested demolitions that the former has a much higher conformance rate in every neighborhoods than the latter. Second, almost every neighborhoods have relatively high performance rate of the both entities in terms of the number of demolished parcels. Third, the Neighborhood Action Plans’ quarterly-based evaluation meetings are not really put into effectiveness since the plan progress tracking is not clear under complicated collaborative relations. Fourth, we found differentiated feedbacks toward the Neighborhood Action Plans’ implementation in different neighborhoods. This study reveals the bottom-up efforts in a shrinking city that combat with the disinvestment and population loss. Though not being perfectly implemented as supposed, the experience of Neighborhood Action Plans is still worth learning for many other shrinking cities in and beyond the US.

SHIFTS IN THE RENTAL HOUSING LANDSCAPE: IMPLICATIONS FOR TRANSIT ACCESS IN LOS ANGELES, CA

Abstract ID: 1215

Individual Paper Submission

GUY, Tam [University of California, Los Angeles] tamjguy@gmail.com, presenting author

Overview of research

Location matters to households for both housing and transportation decisions. As policy makers seek to lower greenhouse gas emissions and vehicle miles traveled, households face a common related issue: rising housing costs. Simultaneously, median wages have remained stagnant. In a hot market, rental housing prices respond faster to market pressures than mortgages as leases are generally not in 30-year fixed terms (Hwang & Quigley, 2006). This can put renters, especially those in regions with growing populations like Los Angeles, in a situation that requires them to relocate in order to find housing at an affordable price point. Some households, especially those with low incomes and no car access, prefer to locate in transit-rich neighborhoods (Glaeser, Kahn, & Rappaport, 2008). Yet, with the return of affluent households to urban housing, this could mean that lower-cost rental units shifted away from urban centers (Lee, 2011). Through this research I examine where rental units at various price points were at two time periods in the Los Angeles region and the associated differences in transit accessibility.

The purpose of this research is first to identify whether and where shifts took place in Los Angeles, CA in the locations of rental housing units across multiple cost brackets, then to identify the associated shifts in transit accessibility for those cost brackets, with a special attention to lower-cost units.

Research questions

Research question 1: What were the changes in the spatial distribution of rental homes by monthly gross rent brackets between the American Community Survey 5-year datasets 2006-2010 and 2012-2016 in Los Angeles, CA?

Research question 2: Based on the changes in spatial distribution of rental homes by monthly gross rent brackets, what were the associated changes in transit accessibility?

Research methodology + data source

Secondary data. Using American Community Survey (ACS) data, I compare the ACS 5-year datasets 2006-2010 and 2012-2016. The ACS includes counts of units within a range of monthly gross rents brackets at the census tract level. Adjusted for inflation, the ACS data can reveal which areas lost and/or gained units during the time period. Transit accessibility by census tract can be measured via the US Environmental Protection Agency's Smart Location Database transit variables, such as destinations accessible by transit.

Analysis. I use geographic information system (GIS) software to look at the shifts within the ACS data in the quantity and location of rental housing units available in each gross rent bracket by census tract. Based on the shifts in location of concentrations of units in a given rent bracket, I calculate the change in transit accessibility. For example, if 100 units at or below \$X of rent were available in 2006-2010 in downtown Los Angeles (census tract A) and only 40 units remained available in 2012-2016, 60 units at or below \$X either increased in another part of Los Angeles (census tract B) or were lost overall in the region. The associated accessibility change would be the difference of the transit accessibility ratings between paired census tracts A and B for rental bracket Z at \$X.

Findings

Research in progress, to be finished by August 1, 2018.

Implications and actionable conclusions

Counting and locating shifts in these rental homes over the time period can reveal transit accessibility shifts influenced by rental housing pressures. Services associated with the income segments which reside in lower-cost rental housing neighborhoods—everything from employment services to transportation—would need to adjust accordingly. The implications of these paired shifts might warrant adjusting policies related to affordable housing (Hamidi, Ewing, & Renne, 2016), transit services (Giuliano, 2005), and economic development in the region (Lee, 2011).

THE EFFECT OF SHORT-TERM RENTALS ON LONG-TERM RENTAL RATES: ANALYSIS OF AIRBNB LISTINGS IN ELEVEN CITIES IN THE US.

Abstract ID: 1227

Individual Paper Submission

BESHARATI-ZADEH, Arezoo [University of California, Berkeley] arezoo_bshz@gmail.com, presenting author
WADDELL, Paul [University of California Berkeley] Waddell@berkeley.edu, co-author

Urban vacation rentals, such as those listing on Airbnb, have surged rapidly in U.S. cities in recent years. This phenomenon raises issues of concern to elected officials, planners and housing advocates about the potential impact of Airbnb listings on communities and housing market. Since the launch of Airbnb, there has been a controversy over its benefits and its external costs on local neighborhoods, and that controversy made it difficult for policy makers and city officials to determine whether and if so how, to regulate it. One reason for this lack of policy guidance is the absence of research on these questions.

Some research has examined the impacts of Airbnb on the hotel industry (Zervas, 2017), and on the spatial pattern of Airbnb listings in cities such as New York, Austin, Boston, and Chicago (Cole et al, 2017, Wegman 2017). But only limited research has been published on the impact of Airbnb on housing markets (Barron et al, 2017; Horn and Merante, 2017). Merante examined the impact of Airbnb in Boston. This research, which examines Airbnb effects on long-term rental housing markets, contributes to the emerging literature on Airbnb in two primary ways. It is the first study that has been done on multiple cities across the United States. It is also novel in that we combine Airbnb data with a new source of big data, daily rental listings from the Craigslist website, to assess impacts of Airbnb on long-term rental rates.

Research has been limited by the lack of available data on Airbnb home-sharing. Airbnb does not provide access for researchers to download the data for its listings directly from its website, like Redfin does for sales listings. To overcome this limitation, this research collected and analyzed Airbnb listings for more than ten major

metropolitan areas in the U.S., using different web scraping methods over the period of six months.

This paper explores the density and nature of Airbnb listings in eleven Metropolitan Areas and their implications for communities and housing market. Rental listings from Craigslist was used to estimate a hedonic regression model to estimate the impact of Airbnb on long-term rents. Our result suggest that although Airbnb advertises that their site is meant for people who want to rent out their house during their own holiday or to rent out a spare room to make an extra money to pay the rent, it has become apparent that some hosts use Airbnb to rent out entire homes, in which they do not live, the entire year. A large proportion of listings in almost all studied areas appear to be commercial hosts with more than three listings. Also, our regression analysis shows that Airbnb density is strongly correlated with higher rents in all metro areas.

REMOVING THE MARKET MASK IN BALTIMORE: AN ALTERNATIVE VALUE ANALYSIS

Abstract ID: 1233

Individual Paper Submission

DEVEREUX, Christina [University of Southern California] schopper@usc.edu, presenting author

In an effort to address widespread property abandonment, the City of Baltimore currently uses a Housing Market Typology map to strategize where to invest its limited municipal resources. The map was created using Market Value Analysis, which uses market and housing indicators to divide Baltimore into five color-coded zones. Purple indicates “regional choice” neighborhoods with strong housing markets, while red indicates “stressed” neighborhoods with virtually no housing market. For the past decade, the City has been using iterations of these maps to make decisions about where to invest its limited municipal resources. Its strategy is to focus resources in middle-market neighborhoods and to move people out of bottom-market neighborhoods, which it deems too financially disinvested to be revitalized in the near future.

The quantitative market data used to create the Housing Market Typology map appear, on their face, to be objective measures of the states of neighborhoods. However, when compared to the data used to create redlining maps in the 1930s, their objectivity is called into question. Indeed, the similarity with the now denounced redlining maps is clear: of the 10 indicators used in the creation of Baltimore’s Housing Typology Map, six appear in some iteration in the “area descriptions” the Homeowners Loan Corporation used in 1937 to evaluate and rank neighborhoods. This current iteration of disinvestment, in which the agent is the municipality, as opposed to private lenders, demonstrates the profound implications of a neoliberal model of community development for future racial equity in a city with a charged history of racism.

Using GIS to overlay Baltimore's racial demographics, urban renewal areas, and vacancies with its Housing Market Typology map, I demonstrate that the trajectory and targets of disinvestment in Baltimore have been consistent over the past 80 years. I then use alternative indicators, chosen in conjunction with residents of neighborhoods deemed "stressed" according to market indicators, to create maps that tell a different story about "regional choice" and "stress" in Baltimore's neighborhoods. One key finding is that by focusing on only market resources to decide where to make infrastructure improvements and where to disinvest municipal resources, Baltimore City is actively disinvesting in neighborhoods most densely populated with its most precious resource: children.

This paper is relevant to practitioners of planning as it points to equity concerns that arise when increasingly accessible quantitative data is used to dictate the course of local policy, without appropriate regard for historical and community context. The paper will be of interest to planning scholars interrogating the objectivity of the data planners habitually use. On a more abstract level, this work addresses foundational questions – as they are currently playing out in the neighborhoods of Baltimore – about the role of municipal government: whether it is to provide services in an equitable manner to all citizens, or whether it is to facilitate economic development and growth. In partial response to these foundational questions, it points to the limitations of depending on market mechanisms to address housing market failures in urban communities.

IF YOU LET THEM BUILD IT THEY WON'T NECESSARILY COME: ACCESSORY DWELLING UNITS AND THE LIMITS OF LOCAL LAND USE REFORM

Abstract ID: 1235

Individual Paper Submission

MAKAREWICZ, Carrie [University of Colorado Denver] carrie.makarewicz@ucdenver.edu, presenting author
SCHAFRAN, Alex [University of Leeds] a.schafran@leeds.ac.uk, co-author

For decades, planners and researchers have promoted Accessory Dwelling Units for the potential benefits they offer to homeowners, tenants, and municipalities, including housing for seniors to age in place; affordable housing for smaller households; extra rooms for extended families; and infill housing in suburban areas seeking densification. Given these reasons, a growing number of U.S. cities and towns have adopted ADU ordinances. Yet, the production of ADUs remains quite low, especially compared to Vancouver's production of more than 2,000 ADUs since 2010.

Existing research on ADU production notes both the permission to build ADUs and the capacity and political support to promote them are crucial for ADU production. But few studies have explored the varying nature of ADU ordinances or the reasons planners may or may not promote them, even if they are permitted.

This paper is based on three iterative ADU studies in metro Denver from 2012 to 2017. The first, conducted in 2012, combined interviews and email exchanges with planners, activists and elected officials active in the ADU question in Colorado; field work in metro Denver municipalities; and extensive archival and document-based research focused on the proliferation of ADU development in the United States. The second study was conducted in 2013 and 2014 and involved 49 semi-structured interviews with professionals and activists involved in the

planning, promotion, financing, development, and selling of ADUs in metro Denver and the other cities in Colorado. A follow-up survey and interviews were conducted in 2016 and 2017 of the 59 jurisdictions in the Denver regional planning area.

Metro Denver is a prime example of the issues explored in more recent ADU studies. Its ideal conditions for ADU development—a mounting housing crisis, a growing and aging population, and a sprawling suburban land use pattern—have prompted more planners and policymakers to legalize ADUs. Between 2012 and 2017 the number of permitting jurisdictions increased from 12 to 23, with three more considering it. Still, only 3 of the 23 municipalities reported more than 100 legal units having been developed, and most report many fewer than 50, if any. We draw five conclusions from this research. First, the origins of ADU ordinances are mostly planner driven, with a few exceptions, but motivations are widely divergent. Second, the diverse motivations are in part due to the complexities by jurisdiction type, from urban cities to rural counties, such as overlapping districts for water and sewer, and limited land use tools in unincorporated areas. Third, there were varying degrees of contentiousness, but most planners remained cautious. Fourth, to avoid potential contentiousness, planners have intentionally implemented incomplete and prohibitive codes, e.g. with high parking requirements, small footprints, and owner occupancy requirements. Fifth, the planners are unable to actively promote ADUs, either to avoid political issues or because they realize the prohibitive nature of their code.

The gap between permission and production has important implications for both theory and practice. For theory, our findings show a limit in ideological debates over the specifics of land use regulation related to affordable housing. A more holistic approach needs to consider specific regulations as one of many factors prohibiting higher levels of affordable housing development. For practice, we argue most municipalities do not have sufficient resources to promote ADUs independently, given the numerous barriers. Regions need an “ADU Resource Hub” to support municipalities. It should include ADU advocates and builders from local government, banking, the non-profit sector, design and development firms, regional agencies, foundations, and universities. We explore the challenges and opportunities for a Hub in the Denver metro area.

THE NEW LOCALLY-OWNED SINGLE FAMILY RENTAL MARKET: UNDERSTANDING THE MOTIVATIONS AND BUSINESS MODELS OF SMALL-SCALE PROPERTY MANAGERS

Abstract ID: 1252

Individual Paper Submission

MCMILLAN, Andrew [The University of Illinois at Urbana-Champaign] ajmcmil2@illinois.edu, presenting author

In the wake of the foreclosure crisis in the United States, the single-family rental (SFR) market grew rapidly and appears to be a lasting fixture even as the housing market recovers. Many recent studies have focused on the emergence of large-scale corporate landlords of single-family rental properties (Sul 2015, Fields, Kohli, and

Schafran 2016, Raymond, et al. 2017), although there is evidence that the number small-scale single-family property managers have also increased (Immergluck and Law 2016). Single-family rental properties can contribute to neighborhood distress if investors purchase properties in poor condition and perform minimal maintenance. But single-family rental managers can contribute to neighborhood stability by rehabilitating and productively using properties that may have otherwise remained vacant (Mallach 2010). But little is known about why single-family property rental investors choose to purchase and operate certain properties.

This study builds on previous work that examined real estate investor purchases of real estate-owned (REO) properties in the Chicago region (McMillan and Chakraborty 2016). It found that many of the small-scale real estate investors entered the rental management business in the wake of the housing market crash were mostly active in largely African American neighborhoods in the City of Chicago and in the region's older, inner-ring suburbs.

Through interviews with real estate professionals, property managers and local government officials in the Chicago region, this study will examine the factors that small-scale real estate investors consider when selecting single family properties for rental use. The questions of this study include: (1) What property-level or neighborhood-level qualities to investors look for when seeking a single-family rental property? (2) Do local, small-scale investors differ in their selection and operation of single-family rental units compared to large institutional investors? and (3) What can local governments do to attract single family rental property managers that contribute to neighborhood stability or revitalization and discourage property managers that exacerbate neighborhood distress?

This study is expected to identify issues that planners and local government officials should consider when planning for housing recovery. A preliminary analysis gathered from completed interviews suggests that local, small-scale investors are more likely to accept housing choice vouchers than large-scale single-family rental property investors.

THE IMPACT OF HOUSING PURCHASE RESTRICTION ON HOUSING MARKETS—A NEW PERSPECTIVE FROM MODELLING BUY-SELLERS IN TRANSACTION NETWORKS

Abstract ID: 1269

Individual Paper Submission

ZHANG, Ziyi [Cornell University] forest.zzy@gmail.com, presenting author

Housing purchase restrictions (HPR) in China have drawn a lot of attentions due to its huge influence on markets and households. Current literature focuses on the effectiveness of this policy instrument using longitudinal housing price data in multiple cities and employing econometric methods such as difference-in-differences

analysis. These studies provide the big picture that how HPR has reshaped the housing price growth. However, the micro mechanisms of HPR affecting intra-urban housing market are still understudied. Intuitively, HPR imposes constraints on some households so that their demands cannot be fulfilled. This paper argues that this understanding is only about the direct impact of HPR on households and markets. There are considerable indirect impacts generated through transaction networks triggered by HPR, which have been overlooked in current market frameworks.

In this paper, we propose a transaction network model featuring a new type of households who are both buyer and seller at the same time. We show that this introduction deepens our understanding of market mechanisms and policy implications related to HPR.

Traditionally, economic models treat buyers and sellers in a dichotomic manner, that is, a market participant is either buyer or seller at a given time. However, in many durable good markets such as housing, it is common that one could be a buyer and seller at the same time, and has to make these two decisions---buy and sell---simultaneously (we call this type “buy-seller” in the following). For example, for a single-house owner, switching house involves selling the previous house and buying a new one at the same time. According to our survey for housing buyers in Beijing from July to August, 2016, 45% of our sample (1192) are “exchange buyers”, who are selling a housing unit while purchasing the new one.

As a buyer, one’s successful sale is necessary for his new purchase due to a budget constraint or some policy restrictions; as a seller, he cannot sell without a successful bid, or he will have to rent for living. From the perspective of network, more interestingly, one’s failure in either buying or selling will fail all potential transactions linked to him, and will trigger a ripple effect to the whole bidding and transaction network.

Despite of its existence and significant role in the housing market, the buy-seller and its independence feature have not been explicitly modeled yet. In this paper, we propose an analytical framework and an agent-based model (ABM) for markets with 3 types of households: pure buyer, buy-seller, and pure seller. First, two basic successful patterns---loop and chain---are identified under simultaneous bidding mechanism with limited information (every trader only knows his own information). The HPR are interpreted as a shock converting some pure buyers into buy-sellers, and direct and indirect influences are theoretically measured under the proposed framework. In addition, the role of housing broker industries is introduced as “bidding contracts” which give buy-sellers who fail in bidding/selling additional time to bid/sell before rejecting/withdrawing, and thus increase transaction chances of the whole market.

This research, for the first time, introduces the behavior of buy-seller type market participant to understand the micro mechanism of HPR, and shows the total impact (direct and indirect) of HPR on the whole market. For the ABM literature, this study provides a way to incorporate buy-seller type, and tackles the loop identification issue in ABM algorithm. It is especially significant for empirical ABM applications to regions where resale housing market is dominant.

THE ROLE OF ACCESSIBILITY TO JOBS AND TRANSPORTATION ON RESIDENTIAL MOBILITY OF HOUSING CHOICE VOUCHER RECIPIENTS

Abstract ID: 1275

Individual Paper Submission

KIM, Woolack [University of Cincinnati] kimwc@mail.uc.edu, presenting author

Housing Choice Voucher program, which serves about 2.1 million low-income households with tenant-based housing assistance for rent and utility, is intended not only to provide rental subsidy to lessen housing burden but also to promote housing mobility to provide low-income families with higher social and economic opportunities. Since families who obtain a housing choice voucher can choose where they live, advocates of the program expected that the families will move to better neighborhoods with lower poverty rate, better school and public services, and higher safety. According to residential mobility research, however, a lot of voucher holders are still living in neighborhoods with high poverty rate, although they live in relatively lower poverty and higher education level neighborhoods than the neighborhoods they have lived before the program. Furthermore, voucher holders who moved to neighborhoods with lower poverty rate have not shown positive improvement in economic self-sufficiency (McClure, 2013; Sanbonmatsu et. al., 2011; Ludwig et. al., 2012).

Recent studies point out that there is another important factor that influence residential mobility of voucher holders which is accessibility to jobs and transportation. They argue that transit access to family, jobs, schools, social networks, and institutions was a primary concern to the voucher holders when they choose the place they moved to through the program. They also found that voucher holders who moved to places with higher access to public transit and jobs more likely to live in neighborhoods with lower concentrations of poverty, higher employment rate, higher median rents, more owner-occupied housing, lower vacancy rates, greater access to open space, and lower levels of cancer risk. This implies that better accessibility to transportation and jobs can enable voucher holders to better search for housing as well as provide access to potential employment, public services, and other opportunities within a reasonable travel time (Graves, 2016; Pendall et. al., 2014).

This study aims to find the role of accessibility to jobs and transportation on residential mobility of voucher holders empirically. In order to identify this, the study will answer to a question: Does housing choice voucher recipients moved to neighborhoods with lower poverty rate or neighborhoods with higher jobs and transit opportunity? In order to answer this question, this study first develop a measurement of job accessibility by different transit modes to identify where higher accessibility areas are located. Further, using longitudinal housing choice voucher mobility data in the Cincinnati Metropolitan Area (Cincinnati MSA), this study tracks residential mobility patterns of individual voucher holders to address where they have moved to in relation to job accessibility indices.

This study found complex outcomes. Voucher holders in high poverty neighborhoods are more likely to relocate to neighborhoods with higher employment opportunity accessible by public transit and lower poverty rate. However, their mobility pattern shows opposite direction when we consider employment opportunity accessible by walking and car. This study can provide policy implication for the future housing policy based on those findings.

SEGREGATING ACCESS TO MORTGAGE CREDIT: A SPATIAL ASSESSMENT OF RACIAL INEQUITIES IN THE MORTGAGE LENDING MARKET

Abstract ID: 1293

Individual Paper Submission

HAUPERT, Tyler [Columbia University, GSAPP] th2675@columbia.edu, presenting author

This study examines the relationship between neighborhood racial composition and access to mortgage credit before and during the period of recovery from the mortgage lending crisis in the United States. Beginning in the early 20th century with the adoption of Home Ownership Loan Corporation redlining maps by private and government lenders, a long history of discriminatory mortgage lending practices exists in the U.S. Despite the passage of 1968's Fair Housing Act, mortgage discrimination continued to contribute to residential segregation and the uneven distribution of home equity for both minority borrowers and in minority neighborhoods. During the subprime lending crisis, reverse redlining resulted in minority borrowers and neighborhoods being targeted for sub-prime loans (Been, Ellen & Madar 2008), which contributed to higher rates of foreclosure among minority borrowers and in segregated minority during the subsequent downturn (Rugh & Massey 2010). Additionally, the post-crisis housing market recovery saw continued racial disparities in both mortgage lending outcomes and credit costs (Faber 2018) with increased inequities in highly segregated areas (Hwang et al. 2015). Given these findings, the links between mortgage lending outcomes and borrower race, neighborhood racial composition, and levels of segregation are clear. However, a focus on patterns of inequities in historically disadvantaged neighborhoods has left the outcomes of minority borrowers seeking mortgage credit in majority-white neighborhoods under-studied. Accounts of racial steering by realtors and borrower self-selection indicate that these factors contribute to low levels of minority borrowers seeking credit in majority-white neighborhoods. However, the outcomes of those minority borrowers that do seek homeownership in such areas has received less attention. This study seeks to fill this gap by assessing mortgage outcomes and credit costs for black and Hispanic borrowers seeking mortgage credit in homogenous white neighborhoods. While previous studies have shown that mortgage lending outcomes and credit costs vary across races and neighborhoods (Faber 2018; Immergluck 2009) and depending on levels of neighborhood and metropolitan-level segregation (Hwang et al. 2015) none have specifically assessed outcomes and credit costs for minority applicants who seek mortgage credit in homogeneous white neighborhoods. Exploring this issue will shed light on whether discrimination in the mortgage lending market is only a force perpetuating disinvestment in minority neighborhoods, or if it also plays a direct role in the maintenance of white neighborhood homogeneity.

To investigate this topic, this study compares mortgage lending outcomes and credit costs for black, Hispanic, Asian, and white borrowers in census tracts defined based on their racial makeup in neighborhoods in the 20 largest U.S. metros. To assess the impact of the mortgage lending crisis and its recovery on these issues, two time periods will be analyzed: 2005 and 2015. Information on credit applicants and outcomes will come from Home Mortgage Disclosure Act, while neighborhood characteristics will be provided by the US Census and American Community Survey. Mortgage outcomes (i.e. approval decisions and credit costs) will be estimated using logistic regression. These outcomes will be measured as functions of neighborhood racial composition (i.e. whether homogenous-white), applicant characteristics, loan characteristics, and additional neighborhood characteristics. Results will allow for an assessment of the impact of seeking credit in a homogenous white neighborhood for minority applicants compared to white applicants, controlling for other potential causal factors.

FROM PUBLIC TO HYBRID: THE CHALLENGES AND OPPORTUNITIES IN A PUBLIC HOUSING AUTHORITY BECOMING A HYBRID ORGANIZATION

Abstract ID: 1316

Individual Paper Submission

GEBHARDT, Matthew [Portland State University] mfg@pdx.edu, presenting author

Over the past 30 years, public housing policy in the United States has favored increasing flexibility for local public housing authorities (PHAs). These changes are exemplified by initiatives such as the Moving to Work (MTW) program, which grants waivers to PHAs from restrictions on use of funds to allow the testing of new, local initiatives, and the HOPE VI and Choice Neighborhoods Initiative (Choice), which give competitive grants to PHAs to redevelop public housing into mixed-income projects that respond to local needs and priorities. These programs and many other smaller initiatives reflect two parallel efforts. The first is to allow greater adaptability to meet specific local challenges and opportunities by reducing or removing federal regulations and review. The second is to reduce direct federal support for PHAs by reducing transfers and encouraging increased leveraging of private finance. In 2011, the Rental Assistance Demonstration (RAD) was introduced as a new tool available to PHAs to finance rehabilitation and preservation. This program continues the pattern of earlier programs, affording PHAs the ability to leverage partnerships and private financing to meet specific local capital investment needs. Recent proposals to expand both MTW and RAD indicate this pattern is likely to continue and expand.

Within the funding and regulatory environment described above, PHAs have had to reassess their operations and approaches. For some, this has meant adopting a defensive strategy, reducing and refocusing their activities (Kleit and Page, 2008). Others have attempted to adapt to the new environment by becoming hybrid organization, blending characteristics and approaches from multiple sectors – public, private, and nonprofit – to further an organizations mission and goals (Billis, 2010; Nguyen, Rohe, and Cowan, 2012). This paper explores the evolution of Home Forward (formerly the Portland Housing Authority) as a hybrid organization. Drawing on documents, interviews, and participant observation, this paper examines how Home Forward has aggressively used the latitude afforded by MTW and more recently RAD to develop innovative intra- and inter-organizational approaches over the past decade to expand its ability to create affordable housing and meet resident needs. To do this, the organization has adopted and adapted an increasing number of private and sector techniques, practices, and strategies while leveraging its position as a government entity and conduit for federal programs and funds. This is particular true of private sector real estate development and management practices. Among other activities, Home Forward has become a large developer of Low Income Housing Tax Credit units, adopted an asset management strategy for their entire portfolio of properties, created a nonprofit subsidiary to facilitate property transactions, established a risk management division to identify and mitigate property and financial risks, and partnered with a range of private and nonprofit developers and financial institutions on new development projects (including a mixed-use, high-rise, cross-laminate timber project). The recent commitment to convert their entire remaining stock of public housing to project-based vouchers through RAD is a continuation of this transition.

The move to a hybrid structure incorporating numerous private sector practices can afford PHAs new avenues to meet organizational mission and public policy goals, as well as an expanded role in local affordable housing provision. Home Forward has been able to raise capital to rehabilitate and preserve its existing stock, while also strategically redeploying resources to create new affordable units. However, the move has also created new tensions including: need to expand and maintain internal capacity and expertise, pressure to contain costs (esp. personnel), exposure to greater financial risk, and challenge of still being a government entity (e.g., procurement requirements). These tensions suggest that this may be a difficult model for other PHAs to successfully replicate.

WHERE WAS THE NEW DEAL? INVESTIGATING DISPARITIES IN PLACE-BASED FEDERAL INVESTMENTS AND THEIR ASSOCIATED HEALTH EFFECTS

Abstract ID: 1318

Individual Paper Submission

CHRISINGER, Benjamin [Stanford University] chrisinger@stanford.edu, presenting author

REHKOPF, David [Stanford University] drehkopf@stanford.edu, co-author

The New Deal (1933-1937) included major community development programs of the 20th century in the United States, and represented an unprecedented public expenditure on a variety of welfare and social initiatives intended to provide relief to American citizens during the Great Depression. A wide literature has documented the enduring positive legacy on individual human capital and health, and critical analyses and activism have clarified how these community development programs were designed and/or applied in ways that omitted African Americans.¹⁻³ Only recently have researchers started to apply modern methodologies to interrogate the full scope and magnitude of this systematic racial exclusion.⁴ Using individual-level 1940 Census data linked to health outcomes from the Health and Retirement Study, as well as sites identified by the Living New Deal Project,⁵ this study addresses three primary questions: 1) Were different kinds of place-based projects more race-neutral in their spatial distribution than others?, 2) Were place-based projects funded under the New Deal associated with mortality outcomes of individuals residing in the communities where public projects were located?, and 3) Were existing gaps between white and black mortality widened by unequal distributions of New Deal investments in community development? By merging multiple databases across years before and after New Deal projects were completed, we offer a picture of how one of the nation's largest packages of social programs contributed to unequal health trajectories among both individuals and communities.

THE EFFECT OF REGULATORY CHANGES ON RENTAL HOUSING IN LOS ANGELES

Abstract ID: 1322

Individual Paper Submission

CRANE, Rebecca [UCLA] Rebecca.E.Crane@gmail.com, presenting author

Los Angeles needs more housing. The median monthly rental price for a one-bedroom apartment is over 50% of the average renter's household income, and the homeless population grew by 23% from 2016 to 2017. To address this shortcoming, California legislators adopted new laws in 2016 to ease regulations and encourage the construction of accessory dwelling units (ADUs)—small, secondary housing units on lots zoned for single-family homes. Prior to this policy change, fewer than 1,000 ADUs had been permitted in the City of Los Angeles in over a decade. After the legislative change, the City permitted 2,200 ADUs in a single year. However, the affect this shift will have on the rental housing market is undetermined; it is unclear whether these permits were for the legalization of some of the estimated 50,000 unpermitted units already filling Los Angeles or if they are markers for newly constructed ADUs.

This research examines what effect the legislative change has on rental housing in Los Angeles by comparing permitting patterns of unpermitted ADUs with those of permitted ADUs at the census tract level. This research engages with past attempts to identify and measure unpermitted ADU construction in California; however, it differs in two primary ways: first, I measure unpermitted units at the census tract level by using assessor and census data; and second, I examine these unpermitted units in relation to the 3,000 permitted units in the City of Los Angeles. Through this mixed quantitative and spatial analysis of ADUs, I am able to determine what neighborhood characteristics are associated with higher levels of permitted versus unpermitted ADUs. This research provides planners a better understanding of how statewide regulatory changes affect ADU construction and permitting within Los Angeles, who benefits the most from the changes, and in turn, how this might affect the availability of rental housing across the city.

ACTIVISM IN THE BUILT ENVIRONMENT: COMMUNITY-BASED ORGANIZATIONS AND ADVOCACY NETWORKS IN THE AFFORDABLE HOUSING DEBATE IN BOYLE HEIGHTS

Abstract ID: 1324

Individual Paper Submission

HERNANDEZ, Ashley [University of California, Irvine] ashleych@uci.edu, presenting author

The neighborhood of Boyle Heights in Los Angeles is currently experiencing two phenomena: gentrification and an affordable housing crisis. The local landscape of social and political relationships continues to intensify due to growing housing insecurity and rising costs of living throughout the neighborhood. Boyle Heights residents and advocacy organizations fiercely engage in public debate with each other, local businesses, outsiders, and political elites. They have struggled to influence development plans in the neighborhood, ensure an equitable distribution of resources, and expand affordable housing. Advocates and community-based organizations (CBO) have largely pursued two contrasting strategies to address these issues. One strategy pursued by professional non-profit CBOs focuses on providing community services, affordable housing options, and advocacy-planning. The other strategy involves insurgent planners. This consists of a coalition pushing an anti-gentrification/anti-displacement perspective. Their underlying goals include efforts to increase direct democracy in urban planning and local governance through confrontational tactics targeting gentrifiers (e.g. coffee shops, galleries). The insurgents have even targeted some professional CBO's, claiming that they are part of the gentrification process rather than the solution. The political activities and networks of professional CBOs require a closer analysis to understand one perspective of this political landscape reflecting the city's political and economic logic on development and housing.

Using the case of Boyle Heights, this paper addresses the types of tactics and political frameworks utilized by CBOs (McCarthy & Zald; Staggenborg, 1988). CBOs engage in the debate with non-contentious social movement tactics, emphasize homeownership for current residents, and utilize normalized political channels of local governance to advance their views concerning urban development. This agenda and tactical approach are contingent upon the networks that CBOs are linked to. Literature on housing advocacy organizations discusses the historical legacy and networks of CBOs and their role in shaping policy but lacks further analysis on the mechanisms used to sustain such networks and how they engage in the politics of urban development (Erickson, 2006; Yerena, 2015). I address this gap in the literature by discussing how organizational networks and tactics can shape social capital and inspire collective action around the distribution of resources (Small, 2006).

This paper examines how networks and tactics help shape local policy grievances and policy outcomes for gentrification and affordable housing. I place such literature in conversation with my own preliminary data retrieved through participant observations at an established non-profit community development corporation located in Boyle Heights in 2017, observations at community meetings and local events, and a content analysis of materials produced by select CBOs from 2017 to 2018. My initial findings present a political landscape in which action, organizing, and agenda setting appear to be shaped by organizational ties to political and business elites of the city, including banks and foundations. The ability of CBOs to effectively address these issues of gentrification and housing seems limited due to their professional character and their networks requiring them to maintain access to funders and political leaders to preserve their resources, political capital, and organizational viability. I argue that dependency on political actors and sources of support can effectively limit the scope of demands and constrain political tactics. CBOs confront shortcomings in their tactical approaches to local issues which may undermine opportunities for marginalized and/or grassroots voices to be accounted for in the debate on urban development and affordable housing resources.

Examining the tensions between CBOs and neighborhood institutions can provide important lessons on how political tactics and networks work in relationship to political representation in the built environment. These lessons have larger implications on the integration of marginalized voices in planning processes and civil society at large.

SMART AND CONNECTED COMMUNITIES: EMPOWERING PEOPLE AND PLACES THROUGH DYNAMIC, COMMUNITY-BASED REAL ESTATE VALUATION

Abstract ID: 1342

Individual Paper Submission

SPENCER, James [Clemson University] jhspenc@clemson.edu, presenting author

Low-income communities across the United States are losing their real estate assets to institutional investors because they lack critical information and analytic tools that larger scale and better equipped investors have. This paper overviews the disparity in the kinds of information – and its resulting access – that puts low-income communities at a disadvantage and makes them vulnerable to disproportional loss of wealth and displacement

from their historic communities. It will outline the multifaceted components of real-estate value in low-income communities, as defined by the community residents, by leveraging what some have called “cities of data.”

This paper contributes to the field of urban and regional planning and its growing subfield of real estate. By proposing the use of Structural Equation Modeling to disaggregate components of real estate value is rare, but appropriate for a complex and differentiated product such as real estate. We anticipate that future studies will use SEM models to extend the study of such a complex product as land and structures. Because real estate and land economics frameworks have driven the debate on property value, it has never taken an extensive look into how it may be possible quantify the broader social constructs that have long been seen to be important, but too abstract to quantify. The inability to monetize the “capital” part of social capital is a challenge the field has faced for years, and our methods are the first we are aware of that attempts to measure it in a way that directly links it to financial decision making. The integrative research here develops a new metric for measuring land and real estate value based on a new Urban Development Index, uses social media data to measure social capital in space, and converts it into real estate value estimates. Our use of newly available social media and Big Data to operationalize a widely accepted socio-economic form of capital allows us to test the extent to which conventional ways of valuing land align with social capital. Moreover, examining structural relationships will enable future researchers to do similar valuation of planning-oriented assets in related fields such as transportation, water and sanitation, and other areas practical importance to communities.

The project will have impact in four areas: 1) research; 2) tool development; 3) outreach/extension; and 4) youth development. First, the quantification of social capital as a component of neighborhood value has never been done, even though scholars have long recognized its general importance. Because it has not been quantified, the real estate field has not been able to value some of the aspects of valuation that most professionals recognize is important, but lack the tools to integrate it systematically into decision making. Second, because our integrated research plan includes the development of a dynamic application that empirically estimates the value of social capital in poor neighborhoods using social media and big data, the project will result in a generalized application that will be replicable at the national level and a platform for adding additional definitions of value based on community-level interests.

TRANSIT ORIENTED DEVELOPMENT WITHOUT GENTRIFICATION: TORONTO AND WASHINGTON DC, A COMPARATIVE EVALUATION

Abstract ID: 1344

Individual Paper Submission

HOSTOVSKY, Charles [Brock University] hostovsky@cua.edu, presenting author

Major revitalization planning projects in the Metro DC will be overviewed along with data about the significant ethnic demographic shifts. The communities **East of the Anacostia River** are in the center of the next substantial transformation in DC. Attention will be paid to one case study - the highly controversial, 15 year, \$400 million

transformation of the Barry Farm neighborhood, which is presently almost entirely occupied by public housing projects. The plan calls for the African American neighborhood of public housing to be redeveloped from single-use, low-income community to a mixed-use, mixed-income neighborhood designed to complement its historic setting and close access to the Metro Station. Public meetings by developers of their plans have been called off because of angry protests from neighbors and activists such as Empower DC opposed to the redevelopment. The Toronto case for the comparative evaluation is Regent Park, Canada's oldest and largest social housing complex dating to the 1940s. This area of Toronto has a long history of government housing, poverty, and higher crime rates. The area is in process of transformation where the old apartments have been demolished but all subsidized renters are guaranteed a new accommodations at the same rate and have been integrated into a new, intensified, mixed use community plan with new, incoming, market rate housing. The presentation reviews planning strategies that can revitalize communities without gentrification.

IS THERE A RELATIONSHIP BETWEEN PLANNING CULTURE AND THE VALUE OF DEVELOPER CONTRIBUTIONS? EVIDENCE FROM ENGLISH LOCAL PLANNING AUTHORITIES.

Abstract ID: 1354

Individual Paper Submission

LORD, Alex [University of Liverpool] a.d.lord@liverpool.ac.uk, presenting author
DUNNING, Richard [University of Liverpool] r.j.dunning@liverpool.ac.uk, co-author
KESKIN, Berna [University of Sheffield] b.keskin@sheffield.ac.uk, co-author

There is now increasing recognition that variations in the behavioural and heuristics norms that define context-specific planning practice are fundamental to explaining variations in outcome. For many researchers considering the behavioural aspects of planning has refreshed long-standing interests in 'planning cultures' (Bramley, 2014; Knieling and Othengraffen, 2009; Sanyal, 2005). In this paper we seek to explore the degree to which variations in one aspect of planning culture might begin to shed explanatory light on variations in local planning authorities' capacity to exact developer contributions. Using a case study of English local planning authorities we produce a regression analysis that finds a statistically significant association between the efficiency with which planning authorities deal with applications for development - measured by the time it takes to expedite planning applications - and the value of developer contributions.

REGIONAL HOUSING TENURE SYSTEMS, A LEVERAGE IN POLICY MAKING: AN APPROACH ON THE YOUTH JEONSE RENTAL HOUSING PROGRAM IN KOREA

YUN, Sungjin [Yonsei University] sungjin_yun@yonsei.ac.kr, presenting author

KIM, Kabsung [Yonsei University] kabsung@yonsei.ac.kr, co-author

Social problems create debates which gives birth to a wide range of policies, and as housing is also a social problem, diverse policy actions exist. Ongoing debates on which policy is best for distributing housing for those in need continue. This debate largely divides into two groups, policies of supply such as public housing production programs and policies of subsidy, i.e. demand-side subsidy programs(Orlebeke, 2000). On one side, many claim that the housing problem exist due to the lack of income than supply, and support subsidy programs. Additionally, there are research that identify flaws of public housing such as little social-mix and negative exterior effects like lower living standards that come with this(Winnic,1995; Turner, 2003). On the other side, some claim that public housing programs lowers housing prices and supplies affordable housing to the market(Krumholz, 2004).

Korea's "Youth Jeonse Rental Housing Program" uses Korea's unique tenure system "jeonse" to solve housing problems for the younger generations and stands in the middle of the feud of production and subsidy. The program aims to ease housing expenses by having the Korea Land & Housing Corporation(LH) contract existing homes through jeonse and re-lease it to the youth, leaving the recipient with a small fee. This shows similarities to public housing programs that provide leases at low prices. However, as it offers housing from preexisting supply from the market, it offers the recipient broader choices, similar to the voucher program(Kwon and Choi, 2012).

This research analyzed how three dimensions of the problem are affected by the Youth Jeonse Rental Housing Program. First in supply, LH was able to, despite with relatively less economic and administrative burden, offer a high level of housing welfare. Secondly on the beneficiaries, the program offers lower prices, a broader range of housing choices and allows to take advantage of jeonse's stability. Furthermore, an active social mix between beneficiaries and non-beneficiaries brings less room for discrimination, a strength public housing production programs lack. Finally, analyzes on the effects towards neighborhoods. Existing hypotheses were somewhat contradictory, as some viewed that the increase of low income beneficiaries decreases the neighborhood's market value, while others believed the program actually boosts market value due to public funding. To justify either of these claims, this research used the Spatial Lag Model(SLM) to further analyze the effects of the program. In result, locations affected by the Youth Jeonse Rental Housing Program showed no signs of discount in real estate or leases, but leases that are within the price limit of the program showed rises. This presents that the program minimizes existing problems of public housing programs such as slumification, but still shares a known problem of voucher programs, albeit in only limited price ranges, inflation, which could lead to a reduction of affordable housing.

This research has opened a new branch for finding the solution towards the conundrum of housing by introducing the Youth Jeonse Rental Housing Program. The program started off by understanding the characteristics of the region and aspects of the market, and led to a solution that is superior to its alternatives in supply, beneficiaries, and neighborhoods. It is nearly impossible to directly apply this to markets without systems like jeonse, but suggests the birth of new solution if social characteristics are properly accounted. Especially as this policy used mixtures of existing policies to harness the strengths and supplement the failings, this research believes that this is a core aspect of finding the solution.

WOLDEAMANUEL, Mintesnot [California State University, Northridge] mintesnot.woldeamanuel@csun.edu, presenting author

HOLMAN, Ryan [California State University, Northridge] ryan.holman.422@my.csun.edu, co-author

Housing affordability has become a pressing concern in the United States' largest cities, where lower income communities are increasingly vulnerable to displacement, as inner city neighborhoods rapidly price-out longtime residents and businesses. Coinciding with this trend has been a renewed interest in urban transit investment, especially in Los Angeles. Concerns, and occasionally loud opposition, have dogged the region's rail projects for decades. Typically the most visible opponents have been affluent homeowners fearing additional development and attraction of crime to their neighborhoods. In recent years, however, lower income neighborhoods have also increasingly mobilized to oppose new transit stations due to fears that they will spur gentrification and ultimately displacement (Hulchanski, 2006; Zuk et al, 2015; Atkinson, 2000).

The purpose of this research is to examine the effect of new transit developments on housing affordability. Using data from the American Community Survey, we analyze the housing data for each of the census tracts that fall within the walk-shed of each of the ten Expo Line Phase 1 rail stations between 2010 and 2016. Los Angeles Metro defines the walk-shed of transit oriented communities as within one half mile of a station. There are 37 census tracts covered by the Expo Line, with all in the city of Los Angeles except for one in Culver City. One reason we selected this rail project is that it was opened in 2012, recently enough to be affected by today's comparable economic conditions. The neighborhoods affected, such as West Adams, are generally lower income than the County median, and are perceived at an elevated risk for displacement by local activists. For purposes of research, we will combine all of these census tracts to form a single "study area" which we can then easily compare with city-, county-, and state-level data.

There are two key measurements that we are tracking, spanning the years immediately before and after the Expo rail line opening. The first is of the distribution of monthly housing costs in each of the census tracts. We intend to track the figures for specifically renters, because the monthly housing costs of homeowners are not as exposed to market fluctuations as renters. The second indicator that we are analyzing among these households is the proportion of monthly income spent on housing. This data allows us to determine how many of these households are spending more than 30% of their monthly income on housing, at which point they are "housing stressed" and considered vulnerable to displacement.

We compare the housing affordability data to that same information for the county, using that as our baseline from which we can determine how much of the change that takes place over those seven years (2010-2016) is aligned with regional fluctuation. We expect to see that during the seven years examined, the monthly housing costs for renters in each of these tracts will have increased at faster rates than the county. We also expect that because housing costs will have increased faster than wages for area residents that the proportion of housing stressed households spending over 30% of their income on housing will have increased relative to the county.

This research demonstrates the change in housing affordability that has occurred in Los Angeles neighborhoods as a result of the new transit station. Ensuring the economic diversity and housing security of Los Angeles' transit oriented communities is critical to the public support and future patronage of public transit projects. With this information, the research will inform the planning community of the unintended consequences of transit projects on housing affordability, and how to be better positioned to mitigate these issues.

HELPING THE NEIGHBORHOOD: IDENTIFICATION OF SUBSTANDARD HOUSING

Abstract ID: 133

Poster

ESTEVEZ, LUIS [St. Cloud State University] lestevez@stcloudstate.edu, presenting author

The social and economic consequences of the deterioration of housing stock in inner neighborhoods in cities across the US are well known. Although causes for this deterioration are multiple, it is certain that the presence of substandard or deteriorated housing can lead to blight conditions, which in turn decreases property values, affects the overall health of local housing markets, increases safety hazards, and reduces local tax revenue. Different and creative strategies have been undertaken to reverse this deterioration. However, before the implementation of any strategy or policy, conducting an analysis of the quality of housing stock is an important step.

Quality of housing is conceived in the literature as a multi-dimensional concept; therefore, every method and tool to assess it depends on the researcher’s specific perspective and conceptualization ([Sinha, Sarkar, & Mandal, 2017](#)). To consider all these dimensions in an assessment is complex, and although some good strategies have been proposed, they require an intensive collection of data ([Kain, 1970](#)).

Traditional ways to identify deteriorated housing have proved to be time consuming and expensive. Neighborhood organizations usually do not have the knowledge and resources to gather data about the structural condition of housing, never mind perform an analysis. Considering this, attempts have been made to come up with a more efficient way to identify substandard housing. Among those strategies, the most effective have relied on property tax information ([Koebel, 1986](#); [Smith, et al., 2003](#); [Sumka, 1977](#)).

This research relies on these latest efforts to create an index to identify substandard housing using property tax information from a central city neighborhood. This paper adds external validation to the creation of these indexes by comparing the results with a field assessment of housing.

This research confirms that the index of housing quality is a valid tool for the identification of substandard housing. The analysis shows that both the index and field assessment give similar results. These findings are relevant because of the direct impact they have on practice by enabling communities to use existing information to identify deteriorated housing. Identifying substandard housing will provide the necessary data for decision-making in the pursuit of funding and policy-making to help neighborhoods reverse the consequences of deteriorated housing.

HELPING THE LAST, THE LEAST, AND THE LOST: COMPASSIONATE PLANNING FOR BALTIMORE'S UNSHELTERED HOMELESSNESS

Abstract ID: 172

Poster

BIANCA-PRUETT, Laura [Morgan State University] labia1@morgan.edu, presenting author

Since the 17th century, American cities have been challenged by the problem of unsheltered homelessness. Distinct from those people who sleep in shelters, temporary or transitional quarters, or temporarily stay with a relative or friend, a person is “unsheltered” when they sleep for at least one night in a place that is not fit for human habitation. While many people experiencing unsheltered homelessness live alone, others live in encampments with others for safety and strength in numbers. While encampments provide otherwise itinerant street dwellers with the advantages of communal living, including enhanced safety, pooled resources and labor, and camaraderie, they pose significant challenges for cities and the various stakeholders of their public spaces. Urban policies have frequently viewed the presence of encampments as nuisances, threats to public safety and public health, and as obstructions to the orderly functioning of the cities. These policies have often been promulgated with little concern for the well-being of those who live in these encampments, or have worked at cross purposes with more compassionate public practices and services designed to assist encampment dwellers.

Like many American cities, Baltimore has struggled to deal with unsheltered homelessness and to create effective and humane policies concerning encampments and the citizens that have little choice but to dwell in them. Over the past decade, the city has had several of these encampments, one of which at the intersection of Martin Luther King Jr. Boulevard and West Mulberry Street west of downtown, is the subject of this paper. How should Baltimore City treat their residents who happen to be homeless and unsheltered? What planning policies and housing solutions can assist the unsheltered homeless in their efforts towards residential autonomy?

This paper examines the condition of unsheltered homelessness in Baltimore and chronicles the lives of ten people who lived in a homeless encampment west of the downtown central business district. It attempts to document and understand their perspectives, in the hopes of informing urban planning practices concerning homelessness and the governance of public space. It aims to reform the policies that treat unsheltered homeless as a public nuisance that must be hidden from the public view. It begins to develop more humane and effective practices that accepts the presence of homeless people in the public spaces of American cities and provides them with the maximum opportunities for comfort, health, safety and respect while also helping them obtain permanent housing and jobs.

This paper argues for Baltimore City to develop more compassionate communication and public health policies for dealing with unsheltered homelessness and existing encampments. City officials should also consider supportive housing solutions that range from temporary to permanent, which can be used to improve living conditions at existing encampments and future sites across the city. While the physical needs of unsheltered residents need to be addressed, their emotional needs cannot be forgotten. Planners can help fulfill these needs through planned and unplanned interactions with the unsheltered homeless.

THE LOCATION OF AFFORDABLE HOUSING AND COMMUNITY DEVELOPMENT ACTIVITY: ARE WE SPENDING PUBLIC MONEY AT THE RIGHT PLACE?

Abstract ID: 362

Poster

TRAN, Tho [Texas A&M University] ductho2211@tamu.edu, presenting author

VAN ZANDT, Shannon [Texas A&M University] svanzandt@arch.tamu.edu, co-author

Formula grants from Department of Housing and Urban Development (HUD) hold a fundamental part in sponsoring affordable housing and community development activities for the low-income population. Since 1995, HUD required the submission of Consolidated Housing Plan as a framework for a community-wide dialogue to identify the priority in receiving Federal supports. This plan is a guiding document for major formula block grant programs including Community Development Block Grant (CDBG) Program, HOME Investment Partnerships (HOME) Program, Emergency Solution Grant (ESG) Program, and Housing Opportunity for Person with AIDS (HOPWA) Program. In the housing literature, there are a handful of studies discussing the spatial issues of housing programs such as HCV, LIHTC, HOPE VI, among others. However, the topic of housing and community development activities covered by Consolidated Housing Plan has not been thoroughly addressed. This research contributes to housing literature by revealing the connection between the concentration of low-income population and spatial distribution of public money spent via housing block grants covered by Consolidated Housing Plan.

Inhering the initial results of the housing plan quality study, the author randomly chooses two cities, from the list of more than 50 cities national wide, for further analysis. The research focuses on two groups of the population. The first one is households with housing problem such as lacking kitchen facilities, lacking plumbing, or overcrowded. The second group is families with severe cost burden. By using the method of spatial statistics and hot-spot analysis, the poster highlights the priority locations for federal support based on the concentration of above population. In addition, each type of Federal support covered in Consolidated Housing Plan is mapped using density analysis. The spatial concentration of CDBG, HOME, and Public Housing activities show where the public money goes. The inconsistency between these maps questions the connection between plan quality and its implementation process. The results also raise serious concerns about the effectiveness of formula block grant programs. Finally, the research expects to trigger a series of discussion between urban planner, researcher, local housing authority, policy maker, and local citizen with the purpose of improving the living condition for people most in need.

MINNER, Jennifer [Cornell University] jm2359@cornell.edu, presenting author

SMALL, Zachary [Cornell University] zjs27@cornell.edu, co-author

PRYCE, Ashley [Cornell University] abp72@cornell.edu, co-author

Historic preservation is only seldom viewed as an ally to community development. In fact, preservation can be viewed as an adversary or gentrifying force in low income communities (Hurley 2010). Nevertheless, ordinary existing buildings are often more affordable than new construction and the continued and adaptive reuse of building stock can be integral to strategies for maintaining affordable housing (Mueller, Hilde, Torrado, 2018) and the incubation of small, local businesses (Minner, 2013; Powe, et al., 2016). Community development corporations, community land trusts, and other community based organizations, often focus on care and rehabilitation of older properties and therefore they share some interests and tactics with historic preservation organizations. While community development and historic preservation groups may have somewhat different strategies, language, and foci, they are not always mutually exclusive.

In addition, grassroots community development and preservation groups most often take an “asset-based” view, focusing on built and social capital within a neighborhood. Both groups have a stake in reinvestment patterns in communities, with a focus on encouraging economic reinvestment in a community’s built environment. Community organizers and preservationists often recognize the risks of too much investment occurring too quickly within a neighborhood, especially if it results in displacement and demolition.

Drawing on community-based research conducted with the Preservation Green Lab, the Preservation Rightsizing Network, and Preservation Buffalo Niagara- including interviews with local community leaders, and spatial analysis- this poster presents the findings of a community-wide assessment of the linkages between historic preservation, community development and social equity in Buffalo, New York. Acknowledging the need to incorporate "people-based" distributive justice and sustainability goals into the "place-based" preservation dialogue, we propose a preservation framework to unite historic preservation and community development planning.

Scholars believe that residents of public housing are one of the most socially vulnerable people that face significant damages in disasters. Public housing residents often cannot afford temporary or permanent shelters after the disasters due to many factors such as lower income and limited access to information that causes a delay in their housing recovery. Therefore, disaster recovery can be very unequal, where some segments of a community are recovering fast whereas other parts, in particular, public housing residents, are lagging behind. To understand and address this inequality, it is important to explore the differences between the recovery of the public housing units and the other housing units in disaster-affected cities with respect to disaster impact, as well as pace and quality of recovery.

To examine these differences in the recovery process, we chose Lumberton, North Carolina's housing recovery after Hurricane Matthew as a case study. Hurricane Matthew hit North Carolina on October 8, 2016, as a Category 1 storm. Several communities including Lumberton were devastated by heavy rainfall and the river flooding that began after Hurricane Matthew. There were four public housing complexes in the city before the hurricane, which contained 839 units. To investigate the disparities between flood impacts and recovery of public housing and the other housing units in the city we employed comparative statistical and spatial analysis using census data and the collected data in our field studies.

Specifically, we used property values of tax data as well as GIS shapefiles of residential properties in Lumberton. Social vulnerability factors including race, income, poverty, age, education, and housing tenure of the residents at Block Group level were collected from the 2015 ACS-5-year estimation. We used these statistics and spatial analysis to map the social vulnerability of the city. Then, the map was overlaid with public housing complexes locations. Also, data on home damages, recovery resources, decisions, and dislocations were collected using two longitudinal field study surveys conducted in December 2016 shortly after the flooding, and January 2018 one year after the disaster. Therefore, the impact of social vulnerability factors on the damages and the pace and quality of the recovery of public housing units were investigated in comparison with other housing units in Lumberton.

Based on this analysis, social vulnerability hotspot maps were produced. Preliminary findings show that social vulnerability factors including housing tenure, race disparities and incomes below poverty of public housing complexes are greater than the other segments of the city. Thus, these complexes faced severe damages in Lumberton after the flooding. Moreover, the recovery pace of these units and their neighborhoods is slower than the other parts of the city partly due to their greater number of abandoned units. Finally, this poster provides suggestions to help make public housing units and their residents to be more resilient towards similar natural hazards in the future.

RESIDENTIAL LOCATION CHOICES OF MILLENNIALS – EVIDENCE FROM THE CHICAGO URBANIZED AREA

Abstract ID: 530

WANG, Yiyuan [University of Illinois at Urbana-Champaign] yiyuanw2@illinois.edu, presenting author
LEE, Bumsoo [University of Illinois at Urbana-Champaign] , co-author

After more than half a century of massive suburbanization, the central cities of the largest metropolitan areas in the U.S. have grown faster than their suburbs. Mirroring this development, car ownership and driving have also shown a decline after decades of constant growth in automobile use. While many journalists and researchers cheer this potential “urban revival” driven by the Millennial generation, others view the uptick in urban growth as transitory. Skeptics believe that Millennials' seemingly unique location and travel choices are merely an outcome of their economic struggles and delayed lifecycle events (Myers, 2016; Manville et al., 2017). However, if the urban concentration of Millennials is largely lifestyle-driven, especially with respect to their mobility and location preferences, we can expect to see sustained re-urbanization of a kind supported by a more sustainable multi-modal transportation system in the coming decades (Davis et al., 2012; McDonald, 2015; Couture & Handbury, 2016). What are primary location factors that attract Millennials to urban neighborhoods?

This research investigates location choices of the young adult population in the Chicago Urbanized Area for the period of 2006-2015, utilizing a unique mobility dataset, the Info USA Historical Consumer database. This dataset allows us to do an individual household level analysis with fine scale residential location information both before and after their moves. We conduct a series of multinomial logit regression analyses to test several competing hypotheses regarding Millennials' location preferences. We test various location factors including: physical characteristics of the built environment (i.e., density, street connectivity, and land use mix), access to alternative transportation modes (i.e., walking, biking, and public transit), and consumption amenities (e.g., cafes, bars, and cultural facilities) as well as job accessibility, housing market conditions, and other demographic attributes of the neighborhood.

PLACE-MAKING IN THE WAKE OF LIGHT RAIL TRANSIT (LRT): A CASE STUDY FROM SOUTH PHOENIX

Abstract ID: 599

Poster

TZIGANUK, Ashlee [Arizona State University] atziganu@asu.edu, presenting author

In 2016 the United States Census Bureau reported that 80 percent of the U.S. population resides in urban areas (2016). As more and more people choose to live in urban areas, cities must find ways to adapt to and support growing, diverse populations. Part of this adaptation involves increasing the use of transit systems like light rail transit (LRT). LRT, often referred to as streetcars or trams, offers a variety of potential benefits and drawbacks to urban communities. Firstly, light rail an increase human mobility and access to services for those who may not be able to afford a car or who cannot drive (Topalovic et al. 2012). In addition, access to LRT can increase overall

community health, environment, and connectivity, as well as increased transit oriented development and economic development (Topalovic et al. 2012).

However, such beneficial development can lead to an increase in property values, which can displace original community members and cause gentrification (Dziauddin et al; Campbell and Reuter 2008; Kahn 2007). Though bountiful research exists on the benefits and drawbacks of LRT on urban communities, many focus on objective indicators such as housing prices and economic investment to determine its success. A large gap exists in the literature regarding community stakeholder voices. Understanding how members of the community feel about LRT in their community is an important missing piece of the puzzle, especially for social equity issues (Ferbrache and Knowles 2017).

The purpose of this study is to shed light on how LRT development impacts communities that are often ignored in the literature. Thoughts on the benefits and drawbacks of LRT in South Phoenix, and how the community is actively (or indirectly) responding to it, was acquired using semi-structured interviews with the likes of residents, business owners, neighborhood groups, and planners. The case study takes place in South Phoenix, a historically Latino and African American neighborhood, where the Phoenix Metro light rail is to be expanded by the year 2023/2024.

This general area of Phoenix has been described as a ‘hazardscape’, due to the presence of environmental contamination by industry and waste sites, and the unwelcoming traffic from freeways and above flight paths (Bolin, Grineski, and Collins 2005). This case offers a unique perspective on how communities that have been previously marginalized by government and Anglo outsiders preemptively prepare for LRT development in their neighborhoods. Expected findings include that the South Phoenix community will have mixed opinions on the light rail extension, and that their reasoning will be centered around areas of economic development, displacement, and gentrification. In terms of community action, it is expected this community will be highly active in the place-making process surrounding the light rail extension, primarily via community groups and committees, and vocal participation in official meetings. This research serves as a relevant example of how planners need to include community voices in top-down planning projects, especially in historically marginalized communities.

ASSESSING BENEFITS OF ARTS AND CULTURAL ORGANIZATIONS TO SINGLE-FAMILY PROPERTY VALUES: A SPATIAL HEDONIC STUDY IN CINCINNATI, OHIO

Abstract ID: 815

Poster

WU, Yue [University of Cincinnati] wuy9@mail.uc.edu, presenting author

Recently, promoting cultural industries has become a popular strategy to stimulate city redevelopment (Murdoch, Grodach, and Foster, 2016). By attracting and supporting arts and cultural organizations (ACOs), small retail, and service businesses, the strategy is expected to generate city revenue, transform blighted urban spaces, and develop

urban identity (Markusen, 2013). Research shows that ACOs have positively contributed to city image branding, resident attraction and retention, and brownfield redevelopment (Evans, 2005).

Questions. Although housing prices act as an index to quantitatively measure the attraction of a neighborhood, we have few, if any studies to address the effects of ACOs on residential property values. This analysis seeks to fill this research gap by investigating two questions:

(1) Do ACOs have a positive impact on residential property values?

(2) If so, what type of neighborhood would benefit most from the introduction of ACOs?

It is hypothesized that there is a positive relationship between single-family property values and the number of ACOs within walking distance (5 and 10 minutes).

Methodology. The study area of Cincinnati, a rust belt city in the Midwest, had started to fund local ACOs as part of its community development strategy since 1989. The fund, The City of Cincinnati Arts Allocation, applies 0.14 percent of its General Fund to support of the Cincinnati-based artists and arts and cultural organizations of all sizes. Utilizing property transactions data from Cincinnati Area Geographic Information System (CAGIS), business data from the Infogroup Historical Business Dataset, as well as census data, this paper develops a spatial approach to the evaluation of the effect of ACOs on housing prices. This study implemented three models based on hedonic pricing modeling: a standard hedonic model, a spatial lag model, and a spatial error model. To spatially illustrate the results, this study further used a Geographically Weighted Regression (GWR) function in ArcGIS to identify those areas that would benefit most from ACOs.

Findings. The results show that by controlling lot size, number of bedrooms, year built, distance to the nearest highway exist, as well as community median household income, all three models confirmed the hypothesis that the numbers of ACOs within 10 minutes walking distance are positively significant for single-family property values. This research also found that by controlling spatial autocorrelation, the spatial lag model effectively increased the accuracy of the coefficient estimated by the standard hedonic model. Thus, this research concludes that ACOs do have a significant impact on the prices of surrounding single-family properties. Application of the GWR pointed to three different lower income riverfront neighborhoods having the highest coefficients, suggesting the possibility that increasing the number of ACOs in these neighborhoods might increase single-family property values much more than the other areas in the city. However, the sample size of high impact areas identified by GWR is too small. Thus it is too early to make a conclusion about the common features of these areas.

Implications. For decision makers, the finding that the number of ACOs matters in the single-family property values highlights the need of supporting ACOs in cultural led revitalization strategy. More specifically, by pointing out the high impact areas in the city, urban planners can make a better ACOs promoting strategy in Cincinnati. My further studies will extend the study objects to multi-family properties and apartments, and include a longer period property transactions data to build up a more reliable sample size.

NEIGHBORHOODS AS COMMUNITY ASSETS: THE ROLE OF NARRATIVE IN PROTECTING GENTRIFYING NEIGHBORHOODS

Abstract ID: 842

Nationwide, cities are experiencing a resurgence as suburbanites and businesses return to vibrant urban scenes. Neighborhoods are assets and sources of stability for these cities. However, during periods of rapid change, maintaining neighborhood stability may be difficult. Gentrification is a type of neighborhood change, which may contribute to residential instability that may lead to weakened social cohesion (Mennis et al. 2013). Existing neighborhoods, particularly those in decline, are ripe for reinvestment and are not always viewed as distinct places. A neighborhood's perceived placelessness may be linked to a lack of narrative.

For neighborhoods without a narrative, how can a meaningful narrative be created that communicates the neighborhood's importance and necessity as an asset to the city at-large? Existing literature on neighborhood narratives involves an analysis of existing narratives (Blokland 2009; Ocejo 2011). Close examination of neighborhood narratives shows how neighborhood culture is developed and maintained over time. These narratives convey the norms, beliefs, values, and future vision of the neighborhood, often from the perspective of gentrifiers. Narrative and storytelling is also discussed as a planning method (Sandercock 2003; Van Hulst 2012). The role of narrative in planning is often overlooked as a resource for formulating policy, creating local knowledge, and critically examining the context of planning issues. Within both of these lines of research, existing narratives are analyzed and evaluated rather than created. Further research is needed into the creation of narratives through a participatory planning process.

Against this background, the purpose of this study seeks to answer the research question: How can planners work with a neighborhood to create a narrative that aims to create social cohesion and empowerment, while also communicating the neighborhood's importance to the city as a whole? More specifically, this research has two objectives: 1) to develop a model for the creation of neighborhood narratives; and 2) to explore the value of narratives in building the capacity of neighborhoods to participate in the planning process.

Using Porters, an historically African American neighborhood in Gainesville, Florida, as a case study, we respond to the research question, with a participatory planning approach. Our participatory "neighborhood narrative" approach documents the Porters neighborhood as an asset to the city in three phases. The first phase of study involves the use of qualitative and quantitative methods create a neighborhood profile in order to understand the past and present neighborhood conditions, including the extent of neighborhood change. Interviews, oral histories, and community engagement activities are used to understand and situate the Porters neighborhood into the context of the surrounding city. In the second phase, we work with a Steering Committee to identify neighborhood assets and formulate the neighborhood narrative. In the third phase, we test the narrative with neighborhood groups and outsiders in a focus group format.

The resulting neighborhood narrative articulates the future vision for Porters. Further, the narrative illustrates the importance of the neighborhood for residents and the Gainesville community as a whole. Our research also demonstrates that the "neighborhood narrative" approach establishes a foundation from which the neighborhood can participate in the planning process. Through the narrative, the residents have the capacity to initiate the necessary planning policy changes. The findings from our study illuminate the complexity of creating

a neighborhood narrative in the face of gentrification pressures, both real and perceived. The study also demonstrates the continued need for planners to engage in supportive neighborhood planning processes to strengthen neighborhoods threatened by redevelopment and displacement.

DETERMINING MULTIFAMILY RENT IN SPATIAL AND SUBMARKET CONTEXT

Abstract ID: 897

Poster

PENG, Qiong [University of Maryland, College Park] xqpeng@umd.edu, presenting author
KNAAP, Gerrit J [University of Maryland, College Park] gknaap@umd.edu, co-author

It is well known that investments in light rail transit can lead to increases in housing prices and rents with the potential to displace low income residents and lower transit ridership. For this reason, the National Center for Smart Growth (NCSG) at the University of Maryland led the development of the Purple Line Community Development Agreement (PLDA) recently signed by the Executives of Prince George's and Montgomery Counties, the President of the University of Maryland, and a host of other stakeholders and interest group. Foremost among the goals of that agreement is the goal of assuring that housing in the corridor remains affordable for residents of all income levels. As part of its commitment to the PLCA, the NCSG committed to developing a Purple Line Dashboard designed to track a wide range of variables including housing prices and rents. The signatories of the agreement committed to reviewing the data posted on the dashboard on an annual basis to monitor progress toward the completion of the goals.

In this paper we present the Purple Line Real Estate Information tool that is part of the Purple Line Dashboard. This web-based tool presents data on housing prices and rents throughout the Purple Line corridor. The tool includes detailed information on a variety of real estate variables including rents for multifamily units and a variety of attributes such as number of bedrooms, construction quality, school quality, code violations, distance to various attributes, including light rail stations, and more. To gain deeper insights into the performance of the multifamily housing market over time the tool uses information from a hedonic price model that uses multifamily rents as a dependent variable. This hedonic is performed using very high quality rent data provided by the county and advanced statistical techniques, such as spatial hedonic regression. The paper concludes with lessons learned about how to design real estate information systems to promote equitable development in new, light rail corridors.

MIXED-INCOME HOUSING, IS IT FAILURE OR SUCCESS? A REVIEW OF THE LITERATURE

Abstract ID: 973

Poster

YANG, Aram [Ohio State University] yang.4201@buckeyemail.osu.edu, presenting author

Mixed-income housing has been adopted as a new approach to remedy distressed public housing and to provide affordable housing. The HOPE VI program was one of the federal housing policies to utilize income mixing as a strategy to deconcentrate poverty. The Choice Neighborhood program continues to adopt mixed-income housing with a focus on neighborhood revitalization. However, evaluations about the mixed-income housing practices show mixed results. The two main justifications directly related to poverty alleviation are ‘social capital improvement’ and ‘role modeling’ for the relocated public housing residents. The research results indicate that the assumed impacts did not happen and thus show the necessity of revisiting the theoretical justifications of mixed-income housing policies. Therefore, this study examines the previous literature about mixed-income housing practices for clarifying the different interpretations that are used to determine success or failure of mixed-income housing. The mixed results of previous studies originate from different expectations and broad definitions of mixed-income housing. While studies mainly focusing on neighborhood impact show ‘success’ of mixed-income housing, studies about benefits for low-income population indicate ‘failure’ of the developments. The varied research results indicate that poverty alleviation may not be ideal for theoretical justification of income mixing. Thus, this study recommends further research about examining expectations about mixed-income housing. In addition, further research needs to address whether mixed-income housing policies without the justification of poverty alleviation can be supported as a tool for affordable housing. If the poverty alleviation justification is not necessary, further research is required to examine why the mixed-income housing policies should be supported. This study will help to build clear expectations about mixed-income housing developments and thus improve the future practices.

EXPLORING BARRIERS/DRIVERS IN LOCAL BUSINESS PARTICIPATION IN DOWNTOWN REVITALIZATION

Abstract ID: 1011

Poster

There has been growing concern over the state of small towns in America as they suffer from outmigration and growing lack of social and economic vitality. One approach to addressing these challenges is creating social space and improving quality of life through downtown revitalization. Yet, over the last decade, especially subsequent to the Great Recession, community development initiatives have experienced even greater decreases in public funding than in previous years (Beckendorf et al., 2014). Diminishing government involvement combined with changing economic conditions have created challenges for rural downtown redevelopment. Despite these challenges, some small communities remain vibrant places, attractive to residents and visitors alike, by leveraging their physical, cultural, and economic assets and investing in a community-based vision, strong local leadership, cross-sector collaboration, attractive streetscapes, and effective marketing (HGAC, 2015).

In recent research conducted by the authors of this study, in which they explored downtown redevelopment of one rural community in Virginia, interviews with communities across the state highlighted leadership of local businesses as a vital ingredient for downtown revitalization. Previous literature also cited these factors in addition to discussing motivations of local businesses and other entities for investment in downtown revitalization efforts. Mowery (2015) highlighted that in bigger cities such as Spokane, WA, many public entities and developers tend to rely on a neoliberal paradigm in which their activities are more or less determined by economic returns for the services offered. However, only few authors explore the motivation and challenges/drivers to participation by local businesses in smaller cities and towns, in a rural setting. For this research, we ask: (a) Why do local businesses engage in downtown revitalization efforts? and (b) What are the practical barriers and drivers for businesses to engage in downtown revitalization?

To answer these questions, we used the case of Christiansburg, Virginia and its downtown revitalization process. Christiansburg, Virginia can be a particularly useful example, as it is emblematic of many small towns in middle America. Christiansburg is a small town, with a population of 22,000 (Social Explorer Tables, 2016). Like many small towns, it has a declining and aging rural population, and has experienced losses in manufacturing and other industry employment. Due to these factors and the rise of big box stores, its once vital downtown in the early 20th century became remote and empty. Now, in an effort to create more public space, improve the overall quality of life, and promote small business growth, public and private entities in the community wish to foster opportunities for the downtown and surrounding neighborhoods.

This study used a three-step methodology to address this topic. We first identified the local businesses situated in downtown Christiansburg by using GIS tools and surveying the downtown area. Next, we narrowed this list to ten local businesses most frequented by community members and interviewed those businesses to understand their perceived role and existing levels of engagement in downtown revitalization. Interviews were semi-structured, allowing for open discussion and deep probing into the challenges and opportunities for business participation in these efforts. Interviews were then qualitatively assessed to draw inferences.

With a growing interest in small downtown revitalization, this study provides important findings to downtown organizations in understanding various drivers/barriers that strengthen/hamper the engagement of local businesses in downtown revitalization. Furthermore, this research strengthens the findings from the previous literature on the importance of local businesses in downtown revitalization and expands on findings that examine businesses' underlying ontologies that inform their engagement in these activities.

MONETIZING HEALTH IMPACTS OF THE BUILT ENVIRONMENT: MATCHING LONGITUDINAL HEALTH CARE UTILIZATION AND COST WITH LAND USE AND TRANSPORTATION CHARACTERISTICS

Abstract ID: 1031

Poster

FRANK, Lawrence [University of British Columbia] lawrence.frank@ubc.ca, presenting author
HONG, Andy [University of British Columbia] andyhong@gmail.com, primary author

Central theme or hypothesis:

There is growing recognition that health costs are associated with transportation investments and land-use decisions. Improvements in the built environment are associated with increases in physical activity, lower obesity rates, and diabetes incidence, all of which lead to considerable health benefits (Creatore et al. 2016). Conversely, sedentary time spent in cars is associated with higher obesity rates and lower levels of physical activity (Frank, Andresen, and Schmid 2004). Research has linked active transportation with lower risk of cardiovascular disease (Sallis et al. 2012) and with mortality rates (Park and Sener 2017; Woodcock et al. 2011). A recent study has further estimated a monetary value to the treatment of various chronic diseases as a result (Yu et al. 2017). However, no study to date has simultaneously examined systematic relationships between built environment characteristics, activity patterns and obesity, and health care utilization and costs in a single sample.

Approach and methodology:

This study evaluates relationships between detailed built environment features, transportation infrastructure, and physical activity on disease outcomes and healthcare costs with the BC Generations, a cohort study of nearly 13,000 participants in British Columbia, Canada. This study links built and natural environment features with travel patterns, physical activity, and attitudinal and preference data with health care utilization and cost data from the British Columbia Medical Services Plan (MSP).

Findings:

Our findings indicate positive relationships between neighborhood walkability and transport-related walking and physical activity and inverse relationships with obesity, diabetes, and cardiovascular disease. Preliminary results suggest that health care utilization and costs are inversely related with walkability and regional accessibility; but relationships vary considerably across demographic subgroups.

Relevance to planning scholarship, practice, or education:

Results from the proposed study provides evidence that support the inclusion of health related costs into transportation cost-benefit models used to assess alternative transportation funding options. Findings suggest that certain modifications to the built environment will promote quality of life and reduce the economic burden of disease.

ACCESSORY DWELLING UNITS: A NEW PERSPECTIVE, FROM THE DWELLER'S MOUTH

Abstract ID: 1068

Poster

KIDRON, Yael [Toulan School of Urban Studies and Planning, Portland State University] ykidron@pdx.edu, presenting author

In recent years, there has been growing interest in accessory dwelling units (ADUs). ADUs offer a self-contained living area, including a kitchen and bathroom, located within the walls of an existing home or a freestanding structure on the same lot as the main housing unit. ADUs are known by many different names, offering insight into prevalent uses and perceptions of such units, including secondary dwelling units, granny flats, in-law units, guest houses, backyard cottages, garage apartments, or carriage houses.

Accessory dwelling units have become a widespread contemporary tool for urban infill (Chapple et al 2011) in recent years. The significance of ADUs lays in the fact that their implementation is mostly done by the single private homeowner and the unit often uses existing infrastructure on site, creating infill development. Lee King (2012) attributes current heightened interest and research regarding ADUs to cities undergoing housing shortages and increased demand for rental housing. ADUs, as a tool for urban infill provides an opportunity to include more members into the fabric of an existing community.

Wegmann and Nemirow (2011) suggest smart growth advocates see directing growth to infill locations as an opportunity to preserve open space as well as reduce traffic congestion, air pollution, and energy use. Duff (2012) adds, that through the use of ADUs, an existing city could accommodate a great deal of the population growth with increased density rather than the construction of new single-family homes.

The city of Portland, Oregon in an effort to encourage the development of ADUs, has been running a System Development Charges program for nearly a decade and has also scrapped any need for creation of further parking on site (a common barrier to building ADUs in other cities).

In 2017 the Institute for Sustainable Solutions at Portland State University carried out a city-wide survey research headed by Prof. Matthew Gebhardt. In this research owners, prospective owners, and ADU dwellers addressed questions ranging from financing to shared-use, neighborhood effects to travel behavior etc.

While past research regarding ADUs has focused solely on the perspective of the owner(s) of the unit, rather than the user(s), this subset of the research offers a different perspective at addressing this contemporary phenomenon, that of the ADU dweller. By examining the population who live in ADUs we, as planners, can gain a better understanding of housing preferences, choices, and needs and address current shortcomings and barriers to creating more efficient and possibly more equitable units.

The questions this research aims to answer include identifying what market(s) is the ADUs model addressing? How does living in an ADU compare to other rental housing? And What can we learn about shared spaces and neighborhood effects of ADUs?

Early findings suggest that residents of ADUs are younger than the general population. Furthermore, the vast majority of residents accounted for having no children (under 18) living in the unit, and over half of respondents reported only one adult was currently occupying the ADU.

Over 40% of ADU residents have lived in their current neighborhood for less than 1 year. Accordingly, reported neighborhood activity is low, the most frequent activity is participating in community events. Nevertheless, the top two reasons for choosing to live in an ADU are cost of living and the neighborhood.

Shared spaces are common, the most frequently reported shared use of a yard, while shared utilities with the main house came at a close second. We asked about the importance of sharing facilities, 70% of respondents claimed access to shared space had not been a factor in choosing to live in an ADU.

LOW INCOME HOUSING TAX CREDIT AND TRANSIT ACCESS: A CASE STUDY OF TEXAS CITIES

Abstract ID: 1320

Poster

AZHAR, Awais [The University of Texas at Austin] awais.nca@gmail.com, presenting author

The Low Income Housing Tax Credit program (LIHTC), is an integral means of creating and preserving affordable housing throughout Central Texas and the United States. Efforts have also been made to link LIHTC housing to public transit to reduce resident transportation costs and address affordability concerns. State Housing Finance Agencies (HFA) guide project selection through a Qualified Allocation Plan (QAP). Several states use this process to incentivize locating LIHTC housing in close proximity to transit, including the State of Texas. However, research, has shown that the likelihood of transit stations being located in neighborhoods with existing affordable housing is greater than the likelihood of affordable housing units being located near existing transit stations. Furthermore, new LIHTC projects that are located near transit stations are often found in lower-opportunity neighborhoods. This study uses ArcGIS Network Analyst tools to assess the connectivity of LIHTC projects in Texas cities to major job centers via existing public transit. The use of the OD cost matrix analysis is used to measure the time it takes residents living in LIHTC projects to nearby job centers using transit. This data is then mapped with indicators related to opportunity, including poverty and income, to assess travel times in relations to these indicators. The results of the study can help assess whether State of Texas QAP goals of connecting LIHTC projects to transit networks are being achieved in these cities and leading to equitable transit access.

ROLE OF PHILANTHROPIC ORGANIZATIONS IN OFFERING PHYSICAL ACTIVITY RELATED PROGRAMS ADDRESSING HEALTH DISPARITIES IN THE SAN FERNANDO VALLEY

Abstract ID: 80

Lightning Research Presentation

TOKER, Zeynep [California State University, Northridge] ztoker@csun.edu, presenting author
CHAUDHARI, Lisa [California State University, Northridge] lisa.chaudhari@csun.edu, primary author

Research shows that cultural elements (such as emphasis on family) might explain the substantially lower levels of physical activity among Latinas (D'Alonzo 2012, Benitez et al 2016, Eyler et al 2002). However, examples of culturally sensitive public health services to improve physical activity levels are limited.

The purpose of our study was to understand the availability and nature of such services in low socioeconomic status (SES), high minority communities in the San Fernando Valley – accommodating about half the population of Los Angeles.

We identified 1580 nonprofit organizations and 1356 other entities (such as schools, recreational centers, parks, churches, etc.), which potentially provide services to improve physical activity in the San Fernando Valley; and contacted those located in high diversity low SES neighborhoods (13% and 37% respectively) with response rates of 7% and 10%. We asked about the nature of services they provide and their target population.

We conducted unobtrusive observations to document the physical activity related services provided by two of those organizations and entities. We also conducted expert interviews to understand how they identify the need and nature of such services.

The outcomes of our interviews and observations support that a variety of physical activity related services was offered to target specific groups in the community. For example, a weekday late afternoon workout session was offered for parents of an afterschool program participants at that time.

Given the suggested emphasis on family in Latina culture in the literature, targeted scheduling of activities is potentially a successful intervention strategy to improve physical activity.

EXPERIENCING COLLABORATIVE HOUSING. A COMPARATIVE UNDERSTANDING OF RESIDENTS' VALUES AND RATIONALES WITHIN COMMISSIONING CONFIGURATIONS.

Abstract ID: 545

Lightning Research Presentation

BOSSUYT, Daniel [University of Amsterdam] d.m.bossuyt@uva.nl, presenting author

Self-organized production of habitat is a major urban trend, attracting attention from policy and academic circles alike. (Fromm, 1991; Mullins & Moore, 2018; Tummers, 2016). The term collaborative housing is used to refer to a wide variety of self-organized housing initiatives, including self-build housing, co-housing, co-operatives and other forms of collective resident-led housing, all characterized by a high degree of user participation in production. Active user involvement in housing production is welcomed as a way of stimulating housing supply, diversifying housing stock and providing housing that is more attuned to the needs of an increasingly diverse society. Collaborative housing has been celebrated as a positive alternative to turn-key housing production and a means of increasing citizen control over the production of urban space as a whole.

A starting premise is that, while self-building is imbued with discourses of self-sufficiency, freedom and autonomy, residents must negotiate and interact with other stakeholders in the realization of collaborative housing initiatives. External stakeholders are instrumental in overcoming challenges related to knowledge and resources, such as land or financing. The division of responsibilities and relations between residents and stakeholders crystallizes in the form of different commissioning configurations. Amongst the less studied aspects of collaborative housing is the degree to which resident participation is enabled or constrained within different commissioning configurations. This is relevant given that this has strong implications for the potentials and merits of collaborative housing with respect to housing affordability and meeting residents' needs.

To contribute to our understanding of collaborative housing this paper proposes a comparative comparison of the rationales and social values held by residents, as well as the degrees to which residents have been to realize these within different types of commissioning configurations in practices of collaborative housing. It seeks to understand how, under varying commissioning configurations, residents navigate their aspirations in relation to housing process and form. In order to do so, the paper takes on a conceptual social constructionist approach that underlines the meaning given to housing in procurement and materiality. We expect that collaborative housing can be best understood through interrelated motives of asset accumulation, cost-saving and varying degrees of collectivization and individualization motives, dependent on the commissioning configuration.

Empirically, the paper draws on semi-structured in-depth interviews conducted with resident-builders of the Homerus neighborhood in Almere, the Netherlands. Here, resident-led production of housing and neighborhood facilities has been the cornerstone of the development of a mixed-use, urban neighbourhood on greenfield land. It is particularly innovative through its mix of types of collaborative housing, as well as its affordability scheme for lower and middle incomes. Since 2006 a total of 1600 housing units have been realized through self-organized housing production. For this paper, a total of 45 interviews have been conducted with residents of three different types of collaborative housing: individual, collective and co-housing in conjunction with developers.

The paper is valuable in particular in terms of its comparative perspective on self-organized housing practices, linking the micro-level of residents' experiences with the meso-level of stakeholder collaboration. Through this, it does not only scrutinize the experiences, rationales and values of collaborative housing residents, but also highlights the repositioning of actors' positions in housing provision and changing relations between state, market and civil society.

FRAMING HOUSING DENSITY IN CONSERVATIVE SETTINGS

Abstract ID: 940

Lightning Research Presentation

DAVISON, Mark [University of Florida] davison.mark@ufl.edu, presenting author

The need for framing local planning policy in response to the existence of multiple publics and special interest groups is well established. A common hot-button issue is housing density. Political ideology contributes to the contested way housing density is publicly debated (Lewis & Baldassare, 2010). Political affiliation causes people to align with the members of their political circle without considering the broader implications. Members of the public rarely base their perception of planning policy on rationalist principles (Baum, 2012); rather gut feelings and impressions can sway policy makers (Lewis, 2014).

Partisan voices in the local decision-making process link political ideology to policy language, and as a result, impact the discourse through emotions and value-laden language (Bassett, 2009). In many cases, the discourse is unresolvable by an appeal to facts (Schön, 1979).

However, an effectively leveraged approach to communicative planning, based on the underlying predispositions of a group (Healey, 1996), offers a more productive means to discussing the planning and policy implications of density guidelines. Understanding the prevailing narratives and frames of reference conservatives hold, before entering discourse concerning density goals, is more complicated than presenting empirical facts, or simply describing the viewpoint of the planner.

This project uncovers the prevailing narratives and frames of reference concerning housing density in the highly conservative Mississippi Gulf Coast region. Following Hurricane Katrina, Governor Barbour inaugurated the Mississippi Renewal Forum. The forum brought together hundreds of planners to re-imagine the region's eleven coastal cities along the principles of New Urbanism. Since that time, eight of the eleven cities have adopted comprehensive plans that address housing density with varying degrees of adherence to the concepts of compact development and increased density.

This project attempts to specifically answer the following questions:

1. What commonalities do the adopted plans share regarding housing density?
2. How do the plans represent housing density through language?
3. How do self-described conservatives respond to common phrasing, descriptions, and frames of reference regarding housing density?
4. What ways of describing and framing density are most conducive to agreement and acceptance by self-described conservatives?

Findings are based on the results of four interrelated questions and grounded in the textual analysis of the language contained in adopted planning documents; on the results of public opinion surveys submitted to members of the Jackson, Harrison, and Hancock Counties Mississippi Republican Party; and the results of coded interviews with conservative leaders in the region.

If concepts taken for granted as sound practice by planners ignite social, cultural, or political stress in the minds of citizenry, and only results in greater conflict, then planners need to understand why it happens, and how those tensions can be minimized or removed. Donald Schön (1979) described this as the act of policy setting. Reconceptualizing policy is the act of demonstrating the meaning of policy through a wholly different set of ideas (Lackoff, 2005). The meanings expressed and interpreted through language by those on differing positions of the political spectrum can vary substantially, and often leads to misunderstanding, stalled debate, and conflict in the participatory process. Framing housing density in a language that can be “heard” by conservatives is vitally important to developing long-term solutions to the pressing problems of affordability and sustainability.

POLICY, PREFERENCES AND PRACTICALITY: AN INVESTIGATION INTO MILLENNIAL HOUSING CHOICE

Abstract ID: 1292

Lightning Research Presentation

VOLKER, Jamey [University of California, Davis] jvolker@ucdavis.edu, presenting author

In North America, between 15 and 20 percent of all urban (non-rural) households move in any given year. But how do they decide where to move? What locational and housing attributes do they prefer? Which do they consider in choosing a new home? And how do those decisionmaking processes and factors differ across different types of households? Answers to these questions are critical to understanding housing market dynamics, meeting housing demand and informing policy efforts to increase urban – and suburban – residential densities and reduce household vehicle miles traveled (VMT).

In the United States, the available evidence indicates a decreasing demand for large-lot homes and an increasing demand for small-lot homes, townhouses and multifamily units in transit-accessible urban areas. The shift in residential location preferences results in part from, and will likely continue to be aided by, changing demographics. For example, millennials have a stronger preference for neighborhood walkability, a greater interest in living in urban locations than other types of neighborhoods, and greater support for and a greater willingness to live in smart growth communities than any other age group.

However, this is not necessarily a simple “build it and they will come” situation. Stated preferences are often not acted on, and therefore are not an accurate proxy for actual housing demand. But if stated preferences cannot be trusted to accurately inform land use planning, housing policy and real estate development plans, then what can? How do millennials actually decide where and in what type of house to live? What factors are most influential to them? And how can policy and marketing impact them? Planners everywhere are asking these questions, because millennials – who, with more than 80 million people, now outnumber the baby boomers – are expected to dominate the demand for new housing in coming years.

My study will explore these questions through at least 30 in-depth interviews of millennial couples in California and Arizona who just recently bought and moved into a new house. My interview-based study will improve our understanding of the “why” and the “how” of household’s residential location choices, and develop a “greater understanding of the heuristics, biases, and other non-economic motives that might drive consumer choice in the housing market” (Reid, 2013, 3). My results will enrich the currently predominating life-course theory, and help fill the significant gaps in the literature about the extent to which residential location decisions are actually guided by “attitudes and lifestyle preferences,” as most “current research relies on a priori assumptions about households’ motivations for choosing where to live” (Lund, 2006, 358). They may also assist policymakers and developers in tailoring their policies and developments to attract households to the lower-VMT urban areas.

NORONHA, Kimberly [University of Pennsylvania] knoronha@design.upenn.edu

Informality has been called the dominant mode of urbanization in the 21st century. It manifests itself in the rapidly expanding cities in the Global South in the form of informal settlements, informal transit, informal livelihoods, and informal political practices. There has also been increasing attention to informality in the cities and institutions of the Global North. Research on urban informality in planning and related disciplines has exploded in recent years.

Yet the term 'informality' itself is both murky and contentious. There has been little agreement on how to define informality, let alone how urban plans and policies should respond to it. The tools of planning, even planning that attempts to be inclusive and participatory, are often inapplicable where informal practices dominate. Some question the need for planners to 'formalize' the informal, while others argue that lack of state recognition hinders attempts to provide welfare to the poor. Some argue that 'informality' is not a useful conceptual category at all, and that the designation simply stigmatizes the urban poor and perpetuates unequal power relations.

Community organizations play a critical role in disaster recovery owing their ability to motivate volunteerism, assess local needs and distribute goods and aid.[1] But few such organizations have the capacity to successfully navigate the dynamism and uncertainty of the disaster recovery process. Networking and communication can provide these organizations with new avenues of information and action[2], boost their diminished capacities, provide better means of community representation, and improve “cognition” of “emerging risk to which a community is exposed and to act on that information”[3]. Evidence also suggests that neighborhoods that undertake social networking may be better able to respond to disasters because it facilitates information exchange, collective action, and access to new resources for recovery.[4]

This roundtable will analyze the benefits of inter-organizational communication between community organizations for local recovery. Participants will share and discuss their experiences to examine the ways and means in which inter-organizational communication improves post-disaster recovery efforts of community-based organizations. Participants will present examples from recovery efforts in Kobe, Gujarat, Indonesia, India, Japan, Trinidad, Tobago, Haiti, Turkey, Nepal, New Orleans, New York, Houston, Florida, and Puerto Rico.

PRE-ORGANIZED SESSION SUMMARY **SPATIAL POLITICS AT THE LIMITS OF THE URBAN**

Session Summary: 27

Abstract ID: 319

Abstract ID: 321

Abstract ID: 1167

Abstract ID: 1365

This panel brings a Global South urban design and planning perspective to spatial politics research. Immersive research, drawing from the experiences of those at the limits of cities and government services, pushes against a territorial-only rendering of spatial politics. In so doing, the panel emphasizes the on-the-ground political stakes of urbanization processes and the value of looking outside, anew, and beyond the spaces that have been central to the theoretical formulation of dominant notions of urban theory. We argue that emerging political, economic, and ecological shifts are creating new spaces, relationships, and modes of contestation--particularly in cities of the Global South. With research situated in India, Indonesia, Lebanon, and Rwanda we ask: How do the dominant forms and mechanisms of making cities, and marginal approaches to constructing alternative places of belonging, reveal the range of spatial politics at work in urbanization today? How do these spatial politics recast urban limits and articulate alternative conceptual frames for the analysis of power, development, labor, and conflict?

Objectives:

- Understanding land politics surrounding planning interventions in cities in the global South

PLANNING WITHOUT DEVELOPMENT

Abstract ID: 319

Group Submission: Spatial Politics at the Limits of the Urban

BOU AKAR, Hiba [Columbia University] hb2541@columbia.edu, presenting author

This paper traces the tenuous relationship between development and planning discourses (Yiftachel, 1998; Beauregard, 2001; Roy, 2002), highlighting the corresponding shifts in approaches to the ordering of territories over time as they played out in Beirut, Lebanon. I explore how these shifts intersected with the temporalities of war and conflict that rocked Beirut since the emergence of Lebanon as a post-colonial state in the 1950s. The paper illustrates how these shifts in logic coincided with global moments of anxiety around communism, and later, political Islam (Rostow, 1990; Hart, 2010). It shows how spatial practices were eventually transformed through militias' and religious-political organizations' spatial interventions into a collection of innovative design and planning exercises aimed at balancing the spatiality of a sectarian order. I propose that this shift in the approach of planning from the quests and questions of development centered on issues of poverty to an exercise in spatializing sectarian difference changed the discourse around Beirut's southern peripheries from that of informal and poor peripheries to sectarian frontiers. The paper illustrates how this reformulation of the political consciousness vis-à-vis the periphery, its economy, marginality, and inhabitants has had major repercussions on poverty, segregation, violence, and environmental degradation.

URBAN WATERSCAPES: THE HYDRO-POLITICS OF FLOODING IN A SINKING CITY

Abstract ID: 321

Group Submission: Spatial Politics at the Limits of the Urban

GOH, Kian [UCLA] kiangoh@ucla.edu, presenting author

Shifting interfaces of land and water – sometimes defined, often indistinct – expose the fault lines and gradients of power in cities. Urban water offers spaces of possibility and threat. In rapidly growing cities facing chronic flooding due to land subsidence and climate change-related sea level rise, the conflicts around such urban spatial politics are determined by decisions made on watershed management, land development, and water infrastructure and provisioning. They are subject to contestation between city officials’ objectives for development and modernization, and the struggles of marginalized urban residents living in low-lying coastal and riverine areas. The multiplicities of urban water take on different forms depending on point of view. Urban water is biophysical, involving geology, geography, meteorology, and ecology. It is an issue of governance, involving the planning, implementation, and maintenance of infrastructure and land use. And it is sociopolitical, involving historical social and spatial marginalization and evolving contestation.

These interrelated issues, exacerbated by the uncertainties of climate change, often confound efforts to propose effective and just planning solutions to flooding. This paper makes sense of urban waterscapes by tracing the conceptual and physical contours of flooding across these conflicting ideas and narratives. It follows the hydro-politics of water along one river, the Ciliwung, and its watershed in Jakarta, Indonesia, a city that is literally sinking as it confronts social striation and ecological catastrophe. It looks at the increasingly dire flooding conditions, the large-scale urban infrastructural projects meant to address the problems, and the protests and “counterplans” by grassroots activists.

Taking cues from environmental ethnography, the study uses a mixed methods approach involving observation, interviews, and visual methods at varying points along the watershed. It brings into dialogue theoretical frameworks – and underlying modes of knowledge – from landscape ecology, urban political ecology, and urban anthropology to explore the interrelationships between the biophysical and sociopolitical factors behind urban flooding. The paper analyzes the materialities and scales involved in planning for urban flooding, including the ecological scales of the watershed, the infrastructural scales of flood protection implementation, and the global-urban scales of planning and development, governance, and social activism. It concludes with a proposition for a hybrid, multi-dimensional approach to thinking and acting on problems of urban ecological change.

HOW CO-PRODUCTION AND INFORMALITY SHAPE THE SPATIAL POLITICS OF ACCESS TO WATER AND SANITATION IN AFRICAN CITIES

Abstract ID: 1167

Group Submission: Spatial Politics at the Limits of the Urban

ACEY, Charisma [University of California, Berkeley] charisma.acey@berkeley.edu, presenting author

Despite global reports of progress towards reducing the vast numbers without access to improved sources of water and sanitation, 844 million people lack basic water service (access to an improved source within 30 minutes) and 2.3 billion lack access to basic sanitation (improved forms where excreta is not safely managed). Those numbers

greatly underreport access when equity and human rights indicators like affordability, quality, reliability and acceptability are factored in. While the MDG goals focused on improved and unimproved sources and newer water and sanitation targets under the Sustainable Development Goals (SDGs) focus more on equity, scholars have uncovered important sources of disparities to basic services like water and sanitation. Development studies scholars have noted how political processes and institutions manufacture scarcity in ways that disadvantage the poor and the poor outcomes of the wave of new management reforms of public services that focus on marketization and insulation of the state from society (Mehta et al. 2014; Herrera and Post 2014). On the other hand, human rights scholars have wrestled with the important role of non-state actors (from multinational corporations to civil society to militia) in defining their responsibilities as duty-bearers to respect, protect, and fulfill their obligations under the international human rights framework.

Critical urbanists have looked at self-organization and shadow provision of basic services in developing countries as forms of insurgent, subaltern urbanism (Miraftab 2009; Caldeira 2017; Holston and Caldeira 2008), while urban political ecologists focus on how contestations over class and power shape and impact people and environment (Swyngedouw 2009; Keil 2015). Elinor Ostrom's pioneering work on coproduction opened a new field of inquiry that has animated social science research on a wide range of institutional relationships (Ostrom 1996). On the other hand, conceptual ambiguity and political realities have some scholars questioning if coproduction further imposes state responsibilities onto the backs of vulnerable populations under the guise of democratic governance and cooperation (Allen, Dávila, and Hofmann 2006) with others seeing it as an opportunity for political influence and social transformation (Mitlin 2008). Among hundreds of papers on coproduction in various domains, most look at what influences it and not on outcomes, nor how it works in challenging environments where institutional arrangements are "unorthodox" or "hybrid" (Joshi and Moore 2004). In particular, scholars have not yet fully explored the importance of citizen co-production in water and sanitation in developing countries, particularly the broad range of actors (variously classified as formal or informal, state and non-state) involved in basic services delivery, nor the real variation in who is included and excluded in planning processes around infrastructural services. Without understanding how co-production and informality shape the planning and provision of basic services in these contexts, we are left with an inadequate analysis of barriers to realizing human rights and a continued cycle of declarations and reforms that fail to deliver the most essential of services to the most vulnerable and marginalized. We also miss out on how urban citizens in the Global South are transforming their access to services by creating new opportunities to voice and negotiate their demands and rights to water and sanitation.

Drawing from archival sources, surveys and household interviews carried out in cities of Nigeria and Kenya between 2015-2017, this paper examines the tension between co-production and the complex patterns of formal and informal governance structures regulating access to water and sanitation services across neighborhoods in rapidly growing cities. I use the findings and cases to develop a typology of the forms and outcomes of co-production in one instance of African urbanism, the "self-service city."

RURAL URBANIZATION: BUILDING PEACE AND NATION IN RWANDA

WENDEL, Delia [MIT] wendel@mit.edu, presenting author

As prototypes for urbanization in the rural domain, Rwanda's model villages reveal cities-in-the-making that are founded on a peacebuilding and developmentalist ethos to build a new, post-genocide nation. Still inhabiting the long shadow of the genocide, 30 government model villages—one per district in Rwanda—have been designed to remedy deficiencies in peacebuilding and development. These idealized settlements were designed in 2009 as part of the country's Integrated Development Program (IDP). Described as an economic development project that integrated the good governance initiatives of a newly decentralized administration, the IDP is one of several government projects that link development progress to peacebuilding work. Model villages represent the smallest scale in a series of nested administrative territories that connect families to national concerns. Rural urbanization creates conditions for land consolidation and agricultural efficiency, and are tethered to projects of “integration, peace, and security” in Rwanda and the surrounding Great Lakes region. Model villages are thus uniquely positioned to reveal relationships between urban and rural domains in the most densely populated country in Africa, which has only, in the last 20 years, endeavored to develop a nation-wide urbanization strategy.

This paper provides an ethnographic and historical view of one model village in northern Rwanda to explore the intersections between urban development, nation-building, and peacebuilding. In this “urban village,” relocated residents enacted strategies to render themselves “ordinary”: dutiful citizens that pronounce their affiliation with state development policies and do not attract unfavorable attention from the government. This ordinariness is in one sense reproduced as placelessness—a sameness that derives from the settlement's technocratic administration and homogeneous spaces. Rural communities are “sensitized” to uphold urbanization as a value and a means to improve quality of life. This is also a placelessness that shuns relationships between identity and region; that strategically suspends associations to a history of northern political extremism and power. Residents' construction of ordinariness arises from an interest in negative rights: the right to be left alone, to not be implicated in a history of a region, and to participate equally in national development objectives. It is furthermore an ordinariness that is incapable of denying this history. It is actively constructed by compensating for national losses during the genocide and positioning residents as model citizens willing to apologize and recompense for the wrongs of others. Doing so seeks to demonstrate that residents are worthy of urbanization benefits. The village reveals a case in which citizenship is not only defined by building and living in Rwanda's model villages. To be a model citizen here is to assume the burden of government expectations and a nation's narrative of a region, and to attempt to repair that image through accord and labor in service of village construction.

PRE-ORGANIZED SESSION SUMMARY

DISASTER, CRISIS, RESILIENCE AND PLANNING IN A CHANGING WORLD, THE CROSS-CULTURAL PERSPECTIVES FROM ASIA AND THE US

Summary ID: 30

Abstract ID: 442

Abstract ID: 444

Abstract ID: 445

Abstract ID: 446

Abstract ID: 731

The session intends to invite the urban planner and researchers from China, India, Singapore and the USA to elaborate the role of planning in the post-disaster and post-crisis decision making process to evaluate the natural disaster responses, adaptive governance, community resilience, and economic capacity in the post-crisis era. Three aspects of issues will be addressed. First, what is the role of planning and how does the role of planning play in the decision making of the public policy in the context of post-disaster and post-crisis era? Secondly, what are the short-term and long-term outcome of the planning and policy? Thirdly, how does different planning and policy work in the cross-cultural context? What could be learnt through different contexts and international settings? It intends to provide a research collaborative platform between Asian research institutions and American experts on post-disaster and post-crisis governance and urban resiliency to provide a communication platform for mutual learning among all participants.

Objectives:

- The session intends to invite the urban planner and researchers from China, India, Singapore and the USA to elaborate the role of planning in the post-disaster and post-crisis decision making process to evaluate the natural disaster responses, adaptive governance, community resilience, and economic capacity in the post-crisis era.
- The main purpose of the session is to provide a research collaborative platform between Asian research institutions and American experts on post-disaster and post-crisis governance and urban resiliency in a changing world to provide a communication platform for mutual learning among all participants.

ECONOMIC RESILIENCE AND DISASTER RECOVERY IN POST-WENCHUAN EARTHQUAKE OF CHINA

Abstract ID: 442

Group Submission: Disaster, Crisis, Resilience and Planning in a Changing World, the Cross-cultural Perspectives from Asia and the US

YI, Fangxin [National University of Singapore] francineyi@gmail.com, presenting author

TU, Yong [National University of Singapore] rsttuy@nus.edu.sg, co-author

For the past ten years, Wenchuan earthquake is considered to be one of the largest and most influential earthquake in China. After the Wenchuan earthquake, a large scale of planning and reconstruction have been initiated in terms of Paired Assistance to Disaster Affected Areas (PADAA) programme to achieve the post-disaster planning and reconstruction. The research intends to elaborate the short-term and long-term outcome of the PADAA policies for post-disaster planning and large scale of reconstruction in China. The research intends to answer (1) what are the mechanisms through which post-disaster governance makes impact on the recovery in the post-disaster context? (2) How does Paired Assistance to Disaster Affected Areas (PADAA) programme policy make impact on the recovery? (3) How do post-disaster financial packages make impact on the recovery? What are the disaster recovery outcome and economic resilience after the policy?

In order to answer the question, the research groups the 310 comparable counties into four categories: the non-damaged counties, the counties that are damaged but not under government reconstruction plan, the damaged counties under the government reconstruction plan, and the PADAA supported counties. The research first construct indexes for the economic and social outcomes of the four categories of counties to reveal their short-term recovery; secondly, it adopts the same method to compare their long-term recovery; thirdly, it adopts a counterfactual analysis to estimate the impacts of the PADAA from economic and social perspectives.

Our preliminary findings are as follows. Firstly, the PADAA boosts the short-term economic recovery of the assisted counties. But in the long-term, the economic growth is not sustainable with high debt growth and social fixed asset investment crash after the PADAA. Secondly, the PADAA quickly stimulated the social recovery both

in the short-term and long-term. Thirdly, the PADAA has enhanced the social resilience of the residents as we see robust growth in the number of primary and middle school students.

The empirical findings suggest that the PADAA stimulates the recovery from both social and economic perspectives, but it also causes over-investment. The country's top-down political system enables the central authority to mandate the provincial and local governments from more economically developed regions to assist devastated areas with post-disaster reconstruction through the PADAA programme. The unconventional disaster recovery governance in terms of PADAA is considered to be a 'multi-level moderated competition' process (Zhong and Lu, 2017), and it is differentiated from other democratic countries, which focuses on the planning phases for stakeholder interaction to achieve agreement in the disaster recovery research. Under the policy, it is possible that the moderated competition system works to overreact by donor provinces or cities and over-competition among donor provinces or between cities. The empirical results show that the intensity of disaster relief support increase the economic and social resilience within a few years after a disaster as governments return to previous routines that help to well suited for long-term post-disaster support. But other ways of embedding disaster risk reduction and reliance in routines of governance are still needed in an age of increasing frequency and impacts of disasters. It brings about new knowledge and implications on the economic resilience of post-disaster reconstruction influence on the disaster recovery in the developing context (Adam and Liao, 2005; Adam, 2007; Campanella, 2006; Xiao, 2011).

PARTICIPATORY PLANNING AND LIVELIHOOD RECOVERY IN THE POST-DISASTER RECONSTRUCTION OF YUSHU IN QINGHAI-TIBET PLATEAU OF CHINA

Abstract ID: 444

Group Submission: Disaster, Crisis, Resilience and Planning in a Changing World, the Cross-cultural Perspectives from Asia and the US

DENG, Dong [China Academy of Urban Planning and Design] deng9393@sina.com, presenting author
YI, Fangxin [NATIONAL UNIVERSITY OF SINGAPORE] francineyi@gmail.com, co-author

China has experienced Yushu earthquake in 2010, which occurred on the Yushu fault of Qinghai province, in the northeastern part of the Tibetan Plateau with over 4000 meter high altitude. The post-disaster reconstruction of Yushu has the participatory features which are the most unusual and worth of attention. In the planning literature, scholars have long emphasized the importance of public participation in planning practice and policymaking in the post-disaster context, and special attention has been paid on the failure of public participation, modes of public participation (Ganapati and Ganapati, 2008) and the non-traditional mode of participation in urbanizing China (Chandrasekhar et.al, 2014). Seldom research has been paid on the outcome of livelihood recovery under the different planning approaches, participatory or non-participatory. The research intends to not only offer a unique case of participatory planning in the post-disaster reconstruction in Qinghai-Tibet Plateau, but also argue that while physical repair is always required, equally important are concerns about loss of livelihoods and community support and impacts on families that can too long endure. Social resilience,

economic resilience are also important components when considering the sustainability of public policy and planning approaches.

The studies intend to compare the livelihood recovery outcome of different planning approaches to investigate the relationship between planning modes and livelihood recovery. It intends to explore the answers to the following questions: (1) Can the post-disaster participatory planning help to recover the livelihood of the earthquake survivors; (2) How does the participatory planning affect the livelihood and what factors contribute to the change of livelihood, if any; (3) What implications can be generated to the post-disaster planning and reconstruction in the developing context; (4) What lessons could be learnt through the participatory process of post-disaster reconstruction process.

The analysis will use both quantitative and qualitative analysis to investigate the relationship between participatory planning and livelihood recovery. First, it intends to use the interviews of stakeholders and government documents to explore the learning and policy-change processes to show the participatory process. Secondly, learning from the Scoone's (1998) livelihood framework, it will use the survey questionnaire with ten components to identify the relationship between planning mode and livelihood recovery, including planning mode, participatory and non-participatory, housing type, perception of reconstruction, change of physical assets, change of social assets, change of natural assets, change of financial assets, change of human assets, to represent the livelihood context, livelihood resource, livelihood strategy, livelihood process and the livelihood outcome. The interviewees will be the heads of households from selected communities with different levels of participation. We expect to find that the livelihood changes of earthquake survivors are beyond recovery from the disaster losses. And the participatory planning outcome could be evaluated with livelihood recovery with the comparison of other post-disaster planning in the international context to bring about new knowledge in the literature (Berke, et.al, 2014).

EVALUATING URBAN RESILIENCE IN CHINA BASED ON INDEX SYSTEM

Abstract ID: 445

Group Submission: Disaster, Crisis, Resilience and Planning in a Changing World, the Cross-cultural Perspectives from Asia and the US

ZHAI, Guofang [Nanjing University] guofang_zhai@nju.edu.cn, presenting author

In recent years, China is experiencing a rapid development period of urbanization. As economic and social activities are highly concentrated in urban area, the urban risks are increasing. Traditional way of urban disaster prevention can't meet the needs of urban safety. How to improve urban resilience to reduce the risks is attracting more and more attentions from all over the world. This study aims to construct an index system for general urban resilience applicable for China and then apply it to evaluate the Chinese cities to understand urban resilience and its improving strategies.

The first step is to construct an index system for resilience evaluation. After a brief literature review of Baseline Resilience Indicators for Communities (BRIC), 100ResilientCity index system and etc, the research establishes an index system for urban resilience evaluation from six categories (social, economic, infrastructure, institutional, community and environmental) and 32 indices for evaluation China's urban resilience. The weights of each index of evaluation system are calculated by using analytic hierarchy process (AHP) and entropy weight method. The differences in China's urban resilience are grouped into five grades based on the standard deviation: low resilience, relatively low resilience, moderate resilience, relatively high resilience and high resilience. Data used in the study is with the year of 2014 and 288 statistical units which are prefectural cities. Some cities like Hongkong, Macau and so on are excluded due to data shortage.

The study shows that the general level of China's urban resilience is relatively low, and there is remarkable difference among different cities. Urban resilience has a spatial difference and has a significant positive correlation with city size. The findings implies that China should make every effort to improve urban resilience by re-structuring administration system, increasing relative investment, strengthening urban infrastructure, promoting social organization and improving insurance system. It makes contribution to the current resilience index and resilience assessment in the international settings.

Disaster resilience gains its popularity in the study of emergency management and related fields but still faces challenges of its multiple definitions and measurements (Mayunga 2007). At the same time, local public decision makers are facing the challenges of higher demand in public service but lack guidance to utilize limited resources available to them. The disaster resilience can become an opportunity for public decision makers to fix such a dilemma without torturing the scarce resources if the existing public service provision can be better organized (Tidball et al. 2010). In observance of this potential, we articulate the dilemma within a community in promoting resilience, propose a theoretical model presenting the dynamic structure in public service provision, and examine the current and possible solutions to mobilize the “hidden” resources toward community disaster resilience. Our preliminary study compares the local efforts of planning and responses to Hurricane Harvey (2017) and Jiangsu Tornado (2016) by reviewing the government documents and by interviewing the key personnel. The findings confirm the existence of mobilizing non-emergency resources during emergency phases on both supply and demand sides. The preliminary results also reveal that both structural and nonstructural planning are critical to reserve the capacity “potential” in the public services that are typically not considered emergency-related. On a

side note, the overall political stances of taxpayers that affect the local revenue are a strong indicator of this potential on the demand side of the theoretical model.

ROBBING THE POOR TO PAY THE RICH? SOCIAL AND ECONOMIC RESILIENCE OF THE CONCURRENT HOME OWNERSHIP RESTRICTION IN SINGAPORE IN THE POST-CRISIS ERA

Abstract ID: 731

Group Submission: Disaster, Crisis, Resilience and Planning in a Changing World, the Cross-cultural Perspectives from Asia and the US

TAN, Khee Giap [Asia Competitiveness Institute, Lee Kuan Yew School of Public Policy, National University of S'pore] spptkg@nus.edu.sg, presenting author

ZHANG, Yanjiang [National University of Singapore] zhangyanjiang@u.nus.edu, primary author

YI, Fangxin [NATIONAL UNIVERSITY OF SINGAPORE] fangxin.yi@u.nus.edu, co-author

This research argues that the concurrent home ownership restriction undermines the resilience development of the housing market and it may robs low-income home renters but subsidizes high-income renters in the Singapore housing market. It argues the social and economic resilience of the housing policy responses and challenges facing Singapore in the Post-Crisis Era. It intends to contribute to the housing literature through the investigation of the post-crisis housing policy in the international context (Landis and McClure, 2010; Zhang and Wu, 2016; McClure, 2017).

Singapore has two housing sectors, the public housing sector (also called HDB), and the high-end private housing sector. The two sectors are not geographically segmented. The HDB is subsidized by the government and has lower quality in neighbourhood environment and building design. The HDB homes around 80% of the residents. The private homes are not subsidized, have better structure the neighbourhood quality, and each project development is enclosed and not accessible by non-residents. The private sector homes the rest relatively high-income residents. Thus, the prices and rent rates of the HDB are much lower than an equivalent private home. The renters in HDB are mainly the relatively low-income foreigners and the renters in the private homes are mainly the high-income renters.

To curb the escalation of housing prices, on Aug 30th, 2010, the Singapore government implemented the concurrent home ownership restriction. It bans the private home owners from buying resale HDB homes and requires that a private home owner who buys a HDB home after Aug 30th, 2010 should sell the private home within 6 months. It also extends the minimum occupation period (MOP) of HDB owners before they can buy another private home.

This policy twists the two market sectors. It reduces the potential supply of rental HDB homes by stopping private home owners from buying HDB homes and also by forcing the HDB owners to occupy the HDB homes for longer time of period before they can buy private homes and lease out the HDB. Besides, the policy adds to the supply of rental private homes because few private home owners really like to downgrade from private homes to staying in HDB homes, and they are forced to invest only in private homes which adds to the supply of rental private homes.

Empirically, we use difference-in-difference method, and find that: firstly, private housing prices are relatively raised while HDB resale prices are relatively reduced, this is consistent with the findings of Diao, et al. (2018); secondly the rent rates of the private homes are relatively reduced while that of the HDB homes are relatively raised. Besides, we also find that the vacancy rate of the private homes is raised while that of HDB is stable. Lastly, we adopt a scenario analysis method to calculate the additional rent the HDB tenants need to pay and the rent savings that the private home tenants realize.

Our findings have implications for housing markets beyond Singapore. Countries like China also take the purchasing restriction as a major tool to cool its regional housing market down (Sun et al., 2016). The side effects we find in the Singapore experiment implies that the purchasing restriction will twist the equilibrium between the restricted housing sector or region and the unrestricted regions. Besides, it also has implications on how to avoid harming the social resilience of low-income migrants (Wang, et al., 2015) who are more likely to be home renters.

PRE-ORGANIZED SESSION SUMMARY **GLOBAL DISPLACEMENTS & REFUGEE URBANIZATION** Session ID: 34

Abstract ID: 453

Abstract ID: 454

Abstract ID: 455

Abstract ID: 1016

We live in an era marked by unprecedented movement and crisscrossing of capital, labor, and populations. The varied and intense contemporary processes of global displacement have profound implications for cities and citizenship. For example, in the context of the current geopolitical struggles and wars waged in the Middle East, we witness cities obliterated and others erected overnight as refugees' temporary camps, which only become permanent human settlements. In this processes of "refugee urbanization" people as stateless in-between subjects do not cease their practices of citizenship. But what forms and shapes do these practices of citizenship from below take? What new organizations and relationships govern these urban forms and their inhabitants' interactions? Solidarity and humane citizenships? White citizenship and propertied citizenship? Displacement and displaced people, whether produced through financialization of cities or through climate change, war, economic and/or gender violence, and/or immigration present complex dynamics with particular spatiality and politics that need interrogation. In this panel, we aim to do that.

Objectives:

- Interrogating the relationships between rising global displacements and new forms of urbanization

SLUMS AS CAMPS

Abstract ID: 453

Group Submission: Global Displacements & Refugee Urbanization

HUQ, Efadul [University of Illinois at Urbana-Champaign] ehq2@illinois.edu, presenting author

MIRAFATAB, Faranak [University of Illinois at Urbana-Champaign] faranak@illinois.edu, primary author

Over 2 million Bangladeshi slum inhabitants are rural to urban migrants. In development literature, landlessness, climate change, soil erosion, environmental disasters, and unemployment are the oft-cited reasons for rural to urban movement. However, others have studied the finer dynamics of displacement in Bangladesh and cautioned against depoliticized explanations of displacement in the context of Bangladesh's neoliberal development (Feldman, Geisler, 2012). In Dhaka, the country's capital, hundreds of thousands of migrants lack formal access to basics of life: housing, utilities, healthcare, education, and so on. Living in spaces that are socially porous but economically confined, rural migrants work as garments factory workers, domestic aids, rickshaw pullers, and provide labor for many sectors critical for the functioning of the city. In public perception migrant settlements are seen as permanent strongholds of criminal activities, and in the state's perception the same settlements are considered temporary arrangements for people who will move back to their origins in the future. Building on existing research that problematizes the older dichotomies of voluntary/involuntary movement (King, 2002), this paper looks at Dhaka's migrant slums with concepts developed in planning literature around refugee camps and shows the migrant settlements as captive labor camps. In Dhaka, migrant workers are offered IDs at work but are not provided formal addresses, which bars them from accessing basic services such as utilities. Political campaigns aim to secure migrants' votes as citizens, while migrants' constitutional right to shelter remains unacknowledged. Instead, mass evictions and arson are common practices of displacing migrants from urban land slated for private and public development projects. Migrant slums are permanently moving throughout the city but as a whole are not temporary. This paper examines testimonies of migrants and the processes of migrant slum making/breaking underway in Dhaka, a post-colonial megacity, and brings to focus the neoliberal logics of calculated exclusion, partial citizenship, permanent temporariness, and state and market violence to contribute to the growing comparative literature on refugee camps as an emerging urban feature.

SEEING THE CITY AS A MOTORBIKE RIDER PRACTICES OF SYRIAN MALE REFUGEES IN BEIRUT, LEBANON

Abstract ID: 454

Group Submission: Global Displacements & Refugee Urbanization

FAWAZ, Mona [AUB] mf05@aub.edu.lb, presenting author

As our understanding of the categories of displacement shift away from temporary crisis, national belonging, and encampment to recognize the protracted nature of refugee displacement and its urbanization, there is need to articulate new frames through which we conceptualize forced population mobility and its consequences for the government and planning of today's cities (Fawaz 2016, 2017). Against the imaginary of a population protected by a legal status of “refugee” and supported by international relief, hundreds of thousands Syrian refugees in today's Beirut (Lebanon) navigate the complex landscape of a city where their presence and labor is criminalized

through the impossible requirements of legal residency while their only means of survival is “work” they compete over with other refugee populations, migrant workers, and impoverished Lebanese individuals.

In this research, we map the trajectories of 35 “food delivery men”, individuals aged 24-45 years, to unravel through their experiences of navigating the city on motorbikes the processes through which they “learn” the variegated geography of Beirut and build competence in circulating within its sectarian and class divides as well as beyond militarized security. Our findings confirm the importance of a thick web of social networks that builds on the history of labor migration through which the presence of Syrian men in Beirut has been historically inscribed: Syrian men learn landmarks and strategies of police avoidance from older relatives and rely on social media and cellular communication for their wayfinding. Research findings further indicate that the nature of “delivery” work allows these men to negotiate an otherwise impossible mobility and visibility in the city, alongside other refugees and Lebanese men. Consequently, the shared experience of delivering food with motorbikes brings the men closer and ushers new forms of claiming the city based on class solidarity among individuals who resist policing and poor working conditions instead of the expected solidarity of “national belonging”.

These findings expand earlier arguments for refugee responses to shift from targeted subsidies based on individuals’ national belonging to neighborhood upgrading strategies in urban areas that recognize the shared experience of vulnerability among numerous urban populations (Fawaz 2017, 2018). They invite us to think about changing forms of city-zenship and innovative models of inclusive urban government, particularly in contexts such as Beirut where elected municipal officials and planning authorities have come to represent almost nobody.

REFUGEES, XENOPHOBIA, AND ANTI-IMMIGRANT POPULISM IN POST-ANC JOHANNESBURG

Abstract ID: 455

Group Submission: Global Displacements & Refugee Urbanization

WEINSTEIN, Liza [Northeastern University] l.weinstein@northeastern.edu, presenting author

Heralded as Southern Africa's immigrant and refugee haven since the end of Apartheid, Johannesburg appears to be becoming less welcoming to non-South African migrants under the city's current political regime. While anti-immigrant and refugee violence is not altogether new in South Africa's largest and most diverse city, Mayor Herman Mashaba-- the first in Johannesburg from the Democratic Alliance party -- had taken a more aggressive anti-immigrant stance than earlier administrations and utilized increasingly aggressive and exclusionary discourse. This paper draws on fieldwork in Johannesburg examining the context of anti-refugee violence (by both citizens and the local state) to analyze the conjuncture of the urbanization of refugees (and related questions of cities and citizenship), on one hand, and the city-level spatialization of right wing ideology and exclusionary forms of populist politics. How are these two broad global-level developments -- of displaced persons and right wing populism -- manifest at the city scale, and with what consequences? This paper analyzes the experiences of refugees in contemporary Johannesburg, including their ambiguous and precarious position vis-à-vis domestic and international policy, as well as the antagonistic or competitive relations they have with other marginalized or impoverished urban groups, amid the transformation of South Africa's political party structure and its leaders' increasing use of anti-refugee language to elicit support in an increasingly competitive political landscape.

HUMANITARIAN PLANNERS IN THE “CENTURY OF THE UNSETTLED MAN”

Abstract ID: 1016

Group Submission: Global Displacements & Refugee Urbanization

POTVIN, Marianne [Harvard University] mariannepotvin@fas.harvard.edu, presenting author

Rather than build rural refugee camps as they have traditionally done, international humanitarian actors now manage increasingly complex urban relief projects for refugees, disaster victims and migrants. In the process, their work seems to be shifting from crisis response to city planning. How do aid actors go from protecting individual lives to creating inclusive cities? How do they retain legitimacy as they take on roles, usually reserved to states, and surely at odds with their neutrality?

Scholars of the international humanitarian system have not theorized questions of urbanism and spatiality. Nor have urban scholars adequately historicized the contingent relationship between refugee protection and urbanization processes. This lack of periodization hinders attempts to properly situate today’s concerns within a longer history of what I call “Humanitarian Urbanism”. To begin to fill this gap, this paper traces the historical, institutional, and technological trajectories of the physical planning policies and tools that were developed and employed by the United Nations Refugee Agency (UNHCR), in the period starting from the internationalization of the refugee protection system in the 1960s, through to the late 20th century.

A first section examines the shift from a primarily legal endeavor explicitly concerned with the protection of European refugees displaced by World War II to a global project of humanitarian assistance taking new physical dimensions following forced displacement in the decolonizing world. As UNHCR’s mandate expands, the ‘field’ (meaning simultaneously the crisis zone, the remote, the rural, or the “Third World”) becomes its new terrain of intervention, opening new possibilities for planning and new arrangements with local stakeholders. A second section deals with the emergence of the concept of human settlements (or human “habitat”) as a new area of concern in international aid, and within the United Nations system as a whole, in the mid-1970s. For the first time in UNHCR’s history, explicit human settlements policies are crafted, and a Technical Support Unit created to manage its expanding planning activities. A third section traces the massive standardization of physical planning practices that occurs in the organization over the 1990s and 2000s, a move that goes hand in hand with changing attitudes towards refugee settlements, the question of “warehousing” (conflated with, though not equivalent to, prolonged encampments) and urban refugee protection.

Drawing on urban theory, as well as science technology and society studies (STS), this analysis triangulates between public-facing publications and archival material collected at United Nations Refugee Agency (UNHCR) and the United Nations Library.

PRE-ORGANIZED SESSION SUMMARY

THE RIGHT TO DECENT HOUSING AND URBAN RESILIENCE IN THE GLOBAL SOUTH

Summary ID: 45

Abstract ID: 1148

Abstract ID: 1149

Abstract ID: 1150

Abstract ID: 1343

Our panel will consider the relationship between "vivienda digna y adecuada," or "decent and adequate housing," urban resilience and climate change policy. The right to decent housing, as defined by the United Nations, is an increasingly important and contested idea as cities in the global south experiment with policy strategies concerned with urban resilience and climate change. These policy strategies might include mitigating GHG emissions through energy efficiency programs or relocating communities to adapt to more frequent flooding and landslide events. The general questions this panel will address include: 1) How is urban resilience and climate change policy influencing residents' access to decent housing? 2) And how is decent housing included in these policy frameworks? This panel will address these questions through a comparison of case studies from Mexico, Colombia and Indonesia.

Objectives:

- The concept of decent housing and its incorporation into the Climate Change /Urban resilience frameworks
- Reiterate decent housing and adaptation/mitigation to climate change as complementary objectives

RIVER NORMALIZATION FOR WHOM? THE DILEMMAS OF RIVERBANK INFORMAL COMMUNITIES IN INDONESIA

Abstract ID: 1148

Group Submission: The right to decent housing and urban resilience in the global south

PARK, Jaehyeon [University of California Los Angeles] jaehpark@ucla.edu, presenting author

As flooding risks increase in urban areas, Indonesian city governments recently began to implement so-called 'river normalization,' an engineering-based approach for mitigating seasonal floods and managing river space as public goods. However, this approach is controversial in that it causes the massive eviction and displacement of existing riverbank informal settlements. For example, there have been a number of arguments on the displacement of informal settlers along the Ciliwung River in Jakarta, Indonesia to public rental housing far from the original site. Also, squatters in Kampung Akuarium of Northern Jakarta had long resisted against the former Governor's demolition and relocation scheme, and very recently, managed to grasp a chance to come back to the original place thanks to their win at the court. These stories clearly show that the package of compensation and relocation to public rental housing offered by the state does not appropriately meet the needs of relocating informal settlers.

Within this background, this paper aims to examine the way in which river normalization has an influence on riverbank informal settlers' access to decent housing. Questions include: "how does river normalization interpret riverbank informal settlements as indecent housing?" and "how does river normalization constrain and/or support the housing choice of riverbank informal settlers?" To answer these questions, fieldwork was iteratively conducted in Surakarta City of the Central Java island between 2017 and 2018, involving document analysis,

interviews and field observations. By doing so, this paper aims to fill the gap between the right to decent housing and urban resilience.

The research finds that river normalization recognizes riverbank informal settlements as indecent based solely on their physical proximity to the river while ignoring the actual varying perceptions across the residents. Although river normalization is strictly implemented by the city government based on the central government's guidelines, it minimally considers the right of informal settlers to decent housing by adding an option of relocating to landed houses, albeit in off-city sites in nearby counties. Contrary to the state's typical laissez-faire or simplistic relocating to public rental housing, this more humanistic approach is justified by the city government due to the increased public benefits from clean and improved river space at the cost of informal settlers. However, from the perspective of relocating informal settlers, whether the condition of housing they would gain is tradable with their socioeconomic interruptions is still questionable. These findings will provide implications for dealing with the complexity of intersections between urban informality and urban resilience.

CLIMATE CHANGE AND DECENT HOUSING IN MEXICO

Abstract ID: 1149

Group Submission: The right to decent housing and urban resilience in the global south

GIOTTONINI BADILLA, M. Paloma [University of California Los Angeles] mpgiotto@ucla.edu, presenting author

The author analyzes the presence and relevance of the concept of decent housing in Mexico's strategies to address Climate Change. Using the Green Mortgage Program (GMP) as a case for analysis, the author explores the correspondence between the GMP, Mexico's Housing Law and Mexico's General Law of Climate Change. The Green Mortgage Program (GMP) is the largest and fastest growing effort to increase residential energy-efficiency in low-income households in the world. Since its implementation in 2011, it has facilitated the incorporation of energy efficiency appliances into more than two and a half million dwellings in Mexico. The GMP is part of Mexico's largest housing finance institution.

Using the United Nations International Covenant on Economic, Social and Cultural Rights (UN General Assembly, 1966) which defines decent housing in Article 11, the author analyzes three main issues related to the GMP: Firstly, the program increased the cost of housing by approximately 5-10% by incorporating the cost of the devices into the mortgage debt, therefore making housing less affordable. Secondly, the GMP is presented as a mitigation strategy to climate change in urban areas but provides no empirical evidence to corroborate that predicted reductions in greenhouse gases have been met. Thirdly, one of the goals of the GMP is improving the living conditions of its inhabitants, but two recent case studies (Davis et al., 2018; Giottonini Badilla, n.d.) show no difference between the living conditions of habitants of the GMP as compared to inhabitants of houses of similar characteristics which are not part of the program. These three premises guide two research questions

addressed by the author: is the GMP effective, and is the GMP equitable. The author uses existing research and analysis of official documents to answer the first two questions. The third question explores the role of the GMP in advancing the climate change, energy efficiency and emission reduction discourse in Mexico, and an analysis of the relevance of the concept of decent housing. This question is addressed through a discourse analysis of printed and online media, as well as semi-structured interviews to officials at the three levels of government, and the results of a survey of 150 inhabitants of GMP houses.

The findings show that the GMP has been ineffective at reducing energy consumption, therefore greenhouse gas emissions; and there is no significant improvement in the living conditions of its dwellers. The GMP is not equitable, as it increased the cost of housing for the lowest-income sectors of the population while providing no benefit to compensate for this increment. The GMP has been successful in advancing the regulatory context for energy efficiency in housing construction. Since its implementation, more than 20 new standards and regulations have been created by at least seven regulatory bodies in Mexico. The GMP has also accelerated the growth of a market for energy efficiency appliances, which would not have been possible without the financial support attached to it. The interviews to officials as well as the responses to the survey provide no conclusive findings in terms of a possible advancement in the discourse of climate change and efficient behavior in Mexico.

The results of this analysis add to an ongoing exploration of the effectiveness and equity of climate change mitigation and adaptation strategies for urban areas in the global south (Adger et al., 2003; Smit & Pilifosova, 2003). The results provide valuable information to urban planners and policymakers about the creation, implementation, and evaluation of housing, energy and climate change related policies; and also point to the urgent need to incorporate issues of quality and equity in the provision of decent housing.

LOOKING AT THE SPATIAL DETERMINANTS OF BOGOTA HUMANA'S RESILIENT HOUSING STRATEGY

Abstract ID: 1150

Group Submission: The right to decent housing and urban resilience in the global south

SARMIENTO, Hugo [University of California Los Angeles] hugos@ucla.edu, presenting author

Since the 1990s, the city of Bogota has pioneered disaster risk reduction strategies. Following this practice, during the Petro administration period (2012-2016), the city invested heavily in housing resettlements to recover and prevent construction in areas of zoned at risk of climate-related threats such as flooding and landslides. The goal of the city's development plan, Bogota Humana, was to develop a "resilient urban territory." The administration recognized these risks have been socially constructed through the exclusion of low-income residents from the formal housing market and the building of informal settlements in risk-laden topographies. Bogota's climate resettlements relied on two land-use and housing strategies: the use of risk zoning to mark the areas to be recovered, and the construction of social housing to provide alternative housing solutions. Moreover, the resettlements were prospective so that households could be resettled even if they did not face imminent threats.

However, ultimately, much of the city's new social housing was built in the extreme urban periphery, in some cases, in high risk zones. That is, resettled households often found themselves leaving behind homes which faced no obvious risk only to be relocated to social housing projects built in risk areas.

This apparent contradiction in Bogota Humana's land-use and housing strategy raises questions about the spatial relationship between risk zoning and the housing market in Bogota. How effective has risk zoning been as a land-use strategy to prevent new construction in ecologically sensitive areas? Has new construction in the city followed the spatial logic of risk zoning? Relatedly, what is the strength of market factors relative to risk zoning in determining where new social housing is constructed?

This paper addresses these questions through the findings of a logistic model which evaluates the relative effect of risk zoning, market (land values) and land-use on the construction of new social housing by comparing building permit data between 2006 and 2016. Data was provided by Bogota's Secretariat of Planning, District Cadaster Special Administrative Unit and the District Institute of Risk Management and Climate Change (IDIGER). The model's findings were supplemented with interviews of housing and risk management experts in Bogota. Data was collected over a year and a half as part of the fieldwork for a dissertation project.

This paper contributes to the emerging literature on resettlements as a climate change adaptation and urban resilience strategy. (de Sherbinin 2011, Ferris 2012) It aims to bring conceptual clarity and empirical depth to this new literature by closely examining the case of Bogota Humana. Social ecological systems (SES) theory, the dominant analytical frame in this field of study, defines resilience as the ability for SES systems to withstand external shocks, maintain functional persistence, through self-organizing and adaptive capacities. (Holling 1973) However, SES theory advances a value-neutral, systems-thinking, epistemology which ignores power asymmetries in social relations, and their economic basis in capitalist market dynamics. (Adger 2006) Borrowing from the emerging critiques of SES (Pelling 2011) this paper relies on political economy, examining the influence of the market on climate resettlements, to critically an example of growing investments in climate change adaptation.

ENERGY USE AND CLIMATE CHANGE MITIGATION IN MEXICO CITY'S COLONIAS POPULARES

Abstract ID: 1343

Group Submission: The right to decent housing and urban resilience in the global south

REYES, Ariadna [The University of Texas at Austin, Planning Department] ariadna.reyes@utexas.edu,
presenting author

Energy used for heating, cooling, and other household needs in residential buildings accounts for 30-40% of the world's total energy consumption, making household energy use in housing a fundamental component of climate change mitigation (Ramesh, Prakash, & Shukla, 2010). However, energy use in housing differ widely between low- and upper-income households (Rosas, Sheinbaum, & Morillon, 2010), exemplified by the distinction between wealthier communities and informal settlements such as the so-called "colonias populares" in Mexico City (Connolly, 2009; Ward, Huerta, & Di Virgilio, 2014). Despite the fact that colonias populares account for

most of the Mexico City's housing stock (Connolly, 2009), there is a poor understanding of the extent to which residents in these settlements use energy and thus contribute to greenhouse gas (GHG) emissions. The author explores the relationship between energy use and informal self-help housing in Mexico City's colonias populares. To that end, the author presents empirical results from her fieldwork conducted in Isidro Fabela, a colonia popular in Mexico City. Residents in Isidro Fabela pursue strategies that allow them to use less electricity, such as taking advantage of daylighting and natural ventilation. However, gas for water heating is particularly challenging to save because of the relatively cold mornings in Mexico City, which increase the hot water demand for bathing purposes (Giglio, Lamberts, Barbosa, & Urbano, 2014). Surveys on household energy use revealed that the gas bill is more expensive than electricity and water. Nevertheless, people in Isidro Fabela use comparatively less gas and water than upper-income residents in Mexico City. To save gas, residents take five-minute showers and some use buckets of hot water that they heat on the stove. Another obstacle to savings on gas usage is lack of access to technological innovations (Rosas-Flores & Gálvez, 2010); for example, most families use ineffective cylinder heaters that they operate manually. In their interviews, residents expressed great interest in acquiring energy-efficient and solar heaters to decrease the costs of gas. The author concludes that solar technological innovations may serve to mitigate greenhouse gas emissions and at the same time improve the household economy and the quality of life of families in Mexico City's colonias populares.

NATIONAL POLICY AGENDAS ENCOUNTER THE CITY: COMPLEXITIES OF POLITICAL-SPATIAL IMPLEMENTATION

Abstract ID: 91

Individual Paper Submission

BOLLENS, Scott [University of California Irvine] bollens@uci.edu, presenting author

This paper critically investigates the implementation trajectories of national political agendas in two distinct urban settings—Israel's program aimed at sole sovereign control of Jerusalem and Northern Ireland's effort to build peace in Belfast. The case studies are similar in political contestability but different in how public authority addresses the ethno-nationalistic conflict. I study the relationship over the past 24 years between national policy agendas and the spatial, economic, and social changes in these two cities. I research urban interventions that address economic development, borders, public services, urban violence, housing, development regulation, public space, and community participation. I examine how these urban policies and their impacts have influenced effectiveness in achieving national policy agendas.

The paper is based primarily on seven months of field research in 2015 and 2016. I undertook 122 interviews with urban professionals, political leaders, community and non-governmental organization representatives, and academic experts. I also investigated published and unpublished documents. Jerusalem and

Belfast illuminate the dilemmas and challenges faced by societies that are polarized by nationalistic conflict (Hepburn 2004). Both cities encapsulate deep-rooted cleavages based on competing arguments over sovereignty, provide multi-decade records of urban planning in contested bi-communal environments, and are embedded in long-term and uncertain peacemaking contexts.

This paper informs theoretical perspectives on the local implementation of national policy agendas. While Pressman and Wildavsky (1973) and others focus on the top-down structuring and design of policy implementation, Lipsky (1980) highlighted the role of implementing personnel in carrying out programs that are often underspecified. Scharpf (1978), and Sabatier (1986) describe how policy implementation involves the interaction of multiple actors throughout the chain of implementation which can have separate interests and strategies. Other scholars emphasize the urban political world as a complex arena of intersecting multiple orderings of authority whose coordination with one another cannot be assumed (Lucas 2017, Orren and Skowronek 2004). The interpretive approach emphasizes how policy goals are often formulated at an abstract level, creating for implementing actors a “struggle for the determination of meaning” in carrying out national objectives (Yanow 1996, 19).

I find disconnection between national political and urban spatial levels—between the abstract and the operational. Higher-level political goals by Israel and Northern Ireland are problematized as they are enacted in urban space. As abstract political programs confront micro-scale urban dynamics and resistant patterns of community power, their impacts become variant and contradictory. Difficulties in implementation of national policy agendas are partially rooted in the structural features of urban realities which act to thwart and redirect policies and agendas from above. There are inherent micro-level complexities of urban environments that are beyond the capacity of national policymakers to effectively address in ways implementable in urban space. In both Jerusalem and Belfast, the actualization of national goals is a social/spatial as well as political process that takes place over an extended period and is subject to obstructions and disruptions. Implementation of national policy agendas is jointly produced through the interaction of local, city-based, actors and national elites.

The political development studies theoretical approach to policy implementation is useful in understanding the Israel case. The implementation of Israeli national policy is characterized by different policies occurring which are at times consistent with national goals but at other times exhibiting unintended and counter-productive impacts on national objectives. In the Northern Ireland case, the interpretive approach to policy implementation provides insights as underspecified peacebuilding goals become stymied in their implementation by politically-motivated competing interpretations of national goals. The fact that national-urban disjunctions were found in fundamentally different national programs illuminates the inherent obstructive quality of urbanism in resisting and confounding national mandates.

Individual Paper Submission

In Indonesian cities, most poor residents live in spontaneous informal settlements referred to as *kampungs*. *Kampungs* are scattered throughout the city and have limited water supplies, inadequate drainage, narrow alleys and footpaths, and are characterized by the poor management of solid waste (Winarso 2010). *Kampungs* have small plots of land for each dwelling and low-quality building structures and materials. Most of the dwellings are constructed gradually by the residents from permanent and non-permanent materials, depending largely on what the residents can afford (Tunas and Peresthu 2010). Poor *kampung* residents are marginalized urban residents who occupy state land such as disposal sites, riverbanks, railway tracks, and private unoccupied land, illegally constructing their dwellings (Winayanti and Lang 2004).

Over the past decade, Indonesia has implemented three housing policies: (i) self-help housing policies such as the *Kampung Improvement Program* (KIP), the *Community-based Housing Development* (P2BPK), and *Self-help Housing Assistance* (BSPS); (ii) the *PERUMNAS* Program, the national program for public housing development; and (iii) the cross-subsidized housing policy, which is an instrument for balancing segmentation in the housing market and linking the growing number of high end houses to provision of more low-cost houses (Minnery et al. 2013; Tunas and Peresthu 2010). Despite these three housing policies, informal housing settlements remain a critical issue in many Indonesian cities.

The *Kampung Deret* Program is a new local housing program that builds low-rise apartment blocks for very low-income residents in Jakarta's *kampungs*. The program was initiated by the Jakarta City administration in October 2013 and gained considerable support from among the poor in Jakarta's *kampungs*. The program built nearly 4,500 permanent housing units for the urban poor in Jakarta in less than one year. The *Kampung Deret* Program aimed to create houses and an environment to provide ideal health standards and to assist residents obtain proper ownership documents.

This study offers a review of the self-help housing policy, the *PERUMNAS* Program of public housing development, and the cross subsidization housing policies. The discussion includes an account of housing finance and the interplay of the state and the market in housing outcomes. This study suggests that the three national housing policies have not addressed the issue of housing provision for the urban poor in Indonesia. This study then discusses how the *Kampung Deret* program differed from the three national housing policies for the Indonesian urban poor. The discussion includes a review of land tenure, funding and beneficiaries, the housing development process and changes in social and economic conditions. Using the case of *Kampung Deret* program, this study explores ways of moving beyond a focus on land legalization, self-help housing and government subsidies for addressing the housing problem for the poor in Indonesia. The main research question of this article is "What ingredients are important and have more impact on upgrading housing settlements for the urban poor in Indonesian cities?" The study concludes by offering some policy implications from the implementation of *Kampung Deret* program.

Data for this study derives from multiple sources, including interviews with three planners in Jakarta, three academics from the Bandung Institute of Technology and Trisakti University, a lawyer of the Jakarta Legal Aid Institute and some residents of the *Kampung Deret* program in the Petogogan Jakarta during a field trip in June-July 2015. The interviews have been supplemented with secondary materials from federal and local housing documents, published and unpublished reports, and newspapers and news magazine articles.

HOMELESS PEOPLE OCCUPYING PEOPLE-LESS HOMES: JUDICIARY-SPONSORED EVICTIONS IN BRAZIL

Abstract ID: 148

Individual Paper Submission

JAHN VERRI, Fernanda [UCLA] fjverri@ucla.edu, presenting author

This paper analyzes the gap between the legal framework on land use and judicial adjudication in Brazil. Despite having one of the most progressive land regulations in the world, approximately six million households do not have access to adequate housing in Brazil (Fundação João Pinheiro, 2017). The 1988 Federal Constitution declared housing an institutional right. The City Statute, promulgated in 2001, reinforced that property rights should be subject to the “social function” of urban land by creating mechanisms to prevent its underutilization through mechanisms like progressive estate taxation and adverse possession law. Officially, these new legislations enabled municipalities to demand owners of vacant urban parcels to promote their immediate use. These Decrees also produced the legal framework to ensure the right of individual and collective actors to claim the formal tenure of urban plots that have been occupied by them for at least five consecutive years. In practice, however, despite these legal apparatuses, judges are determining the evictions of thousands of families from abandoned private and public-owned buildings located in central areas of Brazilian cities.

There is a growing body of literature that argues that the banishment of the poor of the city is more than a simple outcome of housing commodification or a direct consequence of urban development projects led by the State (Caldeira, 2000; Roy, 2017). Some authors suggest that displacement is increasingly being endorsed and carried out by judiciary systems on behalf of aesthetics norms and “public interest” initiatives and at the expense of the criminalization of the poor (Gherner, 2011; Bhan, 2016). According to James Holston, the judicial process in Brazil has been “a means of manipulation, complication, stratagem, and violence by which all parties – public and private, dominant and dominated – further their interests” (2008, p. 203). The objective of this paper is to reflect upon the legal discourse that it is being used to support displacement in occupied buildings whose tenure security is supposedly guaranteed by federal legislation. In other words, my aim is to understand, as Gherner (2011, p. 131) puts, how eviction can be perceived as an “act of governance rather than violation”. At stake, is not only how public actors denied the right to housing to the urban poor, but more importantly how a legal rhetoric on land and apparatus of property put at risk equitable and democratic urban regimes.

I will ground my analysis in the case of Porto Alegre, conducting discourse analysis of the court records involving the repossession of the almost one hundred occupied buildings since the 1990s, when housing movements started to adopt this strategy in Porto Alegre. Porto Alegre is a paradigmatic case due its tradition in mechanisms of participatory planning. The city hosted eight editions of the World Social Forum, including the first one in 2001. Porto Alegre was also the first Brazilian state capital to adopt the Participatory Budgeting in 1989, a mechanism of participatory democracy that allows citizens to decide on municipal budget investments. At the same time that approximately 75,000 families have no access to adequate housing in Porto Alegre, the Brazilian Institute of Geography and Statistics estimates the existence of 40,000 vacant or abandoned dwelling units in the city. Although I do not have findings yet as I am still gathering documents from judicial archives, I expect to discover that there is a growing disparity between formal law and its application and that the Judiciary does not recognize the inclusive mechanisms created by the 1988 Constitution and the City Statute and still condemns informal arrangements of dwelling.

JUSTICE IN RESILIENCE? A REVIEW OF GLOBAL RESILIENCE INITIATIVES

Abstract ID: 175

Individual Paper Submission

FITZGIBBONS, Joanne [University of Waterloo] jmfitzgibbons@uwaterloo.ca, presenting author
MITCHELL, Carrie [University of Waterloo] carrie.mitchell@uwaterloo.ca, primary author

As cities globally deal with increasingly complex and interrelated problems such as climate change, the idea of building general “resilience” in urban systems is outpacing other policy frameworks in popularity. Yet, many scholars have cautioned that resilience is an inherently conservative (rather than transformative) concept which obscures issues of power and justice (Joseph, 2013; Meerow, et al., 2016; Ziervogel et al., 2017). To date, there has been little by way of in-situ or empirical findings to test these claims.

The Rockefeller Foundation's 100 Resilient Cities (100RC) program attempts to mainstream resilience thinking into city planning. We have taken this ongoing program as an opportunity generate empirical findings on how planners confront issues of justice and inequity in resilience planning, focusing on the global South.

To support our analysis, we draw upon Anguelovski et al.'s (2016) concepts of “acts of commission” and “acts of omission” to consider both procedural and distributive justice in a selection of 100RC city planning reports. Procedural justice processes such as negotiation and redistribution of power are necessary to generate the transformative systems changes that resilience narratives promise (Harris, Chu & Ziervogel, 2017). These procedural considerations also influence distributive justice by affecting spatial and infrastructure planning which, in turn, affect economic and resource inequities.

Using key informant interviews and directed content analysis of 13 “Resilience Strategy” reports, we examine whether and how the 100RC Chief Resilience Officers have understood and implemented principles of procedural justice in the development of their city's resilience strategies. Our findings suggest that resilience planning in these selected cities has not sought to radically transform power relations, nor focused explicitly on procedural justice. These findings will help guide future planners and policymakers to reflect on justice not only as an outcome for resilience, but also as a critical element in planning processes.

PLANNING NATIONALIZED OR NATIONALISM SPATIALIZED? THE PLANNING OF THE ANURADHAPURA NEW-TOWN IN 1949

Abstract ID: 187

Individual Paper Submission

SANGAPALA ARACHCHIGE DON DISSANAYAKE, Pradeep Dissanayake [University of Alberta]

sangapal@ualberta.ca, presenting author

AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, co-author

This paper attempts to explore how nationalism entered the Sri Lankan planning discourse, using master-planning of the Anuradhapura new town in 1949 as a case study. Anuradhapura is the most ancient, key sacred site for the majority of Sinhalese-Buddhists in Sri Lanka. It was also the first planned town in independent Ceylon (Sri Lanka after 1972) where Buddhism and nationalism met postcolonial spatial expression. The year after independence in 1948, the Ceylonese government inaugurated the Anuradhapura new town planning project on a site a few miles away from the location of ancient sacred monuments. The monuments were in ruins, but many people lived in the area. Structures that served daily routines, i.e., ‘secular uses’ of the inhabitants of the ‘sacred area’ – schools, markets, shops, and offices – were relocated to the new site. The sacred area was left with the remains of ancient monuments such as stupas and monasteries which belong to the first capital of Lanka’s ancient civilization, which has a history over two-millennia.

Influenced by Sinhalese-Buddhist revival movements of the late 1800s emerged a demand for a new town in Anuradhapura that would spatially separate sacred from secular. This spatial separation reflects religious revivalists’ beliefs in their authority to control the sacred space by removing or moving the non-Buddhist practices from the site. In the early 1940s, the revivalists’ claim for spatial separation and the stamping of the Sinhala-Buddhist will was politicized expressly by nationalist political elites, who demanded Ceylon be a Sinhalese-Buddhist state. The Anuradhapura new town planning project thus marks the location where the ‘colonial planning discourse’ (see Perera 2008, 2005) met the national consciousness.

By employing both archival materials such as political debates, newspaper reports, and the government correspondence (from early 1900s to mid 1950s), and the empirical data from fieldwork conducted in Anuradhapura during summer 2017, the study analyses the Anuradhapura planning discourse.

We aim to understand how the planning project negotiated different standpoints and tensions within nationalist politics and the needs of the emerging nation. We approach this project as a ground-up knowledge-building project in which the study of Anuradhapura new plan and the planning process may enable us to understand the influencing ideologies such as Sinhalese-Buddhist nationalism, how they were negotiated, and the potential impact of the planning process and the plan. Following the work of postcolonial urbanism (Yeoh 2001; King 2008), the findings of this study argue that planning in postcolonial cities is a complicated political action that is manipulated by historicity, religion, culture, and nationalist conceptualisation of space. Findings on Anuradhapura’s planning will be instrumental to understand crossroads between colonial and nationalist politics in shaping the modern planning and spatial ideologies in a postcolonial nation. However, the research produces a body of knowledge that has implications far beyond Sri Lanka’s geographical boundaries.

LAND USE CHANGE IN CHENGDU 2005-2016: CAN ACCESSIBILITY CONTROL SPRAWL?

Abstract ID: 222

Individual Paper Submission

SRINIVASAN, Sumeeta [Tufts University] sumeeta.srinivasan@tufts.edu, presenting author

GUAN, ChengHe [Harvard University] , co-author

China is currently experiencing the “Century of the City” (Seto et al, 2010). There are more than 100 cities where there is a population of over 1 million and 70% of the country's population is expected to be urban by 2050 (Seto et al, 2010). Chengdu, one of the largest cities in Western China, is the capital of the Sichuan province and has grown rapidly in the last 20 years. Local municipal authorities have adopted aggressive plans for growth (Schneider et al, 2005; Zeuthen, 2017). In a study in 2005 Schneider et al used satellite data for Chengdu from 1978-2002 to examine land use change for signs of sprawl. They found three spatial phenomena that suggest sprawl in the region: land-use specialization, clustering, and periurban development. More recently, Zeuthen (2017) and Gao et al (2016) note that the second wave of urbanization in Chengdu and other cities in western China is occurring at a considerable distance from the urban core. In Chengdu, the improvement of transportation infrastructure has been a key goal for the local government and several thousands of kilometers of roads have been built. The central government has also initiated the planning and development of a new CBD in the southern periphery and transit lines have been built to this new CBD since 2010. Much of the periurban development in Chengdu appears, therefore, to have been initiated by the planners.

Sprawl is of great concern because it results in people having to travel longer distances to access not only their place of employment but also non-work activities such as shopping, recreation and education (Yang and Gakenheimer, 2007; Zhao, 2010; Cervero, 2013). This is particularly relevant in China where urban structure used to be more compact and jobs in the local Danwei (work unit) were close to residences. At least one recent study (Feng, 2017) suggests that, with rapid urban expansion in China, the number of economic and social opportunities in a neighborhood have decreased rapidly, leading to poor accessibility for socially vulnerable groups like the urban poor. Improved accessibility to jobs could thus be used to influence more sustainable travel behavior through non-motorized travel modes as well as transit (Zhao and Lu, 2010). Shen et al (2016) note that rail transit-supported urban expansion can also produce important positive outcomes in integrating land use and transportation planning even as cities urbanize.

In this paper we study land use change in Chengdu in the last 10 years using Landsat satellite data for 2005 and 2016. We use metrics such as the mean patch size, landscape shape index, largest patch index, and Shannon's diversity index that have been suggested by other researchers (Schneider et al, 2005; Yue et al, 2013; Gao et al, 2016) to test for signs of continued sprawl-like urban development in the region. We then estimate the role of accessibility to employment through multiple modes including transit in predicting land use change using a multilevel logit model. Finally, we compare the travel behavior of households in a peripheral location which resulted from leapfrogging development with another peripheral location that has developed near existing urban development. We also pair several case study locations for land use and travel behavior changes between 2005 and 2016 using data from two travel surveys conducted in 2005 and 2016 in Chengdu.

Our initial findings suggest that proximity to transit and accessibility to employment could be a potential mechanism for cities in China and other developing countries to grow in a sustainable way.
